Horizon Europe

Work Programme 2025

1. General Introduction

IMPORTANT NOTICE:

This draft has not been adopted or endorsed by the European Commission. Any views expressed are the views of the Commission services and may not in any circumstances be regarded as stating an official position of the Commission.

This draft is made public before the adoption of the work programme to provide potential participants with the currently expected main lines of this work programme. Only the adopted work programme will have legal value.

The adoption of the work programme will be announced on the Horizon Europe website and on the Funding and Tenders Portal.

Information and topic descriptions indicated in this draft may not appear in the final work programme; and likewise, new elements may be introduced at a later stage. Any information disclosed by any other party shall not be construed as having been endorsed by or affiliated to the Commission.

The Commission expressly disclaims liability for any future changes of the content of this document.

About this work programme

Horizon Europe supports research and innovation (R&I) especially through *work programmes*, which set out funding opportunities for research and innovation activities.¹

This introduction covers the following components of Horizon Europe for 2025:

- Marie Skłodowska-Curie actions²;
- Research infrastructures;
- Health;
- Culture, Creativity and Inclusive Society;
- Civil Security for Society;
- Digital, Industry and Space;
- Climate, Energy and Mobility;
- Food, Bioeconomy, Natural Resources, Agriculture and Environment;
- European innovation ecosystems;
- Widening participation and spreading excellence, and reforming and enhancing the European R&I system;
- EU Missions;
- New European Bauhaus Facility.

In addition to the work programme parts mentioned above, the *General Annexes* to this work programme set out the general conditions applying to the calls of the work programme such as:

- eligibility rules;
- details on how to submit an application; and
- how the Commission services evaluate applications.

Getting started

Are you interested in applying for funding through Horizon Europe? You can find the topics that are currently open for applications on the [Funding and Tenders Portal](#) . The network of [National Contact Points](#) stands ready to answer any questions you might have on the application process in your own language.

You can also find more about the Horizon Europe programme at the [Horizon Europe web page](#).

Delivering on EU policy priorities

Europe's competitiveness - and its global leadership in becoming a clean and digital economy – depends on a new age of invention and ingenuity. Research and innovation are at the heart of this transformation, driving scientific breakthroughs and the development of critical technologies and innovative solutions.

With this work programme, the EU and countries associated to Horizon Europe will invest over 7.2 billion in research and innovation that delivers on the EU's ambitions to build a united, more competitive, fair and resilient Europe. A substantial part of this funding will be dedicated to targeted actions that support Europe's sustainable prosperity and competitiveness and its race to becoming a clean and digital economy.

With war inside Europe and the situation in the Middle East, this work programme will place a special emphasis on actions that contribute to build a safe and secure Europe, help reduce critical dependencies and build a more robust economic base through targeted actions.

This work programme for 2025 is a key step towards achieving the research and innovation priorities outlined in the [Horizon Europe strategic plan for 2025-2027](#). Its actions are expected to substantially contribute to the three overarching, interlinked key strategic orientations: *the green transition, the digital transition and a more resilient, competitive, inclusive and democratic Europe*. These orientations are aligned with the EU's main policy priorities as set out in [the Commission's Political Guidelines for 2024-2029](#) and folded out in [the Competitiveness Compass for the EU](#), all of which require significant contributions from R&I to meet their objectives.

Europe's research and innovation system depends on world-class **research infrastructures** that are open and accessible to all researchers in Europe and beyond. Through the dedicated work programme part, excellent research and breakthrough science and innovation will be supported with cutting-edge, interconnected, specialised and sustainable Research Infrastructures.

Concretely, this work programme includes actions under **Cluster 1 Health** aimed at advancing the foundations of preventive health and developing innovative therapeutic interventions for non-communicable diseases. Research opportunities range from exploring the health impacts of pollution and environmental degradation, to developing cutting-edge treatments, novel tools and technologies to address public health needs and reduce health inequities, taking into account vulnerable and marginalised populations. Several actions are dedicated to brain health, including mental health, with opportunities to address treatments for degenerative illnesses and advance research into autism.

Furthermore, actions will support research and innovation in biotechnology and artificial intelligence (AI) to improve healthcare. This includes advancing biotechnological tools to develop advanced treatment options and leveraging Generative AI models to accelerate biomedical research and speed up the transfer of biotech-based treatments from discovery to market approval. Several actions are dedicated to supporting the competitiveness of SMEs and help secure European leadership in breakthrough technologies. In addition, Cluster 1 will support actions, including Generative AI models, to enhance the resilience, sustainability and efficiency healthcare systems. Cluster 1 will maintain a strong focus on addressing pandemic preparedness, and antimicrobial resistance in a One health perspective.

Cluster 2 Culture, Creativity and Inclusive Society will work on equipping European societies to face today's most pressing challenges, linked with technological, demographic, and climate change, as well as a changing geopolitical landscape and a growing number of threats to our democracies. Actions will target increased hatred in society, mis-/disinformation and foreign interference, the polarisation of political debate, and the isolation caused by group dynamics on social media, to reinforce our democracies. Moreover, R&I will boost sustainable growth and job creation through cultural and creative industries and sectors and promote AI for creativity and innovation. A new European partnership for Resilient Cultural Heritage will be launched, focusing on the impact of climate change. Finally, researchers will be asked to find a way to make our societies more inclusive and fairer, by tackling gender-based violence, including online, promoting mental health and protecting vulnerable groups, advancing on competencies development and addressing emerging migration challenges.

The global economic system is fractured by geopolitical and commercial tensions. Organised crime in Europe is on the rise. Spikes in terrorist attacks prevent citizens from feeling safe. In line with the Competitiveness Compass, **Cluster 3 Civil Security for Society** will help address these challenges and support the work towards a new European Internal Security Strategy, a new Counter-Terrorism Agenda and new European action plans, notably against drug trafficking and for cybersecurity. Research under this Cluster will focus on projects for a safer, more secure and resilient Europe, securing critical infrastructures and protecting against hybrid and cyber threats, contributing to saving lives in emergency situations and strengthening Europe's borders, making them more secure and more fluid. Cluster 3 will also continue to support actions on preventing and preparing against natural and human-made threats, particularly those linked to chemical, biological, radiological and nuclear (CBRN) as well as risks to security from the impact of climate change.

Research to support the clean and digital transition and autonomous access to Space is key to Europe's competitiveness and open strategic autonomy³, to industrial sustainability and to setting human-centred standards. Thus, this work programme, and especially actions in **Cluster 4 Digital, Industry and Space** will support research and innovation in these areas. One of the key issues addressed is to develop safer, more trustworthy and human-centric Artificial Intelligence (AI), and in tackling the risks stemming from its misuse. Another one is the preparation of an in-space operations and services pilot mission, which will be key to ensure the sustainability of our EU space assets. All these initiatives will support the implementation of the Competitiveness Compass for the EU.

Horizon Europe will support through R&I the goals of the Clean Industrial Deal driving the decarbonisation of our economy and society, implementing the Competitiveness Compass for the EU, and promoting a more sustainable approach to production and consumption. These actions will help identify effective and efficient pathways, cross-cutting technologies, and solutions to address mitigation and adaptation to climate change, energy needs, and mobility challenges, including actions to support the **automotive sector package**. Due to the cross-cutting character of the Clean Industrial Deal, it will be supported by the climate relevant activities of Horizon Europe, in particular **Cluster 5 Climate, Energy and Transport** as well as the Industrial part of **Cluster 4 Digital, Industry and Space**.

³ 'Open strategic autonomy' refers to the term 'strategic autonomy, while preserving an open economy', as reflected in the [Conclusions of the European Council of 1/2 October 2020](#). It is further set out in the Communication from the Commission *Trade Policy Review – An Open, Sustainable and Assertive Trade Policy*, [COM\(2021\) 66](#).

Efforts will focus on ensuring affordable, sustainable, and secure energy supplies, the shift to more sustainable mobility options and transport modes, the decarbonisation of industry and circularity in manufacturing and process industries. Research and innovation will focus on leveraging digital technologies to improve productivity and help to close the skills gap, thereby improving Europe's competitiveness.

To enhance ecosystems and biodiversity on land and in waters in line with the commitments taken in the Kunming Montreal Agreement, actions in **Cluster 6 Food, Bioeconomy, Natural Resources, Agriculture and Environment** will focus on understanding and addressing the main drivers of biodiversity loss, developing innovative methods for biodiversity protection and restoration, and helping develop new biodiversity friendly practices in agriculture, forestry and aquaculture. Cluster 6 will help protect our natural world and contribute to climate action.

With a view to protect Europe's food sovereignty and to support the competitiveness of our entire food value chain, research and innovation will support long-term competitive, resilient and sustainable farming, fisheries and aquaculture. Communities in rural, coastal and urban areas will also benefit from R&I actions in this Work Programme. Actions in Cluster 6 will support the transition to a sustainable and competitive circular economy and bioeconomy and foster bio-based innovations. They will keep on focusing on increasing water resilience, sustaining a thriving blue economy and safeguarding ocean sustainability. This will contribute to the realisation of the new EU Circular Economy Act, the revised EU Bioeconomy Strategy, the new European Water Resilience Strategy and the European Oceans Pact. It will strengthen the EU lead on ocean governance, optimise the uses of the sea, protect coastal areas against climate change and enhance knowledge of emerging scientific areas such as blue carbon.

The **European Innovation Ecosystems** work programme plays an important role in putting research and innovation at the heart of our economy. It contributes to the creation of efficient and interconnected innovation ecosystems where disruptive innovation and the diffusion of digital technologies can more easily take place.

The European Research Area (ERA) envisions a single, borderless market for research, innovation and technology across the EU based on excellent, competitive, open and talent-driven research. The part **"Widening participation and strengthening the European Research Area"** supports the priorities set out in the Pact for Research and Innovation in Europe and is the driving instrument in the implementation of the ERA Policy Agenda. It will support a broad range of actions to unlock more of the potential of the ERA by tackling fragmentation of the R&I landscape, reducing geographical disparities in R&I performance, and building R&I capacity through institutional and structural reforms. While keeping excellence as the main feature, a wide spectrum of measures in the component "Widening participation and spreading excellence" will foster participation in the work programme actions and facilitate collaborative links. The actions in the component "Reforming and enhancing the European research and innovation system" will strengthen capacities of R&I actors in multiple areas, including institutional open access publishing, reproducibility of scientific results, reforms of research assessment, knowledge valorisation, inclusiveness and gender equality, research management, research careers, programme level collaboration, and science for policy.

In addition, out of the **nine new European Partnerships**⁴ announced in the strategic plan 2025-2027, eight are launched in this work programme aiming at federating national research and innovation efforts and increasing industry participation in Horizon Europe in key strategic areas.

EU Missions address some of the greatest global challenges that affect our daily lives. They have ambitious, clear and targeted objectives that are time-bound, realistic and measurable. They are rooted in research and innovation; they will employ a portfolio approach to tackle these challenges using instruments across diverse disciplines and policy areas in a coordinated way.

With this work programme, the Commission launches an investment of more than 652 million for 2025 in EU Missions. This investment will support research and innovation, which is expected to result in, for example, better-prepared local and regional authorities to face climate-related risks, the restoration of at least 25 000 km of free-flowing rivers, Climate City Contracts with 100 cities, the roll-out of robust soil monitoring programmes, and optimise minimally invasive diagnostic cancer interventions. These actions directly support key overarching EU priorities.

The Commission invites researchers, innovators, citizens and all interested stakeholders to take part in the following five Missions:

- **Adaptation to Climate Change:** support at least 150 European regions and communities to become climate resilient by 2030;
- **Cancer:** improving the lives of more than 3 million people by 2030 through prevention, cure and for those affected by cancer including their families, to live longer and better;
- **Restore our Ocean and Waters by 2030;**
- **100 Climate neutral and smart cities by 2030;**
- **A Soil Deal for Europe:** 100 living labs and lighthouses to lead the transition towards healthy soils by 2030.

As a cross-cluster issue, the **New European Bauhaus (NEB)** will support research and innovation leveraging the power of inclusiveness, sustainability, arts and culture to advance the green transition in neighbourhoods. More specifically, it will foster research and innovative solutions connecting the green transformation, social inclusion and local democracy; circular and regenerative approaches for the built environment; and innovative funding and new business models for the transformation of neighbourhoods.

International cooperation in research and innovation plays a key role in Global Europe through building and leveraging partnerships around the world to better address EU dependencies in strategic sectors, while promoting our values and principles. It is essential for tackling global challenges more effectively and underpins all the key strategic orientations of the Horizon Europe strategic plan 2025-

⁴ The partnerships launched in this work programme are:

- Brain Health
- Forests and Forestry for a Sustainable Future
- Raw Materials for the Green and Digital Transition
- Resilient Cultural Heritage
- Innovative Materials for the EU
- Solar Photovoltaics
- Textiles of the Future
- Virtual Worlds

2027. It enables Europe to access resources, know-how, scientific excellence, value chains and markets that are developing outside the EU. All parts of the 2025 Work Programme encourage international cooperation, with particular emphasis on dedicated initiatives for cooperation with Africa, Mediterranean and Latin America and Caribbean countries.

Association of third countries to Horizon Europe is an important element in international cooperation. [Nineteen countries](#) are currently associated to the programme, paying into the Horizon Europe budget and participating under almost the same conditions as EU Member States. Association talks are on-going with several other countries. Association is politically important, economically relevant and helps drive scientific excellence. As geo-political tensions continue to rise and intensify, association provides a framework to deepen our technology cooperation with those selected allies that share our concerns and values, in line with the [European Economic Security Strategy](#).

Towards a simpler, less prescriptive and shorter work programme.

In line with the Commission's overarching priority to simplify EU rules and enhance competitiveness, several measures have been introduced aiming to streamline the 'main' work programme 2025 and improve the experience of applicants and beneficiaries which include:

- Reduced length of the work programme by reducing the overall number of topics, shortening topic descriptions and minimising single-project topics.
- Keeping topics more open by being less prescriptive, leaving more freedom to applicants for different pathways towards expected outcomes.
- Increased use of simplified cost options. In the 'main' Work Programme 2025, lump sum grants represents more than 35% of the budget. By 2027, the intention is to fund at least 50% of the calls' budget through lump sum funding, taking into account the suitability for the supported actions.
- the revision and simplification of a number of non-financial obligations (such as the approach to the 'do no significant harm' principle and the check on the robustness of AI tools), resulting in a shorter proposal form.
- The 'main' Work Programme 2025 will feature 29 topics using two-stage evaluation. These will allow applicants to submit a shorter summary proposal and only submit a full proposal if successful at the initial stage.
- Around 20 of these topics will be evaluated blindly to collect additional evidence for a sound assessment of the **blind evaluation methodology**, as a method to avoid potential risk for bias.

The Commission is committed to continue its efforts to make work programme 2026-2027 even more simple, shorter and impactful.

Investing in the green and digital transition, climate action and biodiversity

In order to support our commitment to make the **EU the world's first climate-neutral continent by 2050**, Horizon Europe will spend at least 35% of the funding available contributing to climate objectives. The commitment to spend at least 35% of resources on climate action and strengthen investments in biodiversity applies to the entirety of Horizon Europe including the European Research Council (ERC), the European Innovation Council (EIC) and Institutionalised European Partnerships. These are not included in this work programme.

Taking into account all work programmes and planning documents for Horizon Europe 2025⁵ it is estimated that overall 35% of funds will contribute to climate action and 8.8% to biodiversity related policy objectives.

Actions supported by the European Union budget shall not do harm to environmental policy objectives⁶. As announced in the strategic plan 2025-2027 a new approach to 'do no harm' assessments shall be implemented in Horizon Europe from 2025 easing the workload of applicants to reflect on environmental effects of their proposals while maintaining a screening of all published topics.

The parts of the present work programme dedicated to the six clusters of Pillar II, 'Global Challenges and European Industrial Competitiveness', research infrastructures, widening participation & strengthening the European research area, European innovation ecosystems, the EU Missions and the New European Bauhaus Facility together contribute with over € 3150 million to climate action, equal to 47.3 % of the present work programme budget. Furthermore, these parts will contribute € 860 million to biodiversity, equal to 12.9 % of the present work programme budget. Over € 285 million of the contributions to biodiversity are from the activities described in the EU Missions. The investment in climate action is a good approximation of investments in the green transition, monitoring of expenditure will provide more precise data also on other aspects like investments in 'clean air' or specific SDGs.

Contributions to climate action are made by 93.5% of resources spend⁷ by cluster 'Climate, energy, transport' (€ 1.14 billion), 64.5 % by the cluster 'Food, Bioeconomy, Natural Resources, Agriculture and Environment' (€ 833 million), 32.5 % by the cluster 'Digital, Industry and Space' (€ 517 million), 28.3% by the cluster 'Culture, Creativity and Inclusive Society' (€ 101.8 million), and 6.3% by the cluster 'Health' (€ 50.8 million).

To ensure a contribution over 35% of the expenditure to climate objectives in the lifetime of the Horizon Europe programme, the expenditure estimates will be updated continuously. The methodology to generate these estimates is based on the 'EU-coefficients' methodology⁸.

In support of the digital transition, this work programme will foster research and innovation to make this decade **Europe's digital decade** and lay the groundwork to ensure that all actors in our society, including enterprises, master the complex interplay of technology and humankind, for a better, safer and inclusive society and life, fully respecting universal human rights and planetary boundaries. Using an EU- coefficient type calculation systems it is estimated that 40.4% of funds in the presented work programme equal to 2.7 billion, and 36 % of funds across all parts of Horizon Europe contribute to the

digital transition. The overall investment in topics that encourage the development of AI in 2025 is estimated at € 1.6 billion in 2025, this will be complemented by amounts deriving from projects that chose to develop AI-based approaches to conduct their research and innovation activities.

What you will find in this work programme

Each part of this work programme, except for this Introduction and the General Annexes, is designed around a series of coherent packages of calls for proposals and impact-driven destinations and topics.

Each **destination** describes socio-economic challenges to be addressed and the related expected impacts that R&I activities will contribute to.

In many cases, destinations correspond directly to an expected impact identified in the Horizon Europe strategic plan 2025-2027. Together, the destinations of this work programme cover the 32 expected impacts in the Horizon Europe strategic plan 2025-2027.

Under each destination, one or more **topics** describe the expected outcomes and the scope of the research and innovation activities to be supported. The **expected outcomes** are the desired effects of the project in the medium term such as the uptake, diffusion, use and/or deployment of the project's results by direct target groups. The **scope** describes the area of research/innovation that needs to be tackled if the expected outcomes are to be successfully addressed, without prescribing the method to achieve them. It is therefore up to the creativity and skill of the applicants to design a project that will generate results and substantially contribute to the expected outcomes and impacts.

Each topic also sets out the general conditions, deadlines, budget, and any specific conditions that may apply. The topics are grouped under calls for proposals, which is a technical term for a number of topics that share the deadline for the opening of the topic for submission of applications.

⁵ The Horizon Europe components European Research Council, Marie Skłodowska Curie Actions, the European Innovation Council, the European Institute of Innovation and Technology, as well as the Institutionalised European Partnerships based on Articles 185/187 TFEU and the direct actions by the Joint Research Centre have a combined budget of 12.043 billion equal to 46.81% of Horizon Europe total.

⁶ The relevant environmental policy objectives are defined in the [‘EU taxonomy regulation’](#)

⁷ To note: the work programme includes commitment to co-funded partnerships to be served by around €588 million from 2026 and 2027 budgets, of which €392 million in Cluster 6, €93 million in Cluster 1 and €68 million in ‘European Innovation Ecosystems’.

⁸ EU-coefficients are based on the internationally recognized Rio-markers methods originally developed by OECD (see further information [here](#).) The EU coefficients assigns 0-40-100% markers to actions and their budgets depending on climate action having a major impact (100%), a significant impact (40%) or a marginal impact (0%) of an activity. In this work programme the - coefficients are applied to every topic described for climate action, biodiversity, clean air, digital transition and artificial intelligence. For other parts of Horizon Europe they are applied to larger groups of actions and in general to awarded projects for expenditure monitoring and documentation. Actions can be assigned more than one coefficient if they contribute substantially to more than one of the related objectives.

Budget	92
Specific Features for Research Infrastructure	93

Introduction

The Horizon Europe Programme objectives are pursued through the Research Infrastructures part endowing Europe with world-class sustainable¹ research infrastructures which are open and accessible to the best researchers from Europe and beyond. This work programme supports activities to consolidate, evolve, open, integrate and interconnect a world leading ecosystem of research services for researchers in Europe, encompassing both national and pan-European infrastructures. The aim is to cover the continuum of needs from the creation of fundamental knowledge to technology development and innovation, while supporting open science. The programme is building on continuous policy development under the European Research Area, including the strategy-led approach and roadmap exercise of the European Strategy Forum on Research Infrastructures (ESFRI) and the use of the European Research Infrastructure Consortium (ERIC) legal instrument. The programme is highly relevant to the Political Guidelines for the next European Commission 2024-2029, which highlight that “to lead on innovation, we need to create the conditions for researchers to thrive. This means providing the infrastructure and innovative laboratories they need to test and develop ideas”.

The programme aims to improve the sustainability of the research infrastructures ecosystem and synergies amongst funding sources, support human resources and skills development for an optimal functioning of research infrastructures, and reinforce the international dimension of research infrastructures in particular with regards to shared global challenges.

Another key aim of the programme is to continue enabling transnational access to research infrastructure services with two main targets:

- curiosity driven research.
- challenge-driven research (also considering the development of new or customised services, to better serve interdisciplinary approaches).

It will also promote the educational and training dimensions of access to research infrastructures while making sure these activities do not come at the cost of already overbooked transnational access services. The programme also aims at fostering the uptake of research infrastructure services in other parts of the Horizon Europe programme, in line with the Pact for R&I in Europe and the ERA Policy Agenda.

The programme promotes collaboration in the upgrading and design of scientific instruments and tools, including through cooperation with industry and through creating research infrastructure innovation ecosystems. Reduction of the environmental footprint of research infrastructures is also a focus.

In line with the Strategic R&I Agenda of the 2021-2030 European Open Science Cloud (EOSC) co-programmed European Partnership, the programme aims at ensuring that Open

¹ Sustainable refers to the overall “capacity for a research infrastructure to remain operative, effective and competitive over its expected lifetime”. This also encompasses the environmental and resources footprint dimensions.

Science policies, practices and skills become the norm across the ERA and that the EOSC federation is enlarged through connecting existing research infrastructures in Europe and providing additional value added services based on user needs, also with the view of enabling the European contribution to a web of FAIR data and services.

Finally, the further evolution of the Destination Earth flagship initiative as a digital model of the Earth on a global scale is also supported, with a strong AI component of the New Digital Twins.

The Research Infrastructures work programme is structured around the following four destinations:

INFRADEV - Consolidation and evolution of the European Research Infrastructure landscape, to develop an integrated European ecosystem of research infrastructures, including single-sited facilities, distributed facilities and networks of facilities providing joint services.

INFRAEOSC - Enabling an operational, open and FAIR EOSC ecosystem, to contribute to a web of FAIR (Findable, Accessible, Interoperable, Reusable) research data and provide a trusted and secure federated system of research data and services (EOSC Federation) for researchers in the EU and Associated Countries to store, share, process and reuse within and across disciplines and borders FAIR research outputs and tools for research, innovation and educational purposes.

INFRASERV - Research infrastructures services to support health research, accelerate the green transition and the digital transformation, and advance frontier knowledge the access to RIs, to support transnational access to state-of-the-art facilities for researchers, relevant for a large research domain or in support of societal challenge and EU priorities.

INFRATECH - Next generation of scientific instrumentation, tools, methods, and advanced digital solutions of research infrastructures and foster innovation and co-creation with industry, to support research infrastructure needs for technology development to maintain and upgrade their services and to create new ones, and to support the Destination Earth initiative.

Calls

Call - Research Infrastructures 2025

HORIZON-INFRA-2025-01

Overview of this call²

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ³	Indicative number of projects expected to be funded
		2025		
Opening: 06 May 2025 Deadline(s): 18 Sep 2025				
Destination INFRADEV - Consolidation and evolution of the European Research Infrastructure landscape (2025)				
HORIZON-INFRA-2025-01-DEV-01: Training and up-skilling of research infrastructures technical staff	CSA	10.00	1.00 to 1.50	8
HORIZON-INFRA-2025-01-DEV-02: Early phase implementation of ESFRI Projects that entered the ESFRI Roadmap in 2021	CSA	16.50	1.00 to 1.50	11
HORIZON-INFRA-2025-01-DEV-03: Consolidation of the Research Infrastructure landscape – Individual support for evolution, long term sustainability and emerging needs of pan-European research infrastructures	RIA	30.00	3.00 to 4.00	8
HORIZON-INFRA-2025-01-DEV-04: Support	CSA	3.00	1.50 to 3.00	1

² The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.

The Director-General responsible may delay the deadline(s) by up to two months.

All deadlines are at 17.00.00 Brussels local time.

The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

³ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

DRAFT

Destinations

Destination INFRADEV - Consolidation and evolution of the European Research Infrastructure landscape (2025)

The objective of this destination is to consolidate and evolve the European research infrastructure landscape, considering notably the development of pan-European research infrastructures prioritised by ESFRI and the ERICs, and underpinning an effective and agile European Research Area. It supports actions to develop an integrated European ecosystem of research infrastructures, including single-sited facilities, distributed facilities and networks of facilities providing joint services.

The expected impact of the EU intervention on the activities supported under this destination notably includes:

- Further consolidation, evolution and optimisation of the European research infrastructure landscape, with the objective to enhance its capacity and capability to support the continuum of research and innovation needs.
- Exploring ways forward towards improved sustainability of the research infrastructure ecosystem and synergies amongst research infrastructure funding sources, considering that funding an increasing number and size of pan-European research infrastructures has a significant impact on research budgets.
- Support for human resources and skills development for an optimal functioning of research infrastructures, through continuous professional training and upskilling of staff in charge of research infrastructures, considering that highly skilled personnel play a vital role in constructing, evolving and operating research infrastructures and serving users; and thus, research infrastructures must be able to attract, up-skill, and keep specialised staff.

Proposals are invited against the following topic(s):

HORIZON-INFRA-2025-01-DEV-01: Training and up-skilling of research infrastructures technical staff

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 1.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: To ensure a balanced portfolio covering a wide range of domains, grants will be awarded to applications not only in order of ranking but at least also to those proposals that are the highest ranked within each domain, provided that the applications attain all thresholds.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁴

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- Enhanced expertise and knowledge of technical staff working in research infrastructures, for an optimal functioning of the infrastructure.
- Enhanced mobility and career opportunities throughout Europe for technical staff, including across research infrastructure domains as well as across sectorial careers.
- ‘One-stop-shop(s)’ of training services dedicated to technical staff that meet the needs of different domains.

Scope: In research infrastructures there is the need for staff with an extraordinary blend of scientific, technical and managerial expertise. Considering that highly skilled personnel play a vital role in constructing, operating and implementing research infrastructures and serving users, research infrastructures must be able to attract, up-skill, and valorise specialised staff to exploit their full potential.

⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

This action will support structuring the offer of training activities dedicated to enhancing skills and career profiles of technical staff working in research infrastructures, as ‘one-stop shop(s)’. This would cover activities such as the development of new training programmes addressed to cover specific needs of research infrastructures, training programmes that promote mobility and career opportunities throughout Europe (for example through staff exchange) or that create training opportunities (for example through summer schools or workshops). Programmes may address the improvement of the skills of different professionals working in a single research infrastructure or in a single domain, and may also enhance horizontal key professionals across research infrastructure domains, covering identified common needs such as those related to digital aspects, research data management, Artificial Intelligence (AI) or enhanced remote access. The activities should include the promotion of existing good practices, as well as dissemination and exploitation of successful experiences to a set of relevant stakeholders.

Individual proposals should focus on one specific domain⁵ (or sub-domain for the largest ones) as defined by ESFRI but should allocate efforts to contribute to gathering programmes under an overarching training service or entry point across domains to facilitate correlation between training supply and demand and to harmonise and optimise the training services offered. This requires dedicated activities for collaboration with other projects under this topic and, where appropriate, common entry portal or cross-references among portals. Proposals should explicitly state which domain (and sub-domain, where applicable) they are addressing.

To ensure consolidation and evolution of the European research infrastructure landscape, considering notably the development of pan-European research infrastructures prioritised by ESFRI and the ERICs, proposals should include at least one ESFRI Landmark⁶ or European Research Infrastructure Consortium (ERIC)⁷ as beneficiary. In case of a distributed⁸ ERIC, as an alternative to the ERIC participating as a beneficiary, a legal entity that is hosting ERIC facilities, resources or related services may participate as a beneficiary. A declaration signed by the legal representative of the ERIC should confirm that the ERIC is supporting this participation, explain the relevance for the ERIC and describe any further cooperation with the ERIC.

Considering past or ongoing actions identifying training needs is encouraged as well as exploring collaboration with relevant training projects e.g. Marie Skłodowska-Curie Actions with a research infrastructure dimension. Projects may also build on the past activities and experience gained in projects such as [RItrainPlus](#) (Research Infrastructure Training Plus).

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) Support Services Directorate in their research infrastructure portfolio. The JRC offers

⁵ ESFRI domains: 1. Data, Computing and Digital Research Infrastructures; 2. Energy; 3. Environment; 4. Health & Food; 5. Physical Sciences and Engineering; 6. Social Sciences & Humanities. See ESFRI Landscape Analysis 2024 <https://landscape2024.esfri.eu/>.

⁶ See lists of ESFRI 'Landmarks' in the 2021 ESFRI Roadmap on <https://roadmap2021.esfri.eu/>

⁷ [European Research Infrastructure Consortium \(ERIC\) | European Commission \(europa.eu\)](#)

⁸ The term ‘distributed’ research infrastructure typically refers to one or a few central hubs and several interlinked (national or institutional) nodes where many components of the research infrastructure may not be part of the same legal entity, the ERIC.

its experience in assessing, setting the strategy, maintaining, operating and providing access to external researchers to its research infrastructures in various fields of science. The JRC runs a specific programme that opens its research infrastructure for access to external users for the purposes of training and capacity building, where researchers are trained on the capabilities and use of our experimental equipment. In this regard, the JRC will consider collaborating with any successful proposal.

HORIZON-INFRA-2025-01-DEV-02: Early phase implementation of ESFRI Projects that entered the ESFRI Roadmap in 2021

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 1.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 16.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced coverage of the targeted ESFRI Projects, grants will be awarded to applications not only in order of ranking but at least also to those proposals that are the highest ranked for each targeted ESFRI Project, provided that the applications attain all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the</p>

	Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁹
--	---

Expected Outcome: Project results are expected to contribute to several of the following expected outcomes:

- Faster and larger implementation of the ESFRI Projects that entered the ESFRI Roadmap in 2021;
- enhanced ERA excellence and attractiveness through the availability of additional capacities from the targeted ESFRI Projects;
- solid Member States/Associated Country engagement in pan-European research infrastructures, leading to their full implementation;
- long-term perspective for investments in research infrastructures;
- synergies and complementarities between new and existing research infrastructures.

Scope: This topic targets the research infrastructure projects that entered the ESFRI Roadmap in 2021¹⁰, due to their scientific excellence and organisational maturity as well as to their strategic importance for the European Research Area and the structuring of the European research infrastructure ecosystem. Proposals must explicitly state which ESFRI Project they target.

Although these ESFRI Projects have received EU funding for their preparatory phase and initial commitment from Member States/Associated Countries, the early stages of the research infrastructure life cycle are particularly challenging. Past monitoring exercises on ESFRI infrastructures highlighted recurrent bottlenecks hampering their full implementation and start of operation phase. Building on such experiences, proposals are expected to identify and address the most critical issues that could prevent or delay the entering of these ESFRI Projects into the implementation phase.

Support can be provided for activities, such as enlargement of the membership; establishment of the governance structure and legal entity; securing the funding; finalisation of the distributed architecture; development of ICT and data management solutions (including data management according to the FAIR principles and possible open access to data); development of access policies and users' strategies; consolidation of the international dimension; consolidation of the service offer; assessing possible expansion to new user communities/new needs; or addressing staff and procurement related issues. Proposals should focus on the activities addressing the identified bottlenecks.

⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹⁰ ESFRI Projects eligible for support under this topic are: EBRAINS, SLICES, SoBigData++, MARINER-I, EIRENE RI, ET, EuPRAXIA, GGP, GUIDE, OPERAS, RESILIENCE.

Proposals should involve all stakeholders necessary to move the project forward and ensure financial commitments (including national/regional ministries/governments, research councils or funding agencies).

Proposals should explain any synergies and complementarities with previous or current EU grants.

HORIZON-INFRA-2025-01-DEV-03: Consolidation of the Research Infrastructure landscape – Individual support for evolution, long term sustainability and emerging needs of pan-European research infrastructures

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>Due to the scope of this topic, proposals must include at least one of the ESFRI Landmarks¹¹ or European Research Infrastructures Consortia (ERICs)¹² as beneficiary. Such research infrastructure(s), and the beneficiaries that own/operate them, must be explicitly identified in the proposal. For distributed ERIC the ERIC must be the beneficiary.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>The funding rate is 80% of the eligible costs.</p>

Expected Outcome: Project results are expected to contribute to several of the following expected outcomes:

- better structured and strengthened European Research Infrastructure (RI) landscape;

¹¹ See the list of ESFRI 'Landmarks' in the 2021 ESFRI Roadmap on <https://roadmap2021.esfri.eu/>
¹² [European Research Infrastructure Consortium \(ERIC\) | European Commission \(europa.eu\)](https://roadmap2021.esfri.eu/)

- new services available to a wider user community, including participants in other parts of Horizon Europe, allowing to better tackle scientific and societal challenges;
- increased capacity to address EU policy priorities and/or socio-economic challenges;
- reinforced global competitiveness of the European Research Area;
- reduction of environmental (including climate-related) impacts as well as optimisation of resource and energy consumption integrated through the full life cycle of research infrastructures;
- increased long-term sustainability of European research infrastructures.

Scope: This topic targets the consolidation of the EU research infrastructures landscape through the support, together with the countries, that are members of the research infrastructures, to the strengthening, long-term sustainability, reorientation or evolution of ESFRI Landmarks or European Research Infrastructure Consortia (ERICs).

Proposed action should justify the specific objectives and focus on activities that are critical for the sustainability and optimised use of the ESFRI Landmarks or ERICs, such as activities aiming at several of the following objectives:

- enlargement of the membership or broadening of the base of participating countries;
- reinforcing international cooperation;
- revision of business/funding plan;
- development of managerial and technical skills for RI staff;
- structuring and strengthening of national nodes;
- extension of remote and/or virtual access;
- management of research data according to the FAIR principles;
- reorientation or evolution of the RI scope;
- addressing critical aspects raised following an assessment or monitoring exercise, e.g. in the context of ESFRI activities;
- Development, update and or implementation of impact assessment of the RI.

In case of reorientation or evolution of the research infrastructure scope, activities should fill gaps in the research infrastructures landscape¹³, enabling the research infrastructure to address

¹³ Although the action aims at individual support to a pan-European research infrastructure, applicants should consider the ESFRI Landscape Analysis and liaise during the action with other relevant ESFRI/ERICs to ensure complementarity.

new research or societal challenges and/or serve new user communities, increasing and improving service capacity and/or integrating new resources/facilities.

Due attention must be given to related EU initiatives and priorities and, when relevant, to complementarity and relevance to activities in other parts of Horizon Europe. Proposals should explain any synergies with previous or current EU grants.

Given the funding rate, proposals should ensure a minimum adequate backing by the beneficiaries, who should provide the remaining share for the activities covered by the Grant Agreement and foster the sustainability of the ESFRI Landmark or ERIC.

Specific attention should be given, where relevant, to the greening of technologies and methodologies used by the research infrastructure, to the interaction with industry/SMEs, to the fostering of the innovation potential of the infrastructures, and to their integration into local, regional and global innovation ecosystems.

HORIZON-INFRA-2025-01-DEV-04: Support to the European Strategy Forum on Research Infrastructures

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.50 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: The granting authority can fund a maximum of one project.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the

	Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁴ .
--	--

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- enhanced efficiency, impact and visibility of ESFRI strategy and actions;
- better structured and strengthened European research infrastructure ecosystem;
- reinforced global competitiveness of the European Research Area;
- coordination and alignment of EU and national priorities for research infrastructures;
- impact assessment of ESFRI.

Scope: The European Strategy Forum on Research Infrastructures (ESFRI) brings together policy makers, funding bodies, and the scientific community to identify joint investment priorities for pan-European research infrastructures as well as to foster their implementation, sustainability and impact. A comprehensive and efficient support structure is essential for the effective execution of ESFRI's tasks and activities.

In this respect, the project should provide administrative support to the ESFRI Chair and the ESFRI Executive Board, and in particular, it should support ESFRI, the ESFRI working groups and other ESFRI bodies in carrying out all of the following activities:

- development and publishing of the ESFRI Roadmap and Landscape Analysis;
- effective evaluation of new ESFRI Roadmap applications and ESFRI project monitoring after 2026, using also external expertise;
- strengthening ESFRI's analytical capacity, including through the use of external expertise in support of ESFRI policy and the ESFRI Roadmap processes;
- effective evaluation and monitoring of research infrastructures on the ESFRI Roadmap through appropriate ICT and analytical tools, using also external expertise;
- development and implementation of the ESFRI communication and outreach strategy, including organisation of ESFRI-led conferences and outreach events;
- fostering cooperation, exchange of experiences and good practices between the research infrastructures, their managers and stakeholders, as well as the funding bodies, including managing authorities of Cohesion policy programmes and policy makers;

¹⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- ensuring cooperation of ESFRI with ERA related groups and initiatives, with the EOSC initiative as well as with any other relevant initiatives, bodies and stakeholders at European or international level, including via the ESFRI Stakeholder Forum;
- calling on third party/ies to carry out an impact assessment of ESFRI taking account of suitable indicators proposed by ESFRI.

The project should organise its workplan in a sufficiently flexible way so as to be able to adapt to changing support needs of ESFRI. A mechanism with ESFRI should be foreseen to ensure optimal adaptation to ESFRI's needs over the course of the project.

All software developed under this destination should be open source, licensed under a CC0 public domain dedication or under an open source licence as recommended by the Free Software Foundation¹⁵ and the Open Source Initiative¹⁶.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) Support Services Directorate in their research infrastructure portfolio. The JRC offers its experience in assessing, setting the strategy, maintaining, operating and providing access to external researchers to its research infrastructures in various fields of science. The JRC is an ESFRI stakeholder and collaborates with several ESFRI/ERIC consortia as an associated partner. In this regard, the JRC will consider collaborating with any successful proposal.

HORIZON-INFRA-2025-01-DEV-05: Preparatory actions exploring future frameworks for research infrastructures investment plans and funding streams, for integrated and sustained scheme for access and for joint technology development.

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 1.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 4.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.
<i>Procedure</i>	The procedure is described in General Annex F. The following

¹⁵ <https://www.gnu.org/licenses/license-list#SoftwareLicenses>

¹⁶ <https://opensource.org/licenses>

	exceptions apply: To ensure a balanced portfolio covering the different areas, grants will be awarded to applications not only in order of ranking but at least also to those proposals that are the highest ranked within each area, provided that the applications attain all thresholds.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁷ .

Expected Outcome: For all areas: research infrastructures, their stakeholders and funders have more robust knowledge to develop strategies, coordinate and align future actions in support of an effective ecosystem of cutting-edge European research infrastructures. Project results are expected to contribute to all of the following expected outcomes for one of the areas:

Area 1: Strengthening research infrastructures investment plans and diversifying funding streams

- Research infrastructure managers benefit from an overview of funding sources at national, regional and EU level.
- Research infrastructure managers and funders are better prepared to develop synergies among complementary funding instruments that fit their specific needs and objectives.
- Funders have a better picture of the financial impact of the priorities and strategies around research infrastructures, covering both day-to-day operations and long-term investments.

Area 2: Preparatory action to explore a more integrated and sustainable scheme for access to research infrastructures

- Proposal for a new EU access scheme addressed to Research Infrastructure stakeholders (research infrastructures funders, research infrastructures managers, research infrastructures user communities), ensuring effective, flexible and seamless access to world-class scientific services and resources in all science and technology fields, accommodating the diverse nature of research infrastructures and their evolving needs, and overcoming the and disruptive effects of an approach based on short-term projects.

¹⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Analysis of how research infrastructures user communities, including from Widening countries, will benefit from a new EU access scheme that enable wider, simplified and more efficient access so as to boost breakthrough and leading-edge research.
- Better understanding by research infrastructure stakeholders of the governance options, funding and implementation aspects of a future access scheme.

Area 3: Framework for joint research infrastructure technology developments

- Research infrastructures benefit from a more stable framework for joint technology developments avoiding duplication, promoting pooling of resources and appropriate support mechanism.
- Research infrastructure innovation ecosystems are further developed, and their overlaps are identified. They underpin the technology developments needed by research infrastructures including the implementation of research infrastructure technology roadmaps.
- A virtuous circle for early involvement of industry, including SMEs, and development or update of joint research infrastructure technology roadmaps is created.
- Mechanisms to ensure the openness of research infrastructure technology innovation ecosystems, which must be able to integrate new EU players.

Scope: Proposals should address only one of the following areas and should explicitly state which area they address:

Area 1: Strengthening research infrastructures investment plans and diversifying funding streams

The European Strategy Forum on Research Infrastructures (ESFRI), through successive roadmaps, has identified European priorities to equip researchers and innovators in Europe with infrastructures for groundbreaking research in all science and technology fields, from fundamental research to technological developments, to addressing pressing challenges of our society.

EU funding has been instrumental with recurrent support to the different phases of the research infrastructure life cycle, from concept and design to preparation and implementation, as well as in integrating and interconnecting new research infrastructure capacities in the European landscape and opening for access to them, overcoming the limits of national research programmes. When appropriate, pan-European research infrastructures have also benefitted from complementary EU funding, such as structural and investments funds or the Recovery and Resilience Facility funds.

However, funding an increasing number and size of pan-European research infrastructures weighs on national research budgets, raising the question of their long-term sustainability and of EU programmes' contribution to the various stages of their life cycle. At the same time, the

Pact for R&I in Europe¹⁸ calls for more concerted investments and further synergies between Union, national and regional funding programmes. The Pact also calls for employing a broader range of funding sources for world-leading research infrastructures and exploring novel ways of funding transnational and virtual access.

Yet, recent ESFRI surveys show the difficulty to capture exhaustive information on the funding streams and level of funding. In many countries, the funding landscape is very complex with multiple funding instruments not always tracking research infrastructures along the final beneficiaries. Similarly, details of non-research EU funding benefitting research infrastructures are not always clear. From the research infrastructures' perspectives, many distributed research infrastructures lack long-term planning and do not have an overview of national funding sources nor expenses of the nodes, including access costs. This lack of visibility is hampering strategic discussions on investments plans and on broader access to research infrastructures.

Taking stock of relevant information sources such as the ESFRI work on funding¹⁹, guides for synergies²⁰, documented examples from research infrastructures, and funders or financial organisms such as the EIB, the action should cover the following aspects:

- Mapping of main funding sources used for the preparation, construction and operation of ESFRI Projects and Landmarks, ERICs and other world-class European research infrastructures.
- Identification of established or potential synergies across funding sources and different financial instruments (including loans), at national/regional and EU level such as EIB funding instruments, structural and investment funds, Recovery and Resilience Facility funds, and funds under the Neighbourhood, Development and International Cooperation Instrument.
- Better understanding of the specific costs and challenges in financing different phases of the research infrastructures life cycle such as construction, operation and necessary upgrades to address greening and digitalisation challenges.
- Case studies of distributed research infrastructures on different approaches in identifying the nature and level of costs and best practices for long-term planning.

Proposals should foresee possible cooperation with projects selected under Area 2 with regards to funding models for access.

Area 2: Preparatory action to explore a more integrated and sustainable scheme for access to research infrastructures

¹⁸ [Council Recommendation \(EU\) 2021/2122 of 26 November 2021 on a Pact for Research and Innovation in Europe](#)

¹⁹ ESFRI Report: Funding of Research Infrastructures <https://www.esfri.eu/esfri-report-funding-research-infrastructures>.

²⁰ E.g. COMMISSION NOTICE Synergies between Horizon Europe and ERDF programmes 2022/C 421/03 [https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52022XC1104\(02\)](https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52022XC1104(02))

The support under Horizon Europe and past EU Framework Programmes for transnational and virtual access to research infrastructures has opened up world-class services and resources across Europe to research communities for their scientific activities, in all science and technology fields. It has helped the structuring of research infrastructures and their communities in organised networks, promoting single entry-points for access to facilities and resources including digital ones, and expanding to new pan-European research infrastructures.

Recent Horizon Europe support promoted further integration to better address users' needs, either around R&I areas to address societal challenges or around large scientific domains, increasing awareness in broader user communities and creating further opportunities for cross-domain R&I. However, the complexity of setting up appropriate project consortia and new access schemes coupled with the short duration projects necessitates a more integrated and sustainable approach.

The action will identify novel approaches and operational steps towards a longer-term, cross-domain integrated access scheme, promoting the vision of a 'one-stop-shop' for access to research infrastructures, their services and resources. It will build on the experience of past and ongoing EU supported access projects (notably under Horizon 2020 INFRAIA and Horizon Europe INFRASERV calls), on best practices from national access schemes, considering position papers from research infrastructures and scientific communities, and related ESFRI work.

Funding bodies, research infrastructure managers and user communities, including from Widening countries, should be involved in the design and governance of the proposed new EU access scheme, building up trust and creating opportunity to ensure a smooth implementation.

The proposal should be representative of all large scientific domains. It should involve EU research infrastructures in different fields, including preferably at least one ESFRI infrastructure²¹ and/or ERIC²² in each of the large ESFRI scientific domains as beneficiary. The action should also ensure a role for representatives of national research infrastructure funders (e.g. as a project consultative committee or advisory board) and appropriate consultation of scientific communities and potential users including from industry and public authorities.

The action will identify all necessary aspects to be addressed and possible options towards implementation. This should notably include options for:

- Governance of the access scheme, advisory bodies (such as scientific boards and users' representatives);
- Funding models, underpinned by an initial core EU funding complemented by other funding streams (institutional, national);

²¹ See the list of ESFRI 'Landmarks' in the 2021 ESFRI Roadmap: <https://roadmap2021.esfri.eu/>
²² [European Research Infrastructure Consortium \(ERIC\) | European Commission \(europa.eu\)](#)

- Access policies including mechanisms ensuring appropriate balance among large domains, scientific fields and techniques best addressing key scientific challenges and the needs of users.

While the access scheme should be driven mainly by the excellence criterion, consideration should be given to incorporating services customised or developed in other projects to address specific EU priorities and societal challenges, as well as offering specific access conditions to targeted user groups, including fast track access e.g. for emergency cases.

The proposed action is expected to deliver on all the following points:

- Concept for a new EU access scheme aiming at wider, simplified, seamless and more efficient access for researchers, including from Widening countries, to the best research infrastructures available.
- Scenarios for governance, co-funding and implementation of the access scheme.
- Promoting breakthrough and leading-edge research enabled by advanced research infrastructure services made available to a wider user community, while ensuring sustainability of the research infrastructures themselves (including by increasing their visibility and attractiveness, and creating incentives for expanding their membership).
- Recommendations on access policies, adopting the principles of the European Charter on Access to Research Infrastructures.
- Good practices on access call conditions, agreements between research infrastructures and selected users, access modalities, selection of users, support to users.
- Proposals for design of possible pilot(s) to be implemented under Horizon Europe calls for improved and harmonised RI services and broader use of RI resources, e.g. in specific domains.
- Outline of a communication plan and key components for a single-entry point portal including opportunities under complementary national or institutional access schemes.

Proposals should foresee possible cooperation with projects selected under Area 1 with regards to funding models for access.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) Support Services Directorate in their research infrastructure portfolio. The JRC offers its experience in assessing, setting the strategy, maintaining, operating and providing access to external researchers to its research infrastructures in various fields of science. The JRC runs a specific programme that opens its research infrastructure for access to external users and has developed a framework for access to its research infrastructures based on the European charter of access to research infrastructures. In this regard, the JRC will consider collaborating with any successful proposal.

Area 3: Framework for joint research infrastructure technology developments

Europe's long term scientific ambitions rely on the availability of world-class research infrastructures. These infrastructures require a continuous effort of optimisation and upgrading. Identifying and developing technology building blocks that can be used by a multitude of research infrastructure communities and across different domains can help increasing the efficiency of public investments in upgrades and optimisations of research infrastructures. Such efficiency gains can be further increased with standardisation and interoperability efforts and the identification of overlaps between different domain-specific ecosystems. Further development efforts rely on functioning innovation ecosystems for research infrastructure technologies, involving infrastructure operators, users, and industry, including SMEs and key other relevant stakeholders. Ensuring the functional capacity of such ecosystems as well as its resilience against disruptions require the creation of a more integrated and long-term planning and implementation of joint technology research.

Research infrastructure technologies are also understood to cover, where applicable, areas such as sample environments, support facilities, and software.

To ensure consolidation and evolution of the European research infrastructure landscape, considering notably the development of pan-European research infrastructures prioritised by ESFRI and the ERICs, proposals should include at least two different research infrastructures as beneficiaries²³ each of them being an ESFRI Landmark²⁴ a European Research Infrastructure Consortium²⁵ (ERIC) or another research infrastructure that is an international European research organisation²⁶. Such research infrastructures, and where applicable the beneficiaries that own/operate them, must be explicitly identified in the proposals. In case of a distributed²⁷ ERIC, as an alternative to the ERIC participating as a beneficiary, a legal entity that is hosting ERIC facilities, resources or related services may participate as a beneficiary. A declaration signed by the legal representative of the ERIC should confirm that the ERIC is supporting this participation, explain the relevance for the ERIC and describe any further cooperation with the ERIC.

To ensure buy-in of the different scientific communities, the action will involve research infrastructures, covering a maximum of ESFRI domains, and, where relevant, user organisations and key industry and SME players. The consortium itself should consist of key research infrastructures that are representative of at least two ESFRI domains. While it is expected that the consortium includes research infrastructures representative of the different ESFRI domains covered, involvement of additional research infrastructures can be shown via engagement letters or other forms of endorsement.

²³ The participation of two nodes of the same ESFRI infrastructure or ERIC does not count as two different research infrastructures.

²⁴ See the list of ESFRI 'Landmarks' in the 2021 ESFRI Roadmap: [https://roadmap2021.esfri.eu/European_Research_Infrastructure_Consortium_\(ERIC\)_|_European_Commission_\(europa.eu\)](https://roadmap2021.esfri.eu/European_Research_Infrastructure_Consortium_(ERIC)_|_European_Commission_(europa.eu))

²⁵ An 'international European research organisation' means an international organisation, the majority of whose members are Member States or associated countries, whose principal objective is to promote scientific and technological cooperation in Europe.

²⁶ The term 'distributed' research infrastructure typically refers to one or a few central hubs and several interlinked (national or institutional) nodes where many components of the research infrastructure may not be part of the same legal entity, the ERIC.

The project should build on previous roadmapping and synergy efforts made by scientific communities and on projects such as the ones funded under Horizon 2020 INFRAINNOV-04-2020.

The project should address all of the following aspects:

- Identification of technology overlaps or building blocks relevant for multiple domains and infrastructure types.
- Identification of further technology roadmapping needs, covering both transversal needs and domain-specific needs.
- Identification of standardisation and interoperability needs.
- Identification of possible training and coordination needs, from technical to management staff.
- Exploration of funding mechanisms, best adapted to the needs of different research infrastructure technology innovation ecosystems.
- Identification of optimal interaction modes between research infrastructures and industry, including SMEs, depending on the research infrastructure technology innovation ecosystem.

Destination INFRAEOSC - Enabling an operational, open and FAIR EOSC ecosystem (2025)

This destination serves the European Open Science Cloud (EOSC) ambition of contributing to a web of FAIR (Findable, Accessible, Interoperable, Reusable) research data and providing a trusted and secure federated system of research data and services (EOSC Federation) for researchers in the EU and Associated Countries to store, share, process and reuse within and across disciplines and borders FAIR research outputs and tools for research, innovation and educational purposes.

The expected impacts of the activities supported under this destination are in line with objectives of the co-programmed European Partnership for EOSC and its Strategic R&I Agenda, in particular:

- Enable the definition of standards, and the development of tools and services, to allow researchers to find, access, reuse and combine results;
- Establish a sustainable and federated infrastructure enabling open sharing of scientific results;
- Ensure that Open Science practices and skills are rewarded and taught, becoming the norm across the European Research Area.

Activities should continue to transform the research landscape in Europe by bringing cohesion and addressing common needs of the research communities. The programme should catalyse a fully operational environment covering the whole research data lifecycle across borders and communities.

To further advance this ambition, the EU must continue investing in dedicated activities and ensure synergies between EOSC-related actions at the EU, national, institutional and community levels.

All software developed under this destination should be open source, licensed under a CC0 public domain dedication or under an open source licence as recommended by the Free Software Foundation²⁸ and the Open Source Initiative²⁹.

All projects financed under this destination are expected to participate in concertation activities in the framework of the EOSC Partnership.

Proposals are invited against the following topic(s):

HORIZON-INFRA-2025-01-EOSC-01: EOSC Nodes with federating capabilities for the EOSC Federation

Call: Research Infrastructures 2025
--

²⁸ <https://www.gnu.org/licenses/license-list#SoftwareLicenses>

²⁹ <https://opensource.org/licenses>

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>Subject to restrictions for the protection of European communication networks.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 7-8 by the end of the project – see General Annex B.
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The following additions to the general award criteria apply: The extent to which the proposed work incorporates the necessary coordination efforts and resources with other relevant projects and the EOSC governance structure in the context of the EOSC Partnership will be taken into account for Impact.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties (FSTP). The support to third parties can only be provided in the form of grants. The maximum amount to be granted to each third party is EUR 60 000.</p> <p>Beneficiaries will be subject to the following additional access rights:</p> <ul style="list-style-type: none"> • Each beneficiary must grant royalty-free access to its results to the EOSC Association for monitoring and developing policies and strategies for the European Open Science Cloud. Each beneficiary must also provide directly to the EOSC Association the information the beneficiary deems necessary for monitoring and developing policies and strategies for the EOSC. • Each beneficiary must grant royalty-free access to its intellectual property rights which are part of the results and are needed for further developing the EOSC to legal entities identified by the granting authority and established in Member States or countries associated to the Horizon Europe Framework Programme. Such

	<p>access rights are limited to non- commercial use.</p> <p>Beneficiaries must deposit the digital research data generated in the action in a trusted repository federated in the EOSC in compliance with EOSC requirements.</p>
--	--

Expected Outcome: Project results are expected to contribute to the following outcomes:

- The EOSC federation will be established as a distributed system of systems, comprising of independently managed EOSC nodes that collaborate to augment their contribution to EOSC users whilst ensuring resilience of the interconnected systems by supporting the common federating capabilities.
- Researchers will benefit from unified support aimed at integrating their research environments with the EOSC federation and this coordinated assistance will streamline the alignment of research practices with the EOSC ecosystem.

Scope: The call aims to further develop the cross-domain EOSC system of systems, building upon the results of the previous INFRAEOSC calls³⁰. The focus is on developing and expanding the EOSC federation through a network of nodes as baseline elements of the federation model. These EOSC nodes will establish a set of essential federating capabilities, compatible with the EOSC EU Node reference architecture, following the EOSC Federation Handbook and EOSC interoperability framework. They should have a clearly described identity and offer unique value to EOSC users, for example representing a specific thematic domain (e.g. data or computing) or geographical area amongst the Horizon Europe participating and associated countries.

To become an EOSC node, the proposals are expected to demonstrate the ability to assess and address the existing gaps regarding the federating capabilities at technical, legal and organisational level. The proposals are expected to indicate adherence to the EOSC governance structure, federation policies and capabilities. They should also address business models, service management procedures, and technical and semantic interoperability. Furthermore, the proposals should propose a credible plan to ensure the sustainability of the proposed solutions beyond the project lifespan, including how to take over or replicate the federating role currently ensured by the EOSC EU Node³¹.

More specifically, the proposals should focus on all of the following aspects:

³⁰ https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/wp-call/2021-2022/wp-3-research-infrastructures_horizon-2021-2022_en.pdf;

https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/wp-call/2023-2024/wp-3-research-infrastructures_horizon-2023-2024_en.pdf

³¹ <https://open-science-cloud.ec.europa.eu/>. Financial support for third-parties (FSTP), that will make value-added data, tools and services ready to be onboarded and available via the node, can be included in the proposals. The FSTP budget will only cover the cost of onboarding.

- Satisfy the minimal node requirements as defined by the EOSC tripartite governance³², and go beyond them by further development and refinement of the harmonized participation model, taking into account the variety of thematic and national dimensions in the EOSC federation. These requirements include: ³³;
 - o Compliance with the requirements on the legal status of the organisation;
 - o Compliance with the requirements aiming at large-scale, quality service provisioning;
 - o Capacity to onboard third-party services
- Capacity to contribute to and/or take-over the EOSC federating capabilities;
- Adoption and integration of the EOSC federation rules and policies, and further refinement and practical adaptation of best practices;
- Support to effectively monitor and report the activities of the services provided.
- Integrate and offer EOSC core federating capabilities pioneered by the EOSC EU Node, such as Authentication, Authorisation and Accounting, Research Catalogues and Knowledge Graph, Application Workflows, Monitoring and Helpdesk
- Contribute to a robust and coordinated strategy for evolving and sustaining the federated governance model for EOSC by fostering effective collaboration and coordination among the other node operators offering federating capabilities. This can be done for example by distributing the work and taking a share in facilitating the identification, selection and integration/enrolment of other organisations interested in becoming responsible for operating an EOSC node and representing various countries, regions and scientific disciplines.
- Enrich the existing guidelines and best practices for the onboarding and enrolment processes.
- Evolve and refine the EOSC federation specifications to drive the evolution across governance, operations, sustainability and technical interoperability.
- Designate and train the EOSC node operators, especially those offering federating capabilities, for high level of responsibilities within the EOSC federation.
- Develop and run community engagement and support programmes around the EOSC nodes and the surrounding ecosystem.

³² https://eosc.eu/wp-content/uploads/2024/05/EOSC-A_GA8_20240527-28_Paper-G_Update_EOSC_Nodes_requirements-DRAFT-v240524.pdf

³³ Financial support for third-parties (FSTP), that will make value-added data, tools and services ready to be onboarded and available via the node, can be included in the proposals. The FSTP budget will only cover the cost of onboarding.

HORIZON-INFRA-2025-01-EOSC-02: FAIR Integration for Enhanced Research Data in the EOSC ecosystem and beyond

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 5.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 16.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The following additions to the general award criteria apply: The extent to which the proposed work incorporates the necessary coordination efforts and resources with other relevant projects and the EOSC governance structure in the context of the EOSC Partnership will be taken into account for Impact.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries will be subject to the following additional access rights: Each beneficiary must grant royalty-free access to its results to the EOSC Association for monitoring and developing policies and strategies for the EOSC. Each beneficiary must also provide directly to the EOSC Association the information the beneficiary deems necessary for monitoring and developing policies and strategies for the EOSC.</p> <p>Beneficiaries must deposit the digital research data generated in the action in a trusted repository federated in the EOSC in compliance with EOSC requirements.</p>

Expected Outcome: Projects are expected to contribute to all of the following expected outcomes:

- improved findability, accessibility, interoperability and re-usability (“FAIRness”) of research data and other digital research outputs;
- wider uptake of and compliance with FAIR data principles and practices by national and European research data and metadata providers, repositories and databases;

- operationalisation of the concept of FAIR digital objects throughout the entire research data lifecycle;
- enhanced and mainstreamed technical specifications for FAIR digital objects to facilitate the creation of digital objects that are FAIR-by-design.

Scope: The scope of this call topic is centred on advancing the interoperability and integration of research data within the European Open Science Cloud (EOSC), in alignment with the broader context of the Common European Data Spaces and cross-sector collaboration. FAIR digital objects provide a conceptual and implementation framework to develop scalable cross-disciplinary capabilities, deal with the increasing data volumes and their inherent complexity, build tools that help to increase trust in data, create mechanisms to efficiently operate in the domain of scientific assertions, and promote data interoperability. Proposals should cover all of the following areas and activities:

- FAIR-by-Design digital objects creation: the development of tools that enable the creation of digital objects adhering to the FAIR (Findable, Accessible, Interoperable, Reusable) principles both from the “source” or as a result of an analysis.
- Automated standardisation and data quality assessment: development and provision of automated tools and procedures for standardisation and data quality assessment. This will ensure that data across different domains adhere to common standards, fostering greater compatibility and enhancing overall data quality.
- Operational data services specification: delivering technical specifications for operational data services that support the transformation of digital objects into FAIR entities. Such services may include the integration of AI-based tools capable of autonomously operating on data repositories, contributing to the automatic establishment of FAIR practices throughout the research ecosystem.
- Interoperability and training to promote the uptake of open standards: the action should make substantial contributions to the development, upkeep and widespread adoption of open standards for metadata, formats, vocabularies, semantics and APIs. Activities should foster compatibility among digital objects across different domains, facilitating seamless data exchange and integration. Training and dissemination activities will facilitate the uptake of these standards, fostering collaboration and compatibility.
- Collaboration and alignment with Common European Data Spaces: harmonisation of EOSC technical specifications with those of other Common European Data Spaces.
- Interoperability demonstration and content integration: demonstrating the tangible outcomes of applying FAIR tools, standards, and specifications will showcase the achieved interoperability and integration, strengthening the case for data sharing and reuse across disciplines and sectors.
- Cross-Sector data utilization: by enhancing content integration from data spaces, industry, and beyond, the reuse of science data in various sectors is to be encouraged.

This will ease access to real-life data from other data spaces, fostering its utilization in research and expanding its impact.

These activities will have to be developed in accordance with standards and guidelines defined or adopted by EOSC, promoting data quality and open access practices. To ensure complementarity of outcomes, proposals are expected to cooperate and align with activities of the EOSC Partnership and to coordinate with relevant initiatives and projects contributing to the development of EOSC, including projects funded by the call topics HORIZON-INFRA-2023-EOSC-01-04 - ‘Next generation services for operational and sustainable EOSC Core Infrastructure’ and HORIZON-INFRA-2024-EOSC-01-05 - ‘Innovative and customizable services for EOSC Exchange’. In addition, cooperation is expected with project(s) funded by the call topic HORIZON-INFRA-2025-01-EOSC-01. Finally, proposals should build on the work delivered by the projects FAIR-IMPACT and FAIRCORE4EOSC, especially in the areas of interoperability across disciplines and sectors, as well as in the mainstreaming of creating FAIR-by-Design digital objects. This topic implements the co-programmed European Partnership for the European Open Science Cloud.

HORIZON-INFRA-2025-01-EOSC-03: Advancing AI-readiness and Machine-Actionability in the EOSC Ecosystem

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 7.50 and 15.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 15.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>Subject to restrictions for the protection of European communication networks.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 4 and achieve TRL up to 6 by the end of the project – see General Annex B.
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The following additions to the general award criteria apply: The extent</p>

	to which the proposed work incorporates the necessary coordination efforts and resources with other relevant projects and the EOSC governance structure in the context of the EOSC Partnership will be taken into account for Impact.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries will be subject to the following additional access rights:</p> <ul style="list-style-type: none"> • Each beneficiary must grant royalty-free access to its results to the EOSC Association for monitoring and developing policies and strategies for the European Open Science Cloud. Each beneficiary must also provide directly to the EOSC Association the information the beneficiary deems necessary for monitoring and developing policies and strategies for the European Open Science Cloud. • Each beneficiary must grant royalty-free access to its intellectual property rights which are part of the results and are needed for further developing the European Open Science Cloud to legal entities identified by the granting authority and established in Member States or countries associated to the Horizon Europe Framework Programme. Such access rights are limited to non-commercial use. <p>Beneficiaries must deposit the digital research data generated in the action in a trusted repository federated in the European Open Science Cloud (EOSC) in compliance with EOSC requirements.</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).³⁴.</p> <p>Grants awarded under this topic will be linked through collaboration agreements to the grants from the following action:</p> <p>HORIZON-INFRA-2025-01-EOSC-05: Using Generative AI (GenAI4EU) for Scientific Research via EOSC.</p>

³⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: Project results are expected to contribute to the following outcomes:

- EOSC will be advancing AI-readiness and Machine-Actionability (MA) in the ecosystem by offering AI-ready federated infrastructure and easy-to-use platform services for EOSC, in order to respond to one of the main challenges of research infrastructures for AI in science, namely the lack of interoperability between AI/ML solutions.
- EOSC will focus on integrating machine-actionable repositories within the ecosystem and demonstrating their reliability and effectiveness by collaborating with repository owners and service providers to implement MA tools and protocols, ensuring seamless integration with the EOSC EU Node.

Scope: Today, the sustainable FAIRification of data can be a bottleneck towards the goal of a European web of FAIR data and services. The use of AI/ML can significantly help in the process of FAIRification, data curation and data quality assurance, close to the source of the data. EOSC shall promote actions that give incentives to further advance AI-readiness and Machine-Actionability in the EOSC federation for FAIRification and to support their application.

European researchers need access to compute and repository services to develop, train and validate AI/ML models, in line with the GenAI4EU initiative and other key initiatives, like the Apply AI strategy, based on AI-ready research data from research infrastructures and third-party repositories. The proposed infrastructures should complement the EOSC EU Node capacity and be able to scale to a large number of users within transnational access to high-value datasets from national and European Research Infrastructure and e-Infrastructure ecosystems.

AI-based assistance tools shall be customised and trained for the discovery and composition of open science resources into custom workflows allowing researchers to discover and interact with open science infrastructures, combining relevant data, software and application assets.

Open Data and Open Research Software are essential for reliable, trustworthy, and transparent AI/ML. They ensure that datasets and algorithms are well documented, accessible, and reproducible, enabling others to validate and understand AI/ML algorithms. This transparency fosters trust, supports ethical standards, and ensures compliance with regulations, particularly important in the field of AI/ML.

The proposals should focus on all following aspects:

- Develop and prototype tools to drive machine-actionability in repositories, data, and services, establishing a network of trusted repositories linked to the EOSC EU Node;
 - formulate open protocols and policies to facilitate effortless data access, transfer, processing, and provenance updates within EOSC's repository and service network;

- o deliver AI-based capabilities to make interoperable AI/ML solutions and facilitate the setup of custom workflows for research data processing;
 - o offer tools/services for automatic quality measures of inputs and outputs of the AI/ML models.
- Provide federated infrastructure services for serving AI models integrating horizontal and thematic EOSC nodes:
 - o ensure capacities for AI model retraining and inference;
 - o take into account the whole research data life cycle, including raw data retention before AI modelling.
- Provide access to an easy-to-use technology platform offering reference implementations and recipes to quickly get started working with AI/ML with limited engineering overhead:
 - o promote and apply state-of-the-art AI/ML operational best practices;
 - o validate reference implementations and share commonly used recipes within EOSC.
- Establish and/or provide access to existing AI/ML model repositories and services to serve models for retraining of generic models for specific needs for future predictions and reproducibility:
 - o create AI/ML model repository and enhance FAIRness of existing AI/ML models;
 - o offer services for utilisation of these models, including fine-tuning and inference, thus providing the foundational building blocks for the development of AI applications in EOSC.
- Establish an EOSC AI/ML competency centre for the pooling of expertise and coordinated support on AI/ML use of data, compute infrastructure and AI/ML models for the upskilling and technical support of EOSC users and research operators, as a strategic asset that will enable a new paradigm for science production.

The proposers should take into account and leverage on the results of relevant projects in the field, including EOSC Data Commons³⁵, and the other initiatives and projects contributing to the development of EOSC, especially in the area of machine-actionability and data FAIRification.

This topic implements the co-programmed European Partnership for the European Open Science Cloud.

³⁵ Insert a reference

HORIZON-INFRA-2025-01-EOSC-04: Data stewards, skills and training for Open Science and FAIR practices

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 5.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 8.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The following additions to the general award criteria apply: The extent to which the proposed work incorporates the necessary coordination efforts and resources with other relevant projects and the EOSC governance structure in the context of the EOSC Partnership will be taken into account for Impact.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries will be subject to the following additional access rights: Each beneficiary must grant royalty-free access to its results to the EOSC Association for monitoring and developing policies and strategies for the EOSC. Each beneficiary must also provide directly to the EOSC Association the information the beneficiary deems necessary for monitoring and developing policies and strategies for the EOSC.</p> <p>Beneficiaries must deposit the digital research data generated in the action in a trusted repository federated in the EOSC in compliance with EOSC requirements.</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. The maximum amount to be granted to each third party is EUR 60 000.</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the</p>

	Research and Training Programme of the European Atomic Energy Community (2021-2025). ³⁶ .
--	--

Expected Outcome: Projects are expected to contribute to all of the following expected outcomes:

- Definition of consistent core curricula for data stewards throughout Europe, fostering the adoption of Open Science and FAIR principles.
- Enhanced data steward skills, enhancing their ability to manage and interpret complex data.
- Advancement of Open Science education throughout all research career stages. Creation and standardisation of open science curricula tailored to researchers at all career stages, promoting consistency and collaboration in Open Science practices.
- Expansion and strengthening of existing competence networks, broadening their scope across countries and disciplines and improving their readiness to support the uptake of Open Science and of EOSC. Development of a sustainable coordination network model to support synergies and continued growth.
- Mainstreaming transparent, aligned, and interoperable Open Science practices and promoting efficiency and trustworthiness in the management of FAIR digital objects.

Scope: The uptake of Open Science practices and of the European Open Science Cloud (EOSC) requires dedicated, professional profiles for data curation and data management, as well as equipping researchers with adequate skills and supporting them for the sharing and re-use of FAIR research digital objects. However, at present, data stewards and related profiles lack well-defined career paths, and data sharing and other open science practices are not fully mainstreamed within the research community and are often not recognised in research assessment practices.

The objective of this topic is to foster a stronger culture of Open Science and to address gaps related to the professionalisation of data stewards and to the acquisition and recognition of open science and data management skills at all career levels. This requires the identification of consistent core curricula for data stewards, together with the further development and coordination of competence centres at the European level.

Proposals are expected to cover the following activities:

- Coordinating European-level actions to make data steward curricula management consistent and to propose mechanisms to monitor their suitability and possible evolution.

³⁶ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Enhancing data steward and researcher curricula with Open Science and FAIR practices, ensuring adaptability at the different contexts, levels and scientific domains of applicability.
- Addressing diverse data steward levels, including support staff and researchers.
- Collaborating with existing competence centres to foster Open Science and FAIR networks.
- Leveraging national networks and related institutional initiatives for European-level coordination.
- Launching outreach programs targeting early-career researchers and less-structured communities.
- Offering support to countries and institutions that are underrepresented and bolstering national competence centre networks.

Proposals are expected to build on and align with the European Competence Framework for Researchers (ResearchComp)³⁷ and with the revised Charter for Researchers³⁸, which underline the importance of Open Science competences and practices in research careers. Proposals should also seek for synergies with the activities of the Coalition for Advancing Research Assessment (CoARA) in order to reach a better recognition of open, collaborative practices in research assessment.

To ensure complementarity of outcomes, proposals are expected to cooperate and align with activities of the EOSC Partnership and to coordinate with relevant initiatives and projects contributing to the development of EOSC. In particular, proposals should take account of the results of the Skills4EOSC and FAIR-IMPACT projects and interact with related initiatives aimed at developing competence centres and at improving FAIR data practices in different contexts, like in research infrastructures, research performing organisation and higher education institutions. In particular, cooperation is expected with project(s) funded by call topic HORIZON-INFRA-2025-01-EOSC-02. Proposals are expected to propose adequate measures and tailor its support to different levels and contexts of data stewardship.

Proposals are expected to establish interactions with the operators of the EOSC Federation, in order to ensure alignment with the policies and practices of the EOSC Federation, notably on the area of data interoperability standards, persistent identifiers and others to identify useful tools and resources for the broad EOSC community. This topic implements the co-programmed European Partnership for the European Open Science Cloud.

HORIZON-INFRA-2025-01-EOSC-05: Using Generative AI (GenAI4EU) for Scientific Research via EOSC

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 7.50 and 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 37.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>Subject to restrictions for the protection of European communication networks.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 4 and achieve TRL up to 6 by the end of the project – see General Annex B.
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The following additions to the general award criteria apply: The extent to which the proposed work incorporates the necessary coordination efforts and resources with other relevant projects and the EOSC governance structure in the context of the EOSC Partnership will be taken into account for Impact.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries will be subject to the following additional access rights:</p> <ul style="list-style-type: none"> • Each beneficiary must grant royalty-free access to its results to the EOSC Association for monitoring and developing policies and strategies for the European Open Science Cloud. Each beneficiary must also provide directly to the EOSC Association the information the beneficiary deems necessary for monitoring and developing policies and strategies for the European Open Science Cloud. • Each beneficiary must grant royalty-free access to its intellectual

	<p>property rights which are part of the results and are needed for further developing the European Open Science Cloud to legal entities identified by the granting authority and established in Member States or countries associated to the Horizon Europe Framework Programme. Such access rights are limited to non-commercial use.</p> <p>Beneficiaries must deposit the digital research data generated in the action in a trusted repository federated in the European Open Science Cloud (EOSC) in compliance with EOSC requirements.</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025)³⁹.</p> <p>Grants awarded under this topic will be linked through collaboration agreements to the grants from following action:</p> <p>HORIZON-INFRA-2025-01-EOSC-03: Advancing AI-readiness and Machine-Actionability in the EOSC Ecosystem.</p>
--	--

Expected Outcome: Project results are expected to contribute to the following outcomes:

- EOSC will make available the high-quality machine-readable scientific datasets to be consumed by machine-driven Generative AI applications at the service of science in line with the GenAI4EU⁴⁰ initiative and other key EU initiatives, like the Apply AI strategy.
- EOSC will facilitate the pooling and sharing of high-value data sets originated from EOSC and other data spaces identified as priorities (including, but not limited to, public sector, health, climate, environmental, manufacturing, agriculture, energy, financial and mobility data). The large-scale actions supported by EOSC will include the creation of common data platforms enabling secure and compliant sharing and reuse of sensitive, confidential, proprietary and personal data, as well as large-scale experimentation based on Generative AI, in line with the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy.

³⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁴⁰ This call falls under the ‘GenAI4EU’ initiative as in the Communication from the Commission to the European Parliament, the Council, the European Economic And Social Committee and the Committee of the Regions on boosting startups and innovation in trustworthy artificial intelligence ((COM(2024) 28 final of 24.1.2024).

Scope: The scope of this call is to demonstrate and foster the use of Generative AI for Scientific Research, in line with the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy, throughout the research data lifecycle supported by EOSC. Generative AI can be used for activities such as writing, data generation and analysis, reporting and many others, for improving productivity. This enables lifting science beyond the human scale by facilitating the deployment and use of smart algorithms, machine learning and AI services onto the Web of FAIR Data. The awareness and readiness of using Generative AI for scientific research must be raised by training activities.

AI-powered natural language interfaces can transform the way researchers interact with open science infrastructures, how they discover and combine relevant data, software and application assets. EOSC should evolve towards offering such capabilities in ways that ensure unbiased and trustworthy responses. This includes adopting FAIR practices, for AI-trained models as well, to address challenges ranging from reproducibility to trustworthiness.

Open Data and Open Research Software are essential for reliable, trustworthy, and transparent GenAI. They ensure that datasets and algorithms are well-documented, accessible, and reproducible, enabling others to validate and understand GenAI algorithms. This transparency fosters trust, supports ethical standards, and ensures compliance with regulations, particularly important in the field of GenAI.

The proposals shall focus on all following aspects:

- Enrich the EOSC federation with Generative AI tools for evaluating research data quality, ensuring trustworthiness across the European network of trusted repositories, accessible by humans, machines, and Generative AI services: formulate protocols and policies to facilitate effortless data access, processing, and provenance updates within EOSC's repository and service network.
- Support European research infrastructures to improve the FAIRness of their data, so that they are ready to be combined with data of infrastructures in scientifically neighbouring domains, in order to provide Generative AI-ready data.
 - o conduct pilots to validate the effectiveness and accuracy of the Generative AI-driven data quality evaluation methods, iteratively improving and refining them based on feedback and real-world use cases and removing the potential biases inherited from the training data.
- Run community engagement and support programmes for implementing Generative AI in scientific workflows via EOSC:
 - o promote a sound training programme to facilitate the uptake and the use of Generative AI as a means to facilitate the FAIRification of data and data curation;
 - o demonstrate how Generative AI can facilitate quality assessment of FAIR data;

- o advance the realization of machine-actionable (MA) research data and services, including AI-based systems;
- o propose protocols and policies to govern automatic data workflows within the network of repositories and services.

The proposals are expected to deliver on one or more of the following:

- Develop, promote and support real-life use cases for Generative AI models in scientific research domains, in line with the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy, such as:
 - o augment datasets in scientific fields that rely on image analysis, such as biology, astronomy, and materials science: by generating synthetic images that closely resemble real data, researchers can expand their datasets, improve model robustness, share anonymized version of sensitive data and generalize better to unseen scenarios;
 - o learn the underlying patterns of complex time-series data, such as sensor readings in environmental monitoring or physiological signals in healthcare: by generating data samples that match the learned distribution, these models can detect anomalies or deviations from normal behaviour;
 - o accelerate materials design and discovery by predicting the properties of new materials without the need for extensive experimental testing: these models can generate novel material structures with desired properties, such as strength, conductivity, or catalytic activity, based on learned relationships between material compositions and properties;
 - o advance drug design and molecular modelling by generating novel molecular structures with desired pharmacological properties: these models can explore vast chemical spaces, predict the interactions between molecules and biological targets, and optimize drug candidates for efficacy and safety;
 - o simulate complex systems and phenomena in various scientific domains, such as physics, chemistry, and ecology: by capturing the underlying dynamics and interactions of the system, these models can generate realistic simulations that mimic observed behaviour or predict future outcomes under different conditions.

The proposers should take into account and leverage on the results of relevant projects in the field, including AI4EOSC⁴¹, iImagine⁴², EOSC Data Commons⁴³, RI-SCALE⁴⁴, and other developments within the scope of the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy.

⁴¹ <https://ai4eosc.eu/>

⁴² <https://www.imagine-ai.eu/>

⁴³ Grant no 101188179 from the call HORIZON-INFRA-2024-TECH-01

⁴⁴ Grant no 101188168 from the call HORIZON-INFRA-2024-TECH-01

This topic implements the co-programmed European Partnership for the European Open Science Cloud.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) research infrastructure in their research infrastructure portfolio for the creation and sharing of high-quality machine-readable scientific datasets to be consumed by machine-driven Generative AI applications. In this regard, the JRC will consider collaborating with any successful proposal.

DRAFT

Destination INFRASERV - Research infrastructures services to support health research, accelerate the green transition and the digital transformation, and advance frontier knowledge (2025)

EU supported transnational access to research infrastructures has radically transformed the availability of state-of-the-art facilities for researchers, reinforcing Europe's strong research performance. Horizon Europe marked a shift towards new types of transnational access grants, awarded to consortia of diverse types of facilities providing access to broad portfolios of installations and scientific services relevant for a large research domain or in support of societal challenge and EU priorities.

Actions under this destination are invited to facilitate a fast-track access for Ukrainian researchers from government controlled territories, through specific outreach activities, support in preparing applications to the access calls, selection priority at equal scientific merit, as well as extended ad-hoc training and duration of visits (beyond 3 months).

The expected impact of the activities supported under this destination notably includes:

- Effective access of European researchers to the best research infrastructure services from national and pan-European research infrastructures (such as ESFRI Projects and Landmarks, ERICs), while ensuring both curiosity-driven and challenge-driven access, considering also that challenge-driven access must notably foster the role of research infrastructures in greening society and improving its resilience to crises.
- Improved research infrastructure services to address evolving scientific and societal challenges, including those related to EU priorities, and to reinforce the excellence, attractiveness and competitive edge of the ERA and its capacity to address future challenges and priorities, considering that this increasingly requires interdisciplinarity and cross-domain collaboration.
- Improved transnational access to new users such as early-stage career researchers, and researchers from other fields or sectors, while making sure that these new activities do not come at the cost of already overbooked transnational access services.
- New discoveries and knowledge breakthroughs enabled by access provision to the best and in some cases unique state-of-the-art RIs.
- A new generation of researchers trained to optimally exploit all the essential and advanced tools for their research.

Proposals are invited against the following topic(s):

HORIZON-INFRA-2025-01-SERV-01: Research infrastructure services to enable R&I addressing main challenges and EU priorities related to the health domain

Call: Research Infrastructures 2025

Horizon Europe - Work Programme 2025
Research Infrastructures

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants are not required to include in their proposal a plan for the exploitation and dissemination of the results as the main objective of these actions is the service provision.</p> <p>As proposals need to give information on the research infrastructures providing access, the page limit of the application is 100 pages.</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>Given the specific nature of this topic, access provision activities must be included in the proposal. Please read carefully the provisions under the section “Specific features for Research Infrastructures” of this work programme part before preparing your application.</p> <p>Considering the Union’s interest to make accessible to its researchers the most advanced research infrastructures, wherever they are in the world, legal entities established in Australia, Brazil, Canada, Chile, India, Japan, Mexico, New Zealand, Republic of Korea, Singapore, Switzerland, and USA, which provide, under the grant, access to their research infrastructures to researchers from Member States and Associated Countries, are exceptionally eligible for funding from the Union under this topic.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The following additions to the general award criteria apply:</p> <p><i>For the 'Excellence' criterion</i>, the additional following aspects will also be taken into account:</p>

	<ul style="list-style-type: none"> • The extent to which the access activities (trans-national and/or virtual access) will offer access to the state-of-the-art infrastructures of European interest in the field, high quality services, and will enable users to conduct excellent research. • The extent to which the project will contribute to facilitating and integrating the access procedures, to improve the services the infrastructures provide and to further develop their on-line services.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio covering the different areas, grants will be awarded to applications not only in order of ranking but at least also to those proposals that are the highest ranked within each area, provided that the applications attain all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs may take form of unit costs for trans-national and virtual access to research infrastructures as defined in the Decision authorising the use of unit costs for the actions involving trans-national and virtual access (see Annex 2a of the Horizon Europe Model Grant Agreement).</p>

Expected Outcome:

For all areas:

- Provision of innovative, customised and efficient research infrastructures services enhancing and increasing society's long-term and consistent problem-solving capacity and evidence-based policy making related to the health domain.

Project results are expected to contribute to all of the following expected outcomes for one of the areas:

Area 1: research infrastructure services to support research and development of medical countermeasures for epidemic response:

- Excellent research and innovation to identify, characterise and mitigate the effects of existing and future emerging pathogens of public health concern.
- Comprehensive catalogue of research infrastructure services relevant to tackle infectious diseases epidemics, updated and available.
- Increased knowledge on, and development of intervention tools against (re)emerging pathogens enabled by relevant research infrastructure services.

- Availability of research data emerging from access provision activities for re-use on common data platforms and registries, according to FAIR principles and compliant with legal provisions under the General Data Protection Regulation (GDPR).
- Challenge driven integration of EU research infrastructures and organisational and structural alignment with the future Pandemic Preparedness Partnership, the EU Reference Laboratories and the EU4Health funded laboratory network [DURABLE](#) (or relevant legacy initiative).
- Providing a long-term sustainability concept for such a research infrastructure network supporting epidemic research.

Area 2: research infrastructure services for improving clinical research in the paediatric area:

- Advancement of paediatric medicines and other therapeutic and diagnostic approaches for this population group to markets and towards clinical use;
- Accelerated availability of solutions and products to paediatric patients in need;
- Wider access to rationally designed research infrastructure services across Europe to underpin the competitiveness of the European industry and of biotech SMEs developing paediatric medicines and treatment and diagnostic devices;
- Joined forces of research infrastructures and paediatric competence networks in EU Member States and Associated Countries, to facilitate paediatric research in the context of pertinent EU regulatory environment;
- Availability of innovative tools to conduct paediatric clinical trials, for the re-use of population and historical data, and for enhanced data sharing across actors at different care levels and across regions in Europe.

Area 3: research infrastructure services to enable research linking environmental factors to human health:

- Better risk assessment tools and data evidence to anticipate and mitigate negative environmental implications on human health;
- Evidence to inform policy making and public health bodies with respect to assessment and management of environmental risks for human health;
- Wider access to specialised research infrastructure services to underpin the competitiveness of the European industry including SMEs active in the field of risk assessment and management of environmental impact on human health.
- Link with the environmental research on the exposure to other living organisms within the One-Health concept.

Scope:

This topic aims at providing trans-national access (on-site or remote) and/or virtual access to integrated and customised research infrastructures services for challenge-driven research and innovation in each of the areas listed below, all related to the health domain, offered by a wide range of complementary and interdisciplinary top level research infrastructures.

Access also includes ad hoc users' training and scientific and technical support. Training courses for using the infrastructures may also be supported. Training courses and ad hoc users' training will prepare the new generations of researchers to properly exploit leading-edge research infrastructures, and should provide them with appropriate skills for data stewardship.

Activities to facilitate and integrate the access procedures, to further develop the remote or virtual provision of services and to improve, customise and harmonise the services the infrastructures will also be supported, including for better serving the needs of open EU industrial research and innovation.

The main goal of this topic is access provision to existing services: this should be clearly reflected by the proposed activities and the allocated resources. The improvement and optimisation of the offered services and the development of new services, relevant to the challenges, will also be supported, including joint/cross- research infrastructures services provided the resulting services are opened and offered already under the actions (short term R&D) and that the long-term sustainability of such services is ensured by the participant research infrastructures. Further development of new or improved services for use in the mid-term (2-3 years) may also be supported when duly justified e.g. to address well-identified needs such as in the ESFRI Landscape Analysis, or in the research agendas of Horizon Europe Pillar II Missions or European Partnerships. The topic will not support longer-term R&D for new instrumentation, tools, methods and advanced digital solutions.

Proposals should adhere to the guidelines and principles of the European Charter for Access to Research Infrastructures⁴⁵

Data management (and related ethics issues), interoperability, as well as the connection of digital services (e.g. data services) to the European Open Science Cloud, should be addressed where relevant.

Proposals should take due account of major European or international initiatives relevant in the domain. When appropriate, they should foster the use and deployment of (open) global standards.

Proposals should make available to researchers a wide, inclusive and comprehensive portfolio of complementary research infrastructure services, including data services, and customised workflows to enable R&I addressing the set challenge. To this extent, they should involve - as beneficiaries, affiliated entities, third parties, or external providers of purchased services - the

⁴⁵ <https://op.europa.eu/publication-detail/-/publication/ec4692ae-ac6f-11ef-acb1-01aa75ed71a1>

necessary interdisciplinary set of research infrastructures of European interest⁴⁶ that provide such services.

Proposed actions should ensure that they are strongly linked to research infrastructures of pan-European relevance, as prioritised by ESFRI and the ERICs. Therefore, proposals should include at least one ESFRI Landmark⁴⁷ or European Research Infrastructure Consortium (ERIC)⁴⁸ as beneficiary. In case of a distributed⁴⁹ ERIC, as an alternative to the ERIC participating as a beneficiary, a legal entity that is hosting ERIC facilities, resources or related services may participate as a beneficiary. A declaration signed by the legal representative of the ERIC should confirm that the ERIC is supporting this participation, explain the relevance for the ERIC and describe any further cooperation with the ERIC.

Access could also be open, in accordance with the ‘Specific Features for Research Infrastructure’ section of this Work Programme, to third countries’ researchers to work on global challenges. Research infrastructures from third countries⁵⁰ may be involved when appropriate. However, such research infrastructures should only be involved, as beneficiaries or affiliated entities, if they offer complementary or more advanced services than those available in EU Member States and Associated Countries.

Proposals should include an outreach and engagement plan to actively advertise their services to targeted research communities, notably from Widening countries and, if applicable, to relevant industries, including SMEs.

Proposals are expected to exploit synergies and to ensure complementarity and coherence with other EU grants supporting access provision.

Proposals should include the list of services/installations⁵¹ opened by research infrastructures for trans-national or virtual access and the amounts of units of access made available for users. Further conditions and requirements relating to access provisions that applicants should fulfil when drafting a proposal are given in the “Specific features for Research Infrastructures” section of this work programme part. Compliance with these provisions will be taken into account during evaluation.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement. However, where applicable, proposals should promote in their calls for access the integration of the gender dimension in the research and innovation content of the users applying to these calls.

⁴⁶ A research infrastructure is of European interest when is able to attract users from EU or associated countries other than the country where the infrastructure is located. This includes ESFRI and ERIC infrastructures.

⁴⁷ See lists of ESFRI ‘Landmarks’ in the 2021 ESFRI Roadmap on <https://roadmap2021.esfri.eu/>
⁴⁸ [European Research Infrastructure Consortium \(ERIC\) | European Commission \(europa.eu\)](https://roadmap2021.esfri.eu/)

⁴⁹ The term ‘distributed’ research infrastructure typically refers to one or a few central hubs and several interlinked (national or institutional) nodes where many components of the research infrastructure may not be part of the same legal entity, the ERIC.

⁵⁰ See the Eligibility conditions for this topic.

⁵¹ “Installation” means a part or a service of a research infrastructure that can be used independently from the rest. A research infrastructure consists of one or more installations.

The topic targets the following scientific challenges and EU priority areas related to the health domain. Proposals are expected to address one of the following areas and must explicitly state which area they address:

Area 1: Research infrastructure services to support research and development of medical countermeasures for epidemic response

The proposals in this area should build on the integrated research infrastructure services comprehensive and inclusive portfolio to support epidemic preparedness research, provide the capacity to respond to infectious disease epidemics, and underpin leading research in the domain. It should build on work already carried out following the [HORIZON-INFRA-2021-EMERGENCY-02](#) call and the ISIDORE project.

The proposed action should support the provision of trans-national and/or virtual access to researchers, training for using the infrastructures, activities to improve and customise the services the infrastructures provide, as well as facilitating and integrating access procedures, and further developing the remote or virtual provision of services. Proposals should foster increased access to national research infrastructures through outreach activities targeting relevant user communities.

Access to research infrastructure services should be provided to users to support their research projects targeting: i) basic research meant to increase knowledge on pathogens with epidemic potential, and/or ii) the development of new or adapted prevention and/or intervention tools and measures. These include new or adapted diagnostic procedures and therapies, drugs, vaccines, or disease vector control.

Reflecting the One-Health concept, services supporting research on transmission of pathogens from animals to humans (or vice versa, animals as host reservoir), including vector-borne transmission, should be covered. Flexibility in the provision of services should be properly demonstrated to ensure fast re-orientation and expansion of the portfolio in response to unexpected epidemics situations. Effective operational links established within the ISIDORE project with the epidemics risk assessment and management bodies like ECDC, WHO, WOA, and EU-HERA should be ensured. Furthermore, alignment with the future Pandemic Preparedness partnership should be taken into consideration. Global standards, relevant data platforms and registries should be used to make user project results FAIR and usable, thus enabling further research on pathogens and disease manifestation.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) research infrastructure (Nanobiotechnology laboratory) in their research infrastructure portfolio for biophysical characterisation of recombinant proteins, antigens, therapeutic antibodies, lipid nanoparticles therapeutic and its expertise at the interface between the research activities and regulatory aspects. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

Area 2: Research infrastructure services for improving clinical research in the paediatric area

Paediatric healthcare in EU and worldwide is often hampered by an enduring lack of specific medicines and therapies tailored for use in paediatric population. Proposals should integrate and give access to research infrastructure services to enable and accelerate R&I towards innovative biomedical products and therapies for children, including new-borns. They should support in particular, but not limited to, clinical R&I projects addressing therapeutic, diagnostic and prevention measures for paediatric disease management and help these projects to meet regulatory requirements for licensure and clinical use of paediatric medicines and medical devices.

Due to the peculiarities of paediatric clinical research with study subjects often dispersed across Europe, research infrastructure services offered should include innovative trial designs and novel monitoring tools, including the necessary support at local level. GDPR compliant and regulatory acceptable access and re-use of relevant population, historical and real world care data should be facilitated, as should be the harmonisation of respective ethics reviews across Europe.

As paediatric research is often faced with locally dispersed case incidences, wider geographical outreach and international collaboration beyond Europe, including with LMIC (Low-to-Middle-Income Country) is strongly encouraged.

Appropriate links and alignment should be ensured with EU level initiatives such as EnprEMA, and Horizon Europe partnerships such as the Innovative Health Initiative, the Transforming Health and Care Systems partnership, the Personalised Medicine partnership (EP PerMed), the ERA for Health Research (ERA4Health), and the partnership on Rare Diseases research (ERDERA).

Data management should duly cater for interoperability of data services, while contributing to GDPR compliant access modalities as required in the European Health Data Space. Metadata, statistical and anonymised data sets should duly comply with FAIR principles to become accessible under the European Open Science Cloud.

Area 3: Research infrastructure services to enable research linking environmental factors to human health

Human health is strongly dependant on exposure to environmental factors⁵² with 10% of all premature deaths in EU linked to environmental pollution.⁵³.. Proposals should integrate and give access to a wide range of monitoring and experimental research infrastructure services to investigate the effect of environmental exposure. Services should be provided to user projects aiming to characterize environmental risk factors (e.g. of chronic health conditions) and/or to develop innovative tools and methods for deciphering the causal pathways and the prevention

⁵² Physical substance (solids, liquids or gas) or energy (e.g. noise, light, electromagnetic fields, radioactive radiation, etc.) present in the environment.

⁵³ EEA: <https://www.eea.europa.eu/en/topics/at-a-glance/health>

of associated diseases. Integration of multiple types of data reaching from environmental exposure measurements to granular human omics, analytical and clinical data including also socio-economic and lifestyle data, in line with One-Health approach, is key for this type of research at the interface of environmental and health research.

Proposals in this area should customise and further develop research infrastructure services to meet the needs of ongoing research in the field. Appropriate links and complementarities should be ensured with relevant ongoing initiatives and resources, such as pertinent ESFRI roadmap efforts, e.g. EIRENE⁵⁴, the European Human Exposome Network (EHEN), the Information Platform for Chemical Monitoring (IPCHEM), the EC Knowledge Centre on Cancer⁵⁵, the European Microwave Signature Laboratory, the European Partnership for the Assessment of Risks from Chemicals (PARC), and other Horizon Europe relevant projects including the ones emerging from the 2023 and 2024 ‘Environment and health’ calls of Cluster 1 - Health.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) research infrastructure (Water Laboratory) in their research infrastructure portfolio for wastewater surveillance for various application fields from One-Health use cases, biosecurity and water resilience including water reuse and irrigation, as well as its expertise at the interface between the research activities and regulatory aspects. Proposals could also consider the inclusion of the JRC's High Throughput Testing (HTT) facility, which automates in vitro toxicology methods to generate large datasets from bespoke chemical libraries. Such data can be used in a variety of ways to explore potential links between exposure to environmental chemicals and their mixtures and adverse effects on human health. The JRC will consider collaborating with any successful proposal.

HORIZON-INFRA-2025-01-SERV-02: Research infrastructure services to enable R&I addressing main challenges and EU priorities

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 20.00 million.
<i>Type of Action</i>	Research and Innovation Actions

⁵⁴ [EIRENE RI](#), Research Infrastructure for EnvIRonmental Exposure assessment in Europe

⁵⁵ The knowledge centre on Cancer and its five pillars: 1) [Health Promotion and Disease Prevention Knowledge Gateway](#) 2) [The European Cancer Information System](#) (ECIS) and the [European Network of Cancer Registries](#) (ENCR) 3) [The European Commission Initiatives on Breast and Colorectal Cancers](#) 4) [The Cancer Inequalities Registry](#), 5) [The European Platform on Rare Disease Registration](#) (EU RD Platform)

<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants are not required to include in their proposal a plan for the exploitation and dissemination of the results as the main objective of these actions is the service provision.</p> <p>As proposals need to give information on the research infrastructures providing access, the page limit of the application is 100 pages.</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>Given the specific nature of this topic, access provision activities must be included in the proposal. Please read carefully the provisions under the section “Specific features for Research Infrastructures” of this work programme part before preparing your application.</p> <p>Considering the Union’s interest to make accessible to its researchers the most advanced research infrastructures, wherever they are in the world, legal entities established in Australia, Brazil, Canada, Chile, India, Japan, Mexico, New Zealand, Republic of Korea, Singapore, Switzerland, and USA, which provide, under the grant, access to their research infrastructures to researchers from Member States and Associated Countries, are exceptionally eligible for funding from the Union under this topic.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. <i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs may take form of unit costs for trans-national and virtual access to research infrastructures as defined in the Decision authorising the use of unit costs for the actions involving trans-national and virtual access (see Annex 2a of the Horizon Europe Model Grant Agreement).</p>

Expected Outcome:

For all areas:

- Provision of innovative, customised and efficient research infrastructures services enhancing and increasing society's long-term and consistent problem-solving capacity and evidence-based policy making.

Project results are expected to contribute to all of the following expected outcomes for one of the areas:

Area 1: research infrastructure services for advanced biotechnology and biomanufacturing:

- Reinforced support for breakthrough research and innovation for advancing industrial biotechnology.
- Wider access for academic and industrial researchers to enhanced and further integrated research infrastructure services in the field.
- Cross-fertilisation and wider sharing of knowledge and technologies across the relevant scientific disciplines and sectors.
- Harmonisation and development of standards, and sharing of best practices ensuring scientific reproducibility in the field.
- Enhanced and further integrated research infrastructures capacities in support of the European Green Deal objectives, the EU's objectives for open strategic autonomy and resilience and the actions and priorities of the Commission communication "Building the

future with nature: Boosting Biotechnology and Biomanufacturing in the EU⁵⁶”.

Area 2: research infrastructure services for access to novel radionuclides and facilities:

- Research in radionuclides facilitated, contributing to the development of medical treatments and to the underlying required supply of stable or radio-isotopes for these treatments.
- Contribution of research infrastructures and scientific services to the EU action plan to support the safe, high quality and reliable use of radiological and nuclear technology in healthcare.

Area 3: research infrastructure services to improve the understanding and prediction of future climate changes and their impact:

- Reinforced support for cutting-edge research and innovation in understanding and predicting future climate changes and their impacts
- Wider, user-friendly and coordinated access for researchers to enhanced and further integrated state-of-the-art Earth system models, including high resolution or high complexity models and relevant high-performance computing resources
- More robust evidence underpinning the assessments of the Intergovernmental Panel on Climate Change (IPCC) about the state of scientific, technical and socio-economic knowledge on climate change, its impacts, risks and response options.
- More effective climate policies in the context of the implementation of the European Green Deal, the European Climate Law, and the Paris Agreement.

Area 4: research infrastructure services for new aviation fuels and combustion technologies

- enabling research and innovation in the field of new aviation fuels and combustion technologies to support European scientific and industrial competitiveness, including on adaption and expansion of existing test combustion capabilities to use new fuels (in particular biogenic and synthetic sustainable aviation fuels, liquid hydrogen) for future propulsion systems, referee-test rigs for the assessment of the potential and characteristics of sustainable aviation fuels in respect to safety and reliability (in contrast to Jet A1 using application-oriented combustion system including concept and design work based on known referee-rigs), test rigs that support the approval and qualification of SAF candidates entering ASTM D4054 (Tier 2.5)

⁵⁶ COMMUNICATION FROM THE COMMISSION TO THE EUROPEAN PARLIAMENT, THE COUNCIL, THE EUROPEAN ECONOMIC AND SOCIAL COMMITTEE AND THE COMMITTEE OF THE REGIONS [Building the future with nature: Boosting Biotechnology and Biomanufacturing in the EU](#)

- wider access for academic and industrial researchers to enhanced and further integrated RI services for fostering the testing of sustainable fuels to address emerging socio-economic needs;
- enhanced competitiveness of European aviation industry in the field through access to the broadest spectrum of advanced research tools and providing resources and services for research communities to conduct research and foster innovation in the field;
- positioning the top-level research infrastructures in the field as reliable innovation partners for world-wide researchers and European innovators
- where relevant, test beds may be used beyond research, e.g. for education and training.

Scope:

For all areas:

This topic aims at providing trans-national access (on-site or remote) and/or virtual access to integrated and customised research infrastructure services for challenge-driven research and innovation in each of the areas listed below, offered by a wide range of complementary and interdisciplinary top level research infrastructures.

Access also includes ad hoc users' training and scientific and technical support. Training courses for using the infrastructures may also be supported. Training courses and ad hoc users' training will prepare the new generations of researchers to properly exploit leading-edge research infrastructures, and should provide them with appropriate skills for data stewardship.

Activities to facilitate and integrate the access procedures, to further develop the remote or virtual provision of services and to improve, customise and harmonise the services the infrastructures will also be supported, including for better serving the needs of open EU industrial research and innovation.

The main goal of this topic is access provision to existing services: this should be clearly reflected by the proposed activities and the allocated resources. The improvement and optimisation of the offered services and the development of new services, relevant to the challenges, will also be supported, including joint/cross-research infrastructure services provided the resulting services are opened and offered already under the actions (short term R&D) and that the long-term sustainability of such services is ensured by the participant research infrastructures. Further development of new or improved services for use in the mid-term (2-3 years) may also be supported when duly justified e.g. to address well identified needs such as in the ESFRI Landscape Analysis, or in the research agendas of Horizon Europe Missions or Partnerships. The topic will not support longer-term R&D for new instrumentation, tools, methods and advanced digital solutions.

Proposals should adhere to the guidelines and principles of the European Charter for Access to Research Infrastructures⁵⁷

Data management (and related ethics issues), interoperability, as well as the connection of digital services (e.g. data services) to the European Open Science Cloud, should be addressed where relevant.

Proposals should take due account of major European or international initiatives relevant in the domain. When appropriate, they should foster the use and deployment of (open) global standards.

Proposals should make available to researchers a wide, inclusive and comprehensive portfolio of complementary research infrastructure services, including data services, and customised workflows to enable R&I addressing the set challenge. To this extent, they should involve - as beneficiaries, affiliated entities, third parties, or external providers of purchased services - the necessary interdisciplinary set of research infrastructures of European interest⁵⁸ that provide such services.

Proposed actions should ensure that they are strongly linked to research infrastructures of pan-European relevance, as prioritised by ESFRI and the ERICs. Therefore, proposals should include at least one ESFRI Landmark⁵⁹ or European Research Infrastructure Consortium (ERIC)⁶⁰ as beneficiary. In case of a distributed⁶¹ ERIC, as an alternative to the ERIC participating as a beneficiary, a legal entity that is hosting ERIC facilities, resources or related services may participate as a beneficiary. A declaration signed by the legal representative of the ERIC should confirm that the ERIC is supporting this participation, explain the relevance for the ERIC and describe any further cooperation with the ERIC.

Access could also be open, in accordance with the ‘Specific Features for Research Infrastructure’ section of this Work Programme, to third countries’ researchers to work on global challenges. Research infrastructures from third countries⁶² may be involved when appropriate. However, such research infrastructures should only be involved, as beneficiaries or affiliated entities, if they offer complementary or more advanced services than those available in EU Member States and Associated Countries.

⁵⁷ <https://op.europa.eu/en/publication-detail/-/publication/ec4692ae-ac6f-11ef-acb1-01aa75ed71a1>

⁵⁸ A research infrastructure is of European interest when is able to attract users from EU or associated countries other than the country where the infrastructure is located. This includes ESFRI and ERIC infrastructures.

⁵⁹ See lists of ESFRI ‘Landmarks’ in the 2021 ESFRI Roadmap on [https://roadmap2021.esfri.eu/European_Research_Infrastructure_Consortium_\(ERIC\)_|_European_Commission_\(europa.eu\)](https://roadmap2021.esfri.eu/European_Research_Infrastructure_Consortium_(ERIC)_|_European_Commission_(europa.eu))

⁶⁰ The term ‘distributed’ research infrastructure typically refers to one or a few central hubs and several interlinked (national or institutional) nodes where many components of the research infrastructure may not be part of the same legal entity, the ERIC

⁶² See the Eligibility conditions for this topic. The Strategic Agenda for Medical Ionising Radiation Applications (SAMIRA) contributes to [Europe's Beating Cancer Plan](#), and responds to the EU Council's conclusion from 24 May 2019 on [non-power nuclear and radiological technologies and applications](#)

Proposals should include an outreach and engagement plan to actively advertise their services to targeted research communities, notably from Widening countries and, if applicable, to relevant industries, including SMEs.

Proposals are expected to exploit synergies and to ensure complementarity and coherence with other EU grants supporting access provision.

Proposals should include the list of services/installations⁶³ opened by research infrastructures for trans-national or virtual access and the amounts of units of access made available for users. Further conditions and requirements relating to access provisions that applicants should fulfil when drafting a proposal are given in the “Specific features for Research Infrastructures” section of this work programme part. Compliance with these provisions will be taken into account during evaluation.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

The topic targets the following areas related to scientific challenges and EU priorities. Proposals are expected to address one of the areas and must explicitly state which area they address:

Area 1: research infrastructure services for advanced biotechnology and biomanufacturing

The advances in life sciences, supported by digitalisation and artificial intelligence (AI), and the potential of solutions based on biology to solve societal issues, make biotechnology and biomanufacturing very promising technological areas. They can help the EU to modernise its agriculture, forestry, energy, food and feed sectors and industry. In addition, these technologies can contribute to a more competitive and resilient EU, that provides better healthcare to its citizens, and succeeds in its green and digital transitions.

To further leverage research and boost innovation, a more productive use of relevant research infrastructures must be facilitated with specific attention to accelerating the use of the Industrial Biotechnology Innovation and Synthetic Biology Accelerator (EU IBISBA) as a trusted digital repository and service network for the sector.

Building on past integration of access to facilities and services, research infrastructures in the field are invited to reach a higher and more interdisciplinary level of integration to offer access, through a single entry point, to a coherent and complementary set of services, customising and combining them when necessary, to support academic and industrial research teams in support notably of the actions and priorities set out in the Commission Communication “Building the future with nature: Boosting Biotechnology and Biomanufacturing in the EU”.

⁶³ “Installation” means a part or a service of a research infrastructure that can be used independently from the rest. A research infrastructure consists of one or more installations.

Users should benefit from the harmonisation of standards, share of best practices and development of working standards promoted by the access providers, ensuring reproducibility and interoperability and accelerating the translation of knowledge into innovation. Users should also benefit from most recent efforts towards digitalisation of research infrastructures services and access to bioprocess data.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) research infrastructure (Nanobiotechnology laboratory and Environmental biotechnology laboratory) in their research portfolio for the characterization of advanced biotechnology products and systems and its expertise at the interface between innovation, regulatory sciences and policy. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

Area 2: research infrastructures services for access to novel radionuclides and facilities

Proposals should carry out all of the following activities:

- Build on the work carried out by the PRISMAP project in establishing a network of world-leading European facilities, including nuclear reactors, accelerators and radiochemical laboratories, offering a broad catalogue of radionuclides for medical research. The network must offer researchers access to radionuclides and to the complementary biomedical facilities.
- Offer services for:
 - o the production and delivery of high purity radionuclides;
 - o associated research in biomedical facilities;
 - o supporting translational research and preclinical research techniques, either self-service or fully performed as a service.
- Investigating towards the development of upscaling of the production of these novel radionuclides, in the form of novel production technology, new purification methods, and proof-of-concept investigations showing the development of new treatments from test bench to patient care.
- Monitoring and engagement with other initiatives supporting the EU SAMIRA⁶⁴ action plan, in particular as regards the supply of novel (stable or radio-) isotopes and the development of innovative production methods, based on existing or new facilities.
- Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) research infrastructure PAMEC (Properties of Actinide Materials under

⁶⁴ See the Eligibility conditions for this topic. The Strategic Agenda for Medical Ionising Radiation Applications (SAMIRA) contributes to [Europe's Beating Cancer Plan](#), and responds to the EU Council's conclusion from 24 May 2019 on [non-power nuclear and radiological technologies and applications](#)

Extreme Conditions) and FMR (Fuel for Material Research) in Karlsruhe, Germany, in their research infrastructure portfolio. The infrastructure is used and available for research into novel therapeutic medical radionuclides, including alternative production paths based on radionuclide such as but not limited to technetium, uranium or thorium targets, as well as the development of novel compounds for the treatment of various tumors by radioligand therapy. In this regard, the JRC will consider collaborating with any successful proposal in these areas and this collaboration, when relevant and upon availability of the radionuclide, should be established after feasibility study by local contact and the proposal's approval.

Area 3: research infrastructure services to improve the understanding and prediction of future climate changes and their impact.

Meeting the goals of the Paris Agreement and achieving climate neutrality by 2050 in the EU require strengthening and continuously updating the underpinning scientific evidence base. This includes improving the knowledge of the Earth system, its recent evolution and future responses under different global emissions pathways and socio-economic scenarios while establishing stronger linkages with integrated assessment and impact modelling communities. State-of-the-art Earth's climate system models are essential for advanced understanding and capability to analyse the recent past and predict the future evolution of the coupled Earth system, at global to regional or more local scales, and across timescales.

Projects should provide access to a wide portfolio of world-class and complementary services in the field of Earth climate system modelling, such as models, software, high-performance computing resources, and data to enable efficient production, evaluation, and exploitation of model simulations, as well as rapid and reliable exchange of knowledge across multiple projects, models, and modelling communities in Europe and globally, and also with policymakers, planners, and climate services. Proposals should ensure appropriate links with relevant European and international initiatives such as projects supported under Horizon Europe Cluster 5 Destination 1 "Climate sciences and responses for the transformation towards climate neutrality", the EU Mission on Adaptation to Climate Change, and Destination Earth.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) research infrastructure (Marine Optical laboratory - MARlab) in their research infrastructure portfolio for supporting Earth Observations of the aquatic environment through highly accurate bio-optical in situ reference measurements and modelling, as well as its expertise at the interface between the research activities and regulatory aspects. In this regard, the JRC will consider collaborating with any successful proposal.

Area 4: research infrastructures services for New Aviation Fuels and Combustion Technologies

With the ratification of the ReFuelEU Aviation initiative, the extensive use of sustainable fuels in European aviation will become legally binding. The development of a competitive European industry for the production of sustainable fuels requires, on the one hand, the

consideration of a large number of sustainable raw materials as a starting point for the production process but also the introduction of alternative energy sources (especially liquid hydrogen). Due to the extremely high safety requirements, comprehensive test series in the development and investigation of the effects of these fuels on the various system elements of air traffic (this includes aircraft systems, refuelling vehicles, pipeline systems and much more) are of great importance for subsequent certification, as the foundation for a market uptake of sustainable aviation fuels.

To enlarge the array of sustainable feedstocks and applications and push further the use of new aviation fuels and combustion technologies for finding effective solutions to emerging socio-economic needs, researchers and innovators need the most advanced research and testing facilities.

The research infrastructures in the field including those relevant for adaption and expansion of existing test combustion capabilities to use new fuels for future propulsion systems, referee-test rigs for the assessment of the potential and characteristics of sustainable aviation fuels in respect to safety and reliability and test rigs that support the approval and qualification of SAF candidates entering ASTM D4054 (Tier 2.5) should build on past integration of access to their facilities in previous Framework Programmes and reach an higher and more interdisciplinary level of integration to offer access, through a single entry point, to a coherent and complementary set of services, customising and combining them when necessary, to support academic and industrial research teams.

Proposals could consider, for their inclusion in the service portfolio, relevant services and expertise offered by the European Commission's Joint Research Centre (JRC).

HORIZON-INFRA-2025-01-SERV-03: Research infrastructure services advancing frontier knowledge

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 20.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants are not required to include in their proposal a plan for the exploitation and dissemination of the results as the main objective of</p>

	<p>these actions is the service provision.</p> <p>As proposals need to give information on the research infrastructures providing access, the page limit of the application is 100 pages.</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>Given the specific nature of this topic, access provision activities must be included in the proposal. Please read carefully the provisions under the section “Specific features for Research Infrastructures” of this work programme part before preparing your application.</p> <p>Considering the Union’s interest to make accessible to its researchers the most advanced research infrastructures, wherever they are in the world, legal entities established in Australia, Brazil, Canada, Chile, India, Japan, Mexico, New Zealand, Republic of Korea, Singapore, Switzerland, and USA, which provide, under the grant, access to their research infrastructures to researchers from Member States and Associated Countries, are exceptionally eligible for funding from the Union under this topic.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The following additions to the general award criteria apply:</p> <p><i>For the 'Excellence' criterion</i>, the additional following aspects will also be taken into account:</p> <ul style="list-style-type: none"> • The extent to which the access activities (trans-national and/or virtual access) will offer access to the state-of-the-art infrastructures of European interest in the field, high quality services, and will enable users to conduct excellent research. • The extent to which the project will contribute to facilitating and integrating the access procedures, to improve the services the infrastructures provide and to further develop their on-line services.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio covering the different areas, grants will be awarded to applications not only in order of ranking but at least also to those proposals that are the highest ranked within each area, provided that the applications attain all thresholds.</p>

<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>The funding rate is 80% of the eligible costs.</p> <p>Eligible costs may take form of unit costs for trans-national and virtual access to research infrastructures as defined in the Decision authorising the use of unit costs for the actions involving trans-national and virtual access (see Annex 2a of the Horizon Europe Model Grant Agreement).</p>
---	---

Expected Outcome: Project results are expected to contribute to all the following expected outcomes:

- Wider, simplified, and more efficient access to the best research infrastructures available to researchers to conduct curiosity-driven research, irrespective of location;
- Breakthrough and leading-edge research enabled by advanced research infrastructure services, including from emerging facilities, made available to a wider user community, including in emerging areas of research;
- Improved and harmonised research infrastructure services and broader and more balanced use of research infrastructure resources across the EU and Associated Countries deriving from the exploitation of synergies and complementarities;
- A new generation of researchers trained to optimally exploit all the essential tools for their research;
- Cross-disciplinary fertilisations and a wider sharing of information, knowledge and technologies across scientific fields fostered by closer interactions between researchers active in and around research infrastructures;
- Better management, including implementing FAIR data principle, of the continuous flow of data collected or produced by research infrastructures.

Scope:

This topic aims at providing trans-national access (on-site or remote) and/or virtual access to integrated and customised research infrastructure services for curiosity-driven research in wide scientific domains, offered by a wide range of complementary and interdisciplinary top level research infrastructures. Given the funding rate, the topic also aims at fostering the sustainability of the access scheme. Proposals are expected to address one domain area and must explicitly state which area they address.

The scientific domains covered under this topic are:

- Area 1: Environment: atmospheric chemistry and dynamics.
- Area 2: Physical sciences and engineering: hadron physics.

For Area 2, proposers should fully exploit transversal links to and identify common developments with neighbouring communities within the field of particle and nuclear physics building on the work of recent Horizon projects where applicable.

Access also includes ad hoc users' training and scientific and technical support. Training courses for using the infrastructures may also be supported. Training courses and ad hoc users' training will prepare the new generations of researchers to properly exploit leading-edge research infrastructures, and should provide them with appropriate skills for data stewardship.

Activities to facilitate and integrate the access procedures, to further develop the remote or virtual provision of services and to improve, customise and harmonise the services the infrastructures will also be supported.

The main goal of this topic is access provision to existing services: this should be clearly reflected by the proposed activities and the allocated resources. The improvement and optimisation of the offered services and the development of new services, relevant to specific scientific challenges in the identified domains, can also be supported, including joint/cross-research infrastructure services, provided that the resulting services are opened and offered already under the actions (short-term R&D) and that the long-term sustainability of such services is ensured by the participant research infrastructures. This topic will not support longer-term R&D for new instrumentation, tools, methods and advanced digital solutions.

Proposals should adhere to the guidelines and principles of the European Charter for Access to Research Infrastructures⁶⁵.

Data management (and related ethics issues), interoperability, as well as the connection of digital services (e.g. data services) to the European Open Science Cloud, should be addressed where relevant.

Proposals should take due account of major European or international initiatives relevant in the domain. When appropriate, they should foster the use and deployment of (open) global standards.

Proposals should make available to researchers a very wide, inclusive and comprehensive portfolio of complementary research infrastructure services, including data services, which are relevant for frontier research in the domain. To this extent, they should involve, as beneficiaries, affiliated entities, third parties, or external providers of purchased services, the necessary interdisciplinary set of research infrastructures of European interest⁶⁶ that provide such services, including, if applicable, from emerging facilities.

Proposed actions should ensure that they are strongly linked to research infrastructures of pan-European relevance, as prioritised by ESFRI and the ERICs. Therefore, proposals should

⁶⁶ A research infrastructure is of European interest when is able to attract users from EU or associated countries other than the country where the infrastructure is located. This includes ESFRI and ERIC infrastructures.

include at least one ESFRI Landmark⁶⁷ or European Research Infrastructure Consortium (ERIC)⁶⁸ as beneficiary. In case of a distributed⁶⁹ ERIC, as an alternative to the ERIC participating as a beneficiary, a legal entity that is hosting ERIC facilities, resources or related services may participate as a beneficiary. A declaration signed by the legal representative of the ERIC should confirm that the ERIC is supporting this participation, explain the relevance for the ERIC and describe any further cooperation with the ERIC.

Access could also be open, in accordance with the ‘Specific Features for Research Infrastructure’ section of this Work Programme, to third countries’ researchers to work on global scientific challenges. Research infrastructures from third countries⁷⁰ may be involved when appropriate. However, such research infrastructures should only be involved, as beneficiaries or affiliated entities, if they offer complementary or more advanced services than those available in the EU Member States and Associated Countries.

Proposals should include an outreach and engagement plan to actively advertise their services to the research communities, notably from Widening countries in the specific domains.

Proposals are expected to exploit synergies and to ensure complementarity and coherence with other EU grants supporting access provision.

Proposals should include the list of services/installations⁷¹ opened by research infrastructures for trans-national or virtual access and the amounts of units of access made available for users. Further conditions and requirements relating to access provisions that applicants should fulfil when drafting a proposal are given in the “Specific features for Research Infrastructures” section of this work programme part. Compliance with these provisions will be taken into account during evaluation. In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

HORIZON-INFRA-2025-01-SERV-04: Research infrastructure services advancing frontier knowledge (bottom-up)

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

- Better management, including implementing FAIR data principle, of the continuous flow of data collected or produced by research infrastructures.

Scope: This topic aims at providing trans-national access (on-site or remote) and/or virtual access to integrated and customised research infrastructure services for curiosity-driven

⁷² As defined in [2021 ESFRI Roadmap](#): 1. Data, Computing and Digital Research Infrastructures; 2. Energy; 3. Environment; 4. Health & Food; 5. Physical Sciences and Engineering; 6. Social Sciences & Humanities.

research in wide scientific domains, offered by a wide range of complementary and interdisciplinary top level research infrastructures. Given the funding rate, the topic also aims at fostering the sustainability of the access scheme. Proposals are expected to address one domain and must explicitly state which domain (and sub-domain if appropriate) they address among the scientific domains not covered by Horizon Europe Research Infrastructures part of Work Programme 2023 to 2025, curiosity- driven INFRASERV topics⁷³.

Access also includes ad hoc users' training and scientific and technical support. Training courses for using the infrastructures may also be supported. Training courses and ad hoc users' training will prepare the new generations of researchers to properly exploit leading-edge research infrastructures, and should provide them with appropriate skills for data stewardship.

Activities to facilitate and integrate the access procedures, to further develop the remote or virtual provision of services and to improve, customise and harmonise the services the infrastructures will also be supported.

The main goal of this topic is access provision to existing services: this should be clearly reflected by the proposed activities and the allocated resources. The improvement and optimisation of the offered services and the development of new services, relevant to specific scientific challenges in the identified domains, can also be supported, including joint/cross-research infrastructure services, provided that the resulting services are opened and offered already under the actions (short-term R&D) and that the long-term sustainability of such services is ensured by the participant research infrastructures. This topic will not support longer-term R&D for new instrumentation, tools, methods and advanced digital solutions.

Proposals should adhere to the guidelines and principles of the European Charter for Access to Research Infrastructures⁷⁴

Data management (and related ethics issues), interoperability, as well as the connection of digital services (e.g. data services) to the European Open Science Cloud, should be addressed where relevant.

Proposals should take due account of major European or international initiatives relevant in the domain. When appropriate, they should foster the use and deployment of (open) global standards.

Proposals should make available to researchers a very wide, inclusive and comprehensive portfolio of complementary research infrastructure services, including data services, which are relevant for frontier research in the domain. To this extent, they should involve, as beneficiaries, affiliated entities, third parties, or external providers of purchased services, the

⁷³ Therefore, excluding the following domains/sub-domains: Environment/Biosphere: terrestrial biodiversity and ecosystems, including forest; Physical sciences and engineering/Astronomy and Astroparticle physics; Arts and Humanities; Environment / atmospheric chemistry and dynamics; Physical sciences and engineering:/ particle and nuclear physics.

⁷⁴ <https://op.europa.eu/en/publication-detail/-/publication/ec4692ae-ac6f-11ef-acb1-01aa75ed71a1>

necessary interdisciplinary set of research infrastructures of European interest⁷⁵ that provide such services, including, if applicable, from emerging facilities.

Proposed actions should ensure that they are strongly linked to research infrastructures of pan-European relevance, as prioritised by ESFRI and the ERICs. Therefore, proposals should include at least one ESFRI Landmark⁷⁶ or European Research Infrastructure Consortium (ERIC)⁷⁷ as beneficiary. In case of a distributed⁷⁸ ERIC, as an alternative to the ERIC participating as a beneficiary, a legal entity that is hosting ERIC facilities, resources or related services may participate as a beneficiary. A declaration signed by the legal representative of the ERIC should confirm that the ERIC is supporting this participation, explain the relevance for the ERIC and describe any further cooperation with the ERIC.

Access could also be open, in accordance with the ‘Specific Features for Research Infrastructure’ section of this Work Programme, to third countries’ researchers to work on global scientific challenges. Research infrastructures from third countries⁷⁹ may be involved when appropriate. However, such research infrastructures should only be involved, as beneficiaries or affiliated entities, if they offer complementary or more advanced services than those available in the EU Member States and Associated Countries.

Proposals should include an outreach and engagement plan to actively advertise their services to the research communities, notably from Widening countries in the specific domains.

Proposals are expected to exploit synergies and to ensure complementarity and coherence with other EU grants supporting access provision.

Proposals should include the list of services/installations⁸⁰ opened by research infrastructures for trans-national or virtual access and the amounts of units of access made available for users. Further conditions and requirements relating to access provisions that applicants should fulfil when drafting a proposal are given in the “Specific features for Research Infrastructures” section of this work programme part. Compliance with these provisions will be taken into account during evaluation. In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

⁷⁵ A research infrastructure is of European interest when is able to attract users from EU or associated countries other than the country where the infrastructure is located. This includes ESFRI and ERIC infrastructures.

⁷⁶ See lists of ESFRI ‘Landmarks’ in the 2021 ESFRI Roadmap on <https://roadmap2021.esfri.eu/>
⁷⁷ [European Research Infrastructure Consortium \(ERIC\) | European Commission \(europa.eu\)](https://roadmap2021.esfri.eu/)

⁷⁸ The term ‘distributed’ research infrastructure typically refers to one or a few central hubs and several interlinked (national or institutional) nodes where many components of the research infrastructure may not be part of the same legal entity, the ERIC.

⁷⁹ See the Eligibility conditions for this topic.

⁸⁰ “Installation” means a part or a service of a research infrastructure that can be used independently from the rest. A research infrastructure consists of one or more installations.

Destination INFRATECH - Next generation of scientific instrumentation, tools, methods, and advanced digital solutions of research infrastructures and foster innovation and co-creation with industry (2025)

Research infrastructures require constant technology development to maintain and upgrade their services and to create new ones. The manufacturing capacity of industry is often required for this, and the co-creation of technological components is a defining feature of many research infrastructures.

The expected impact of the activities supported under this part of the destination notably includes:

- Reinforced EU resilience with respect to the availability of critical technical research infrastructure components, considering that research infrastructure operations rely in many cases on technical components or material for which Europe is strongly dependent on third countries.
- More robust research infrastructure innovation ecosystems, building also on activities funded in the past on the development of research infrastructure technology roadmaps and co-creation activities with industry.
- Accelerated digitalisation of research infrastructures throughout their entire life cycle.
- Greening of research infrastructures, by advancing and accelerating the reduction of the environmental footprint of research infrastructures operations, while at the same time contributing to increasing their resilience towards energy crises or other resource restrictions such as water.
- The development of more robust research infrastructure innovation ecosystems, including the development and implementation of common research infrastructure technology roadmaps.

Destination Earth (DestinE) is a flagship initiative aiming to develop a highly- accurate, interactive digital model of the Earth to model, monitor and simulate natural phenomena, hazards and the related human activities. DestinE will provide an operational system to support decision-makers in designing accurate and actionable climate change adaptation strategies and mitigation measures.

The expected impact of the activities supported under this part of the destination notably includes:

- Exploitation of the rapid advances in modelling, observations, digital technologies and ML/AI, ensuring that European leadership in this field is maintained;
- Verification of modelling results using observations of research infrastructures in relevant fields;

- New Digital Twins and use cases to cover unexplored areas/domains, becoming part of the overall ecosystem, addressing EU priorities and evolving end-user needs; multi-disciplinary, horizontal, transversal infrastructure solutions to handle diverse end-to-end workflows spanning various areas.

Proposals are invited against the following topic(s):

HORIZON-INFRA-2025-01-TECH-01: New technologies and solutions for reducing the environmental and climate footprint of research infrastructures

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 25.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>The following additional eligibility criteria apply: due to the specific nature of this topic, proposals must include at least two different research infrastructures as beneficiaries⁸¹, each of them being an ESFRI Landmark⁸², a European Research Infrastructure Consortium (ERIC)⁸³ or another research infrastructure that is an international European research organisation⁸⁴. Such research infrastructures, and where applicable the beneficiaries that own/operate them, must be explicitly identified in the proposals.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions</p>

⁸¹ The participation of two nodes of the same ESFRI infrastructure or ERIC does not count as two different research infrastructures.

⁸² See the list of ESFRI 'Landmarks' in the 2021 ESFRI Roadmap: <https://roadmap2021.esfri.eu/>

⁸³ [European Research Infrastructure Consortium \(ERIC\) | European Commission \(europa.eu\)](https://roadmap2021.esfri.eu/)

⁸⁴ An 'international European research organisation' means an international organisation, the majority of whose members are Member States or associated countries, whose principal objective is to promote scientific and technological cooperation in Europe.

	under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁸⁵ .
--	--

Expected Outcome: Project results are expected to contribute to all the following expected outcomes:

- reduction of environmental (including climate-related) impacts;
- optimisation of resource and energy consumption integrated through the full life cycle of research infrastructures;
- increased long-term sustainability of the European research infrastructures ecosystem.

Scope: The aim of this topic is to deliver innovative technologies and solutions which generate a step change in reducing the environmental and climate footprint of research infrastructures through the full life cycle of research infrastructures. Proposals should identify common methodologies, among the concerned research infrastructures, to assess environmental impact and strategies to reduce it, as well as efficiency gains in the broader ecosystem.

The proposed action is expected to deliver on several of the following points, as relevant:

- new technologies and solutions for research infrastructures enabling transformative resource efficiency (e.g. reduced energy consumption) and reduction of environmental (including climate-related) impacts, including, when relevant, more sustainable and efficient ways of collecting, processing and providing access to data;
- validation and prototyping;
- training of research infrastructures staff for the operation and use of the new solutions;
- action plans to deploy new developments at wider scale and ensure their sustainability;
- measures to ensure an environmentally effective integration of the solutions in the local contexts;
- societal engagement to harvest and incorporate solutions from other relevant ecosystems and or to foster acceptance of the solutions in the local and regional communities.

Consortia should be built on a leading core of at least two different world-class research infrastructures, each of them being an ESFRI infrastructure, a European Research Infrastructure Consortium (ERIC) or another research infrastructure that is an

⁸⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

intergovernmental organisation of European interest, and can include a wider set of research infrastructures, and other technological partners.

Proposals should explain any synergies and complementarities with any related previous or current EU grants, including grants funded under other parts of Horizon Europe or Horizon 2020. Where relevant, proposals should ensure complementarity with actions funded under the 2023 call topic HORIZON-INFRA-2023-TECH-01-01 and clearly justify that different technologies and solutions are targeted.

Proposals could consider the inclusion of the European Commission's Joint Research Centre (JRC) Support Services Directorate in their research infrastructure portfolio. The JRC offers its experience in assessing, setting the strategy, maintaining, operating and providing access to external researchers to its research infrastructures in various fields of science. One of the main pillars of JRC's strategy is ensuring the sustainability of its research infrastructures, with measures to reduce energy consumption, improve energy efficiency, and promote the use of renewable energy sources. In this regard, the JRC will consider collaborating with any successful proposal.

HORIZON-INFRA-2025-01-TECH-02: Implementing research infrastructure technology roadmaps

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 45.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply: due to the specific nature of this topic, proposals must include at least two different research infrastructures as beneficiaries⁸⁶, each of them being an ESFRI Landmark⁸⁷, a European Research Infrastructure Consortium (ERIC)⁸⁸</p>

⁸⁶ The participation of two nodes of the same ESFRI infrastructure or ERIC does not count as two different research infrastructures.

⁸⁷ See the list of ESFRI 'Landmarks' in the 2021 ESFRI Roadmap: <https://roadmap2021.esfri.eu/>

⁸⁸ [European Research Infrastructure Consortium \(ERIC\) | European Commission \(europa.eu\)](#)

	or another research infrastructure that is an international European research organisation ⁸⁹ . Such research infrastructures, and where applicable the beneficiaries that own/operate them, must be explicitly identified in the proposals.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. Given the type of action (e.g. limited number of choices in specific technology fields) and its level of ambition, the maximum amount that can be granted to each third party may exceed the standard limit of EUR 60 000 if duly justified in the proposal.</p>

Expected Outcome: Project results are expected to contribute to several of the following expected outcomes:

- enhanced scientific and technological competitiveness of European research infrastructures;
- enhanced research infrastructure capacities to address research challenges and EU policy priorities;
- increased technological level of European industries through the co-development of advanced technologies for research infrastructures and creation of potential new markets;
- increased availability of research infrastructure component manufacturing capabilities currently not available in Europe;
- long-term integration of research infrastructures into local, regional and global research and innovation ecosystems;
- strengthened foundations for the development of innovative companies in Europe.

Scope: Research infrastructures require constant technology development to maintain and upgrade their services and to create new ones, to keep pace with the advancements of research and meet the requirements of emerging user communities from academia and innovation ecosystems. The manufacturing capacity of industry, including SMEs, is often required for this, and the co-creation of technological components is a defining feature of many research infrastructures. In some cases, manufacturing capabilities are lacking inside the EU, putting Europe's technological sovereignty at stake.

⁸⁹ An 'international European research organisation' means an international organisation, the majority of whose members are Member States or associated countries, whose principal objective is to promote scientific and technological cooperation in Europe.

Several research infrastructure and technology communities, such as the accelerator, light source, or astronomy communities, have already developed research infrastructure technology roadmaps that identify key components necessary to maintain Europe's leading position in research infrastructure technologies.

Projects should implement significant parts of, or entire existing research infrastructure technology roadmaps through co-creation with industrial partners from the earliest possible stage. The technology roadmaps should be the result of a community or cross-community effort already undertaken, and they should not be the result of an isolated effort, e.g., of a single research infrastructure. The technological solutions developed should respond to the needs of several research infrastructures, and in some cases the needs of different types of research infrastructures.

Proposals are expected to involve research infrastructures and industrial partners, including SMEs, or other technological partners, to promote innovation and knowledge sharing through co-creation of required technological solutions and, when appropriate, make use of large-scale platforms combining R&D, integration and validation for technological developments. While industry, including SMEs, or other technological partners do not need to be consortium members, proposals should show evidence of their commitment via engagement letters or other forms of endorsement. If applicable, proposals should describe how such partners will be identified in the course of the action.

Furthermore, proposals should contribute to fostering the innovation potential of research infrastructures by reinforcing the partnership with industry, through e.g. transfer of knowledge and other dissemination activities.

Proposals should address the following aspects as well:

- development of identified fundamental technologies or techniques underpinning and arising from the efficient and joint use of the involved research infrastructures, taking into account resource efficiency (e.g. raw material and energy consumption) and environmental (including climate-related) impacts.
- prototyping of high-performance methodologies, protocols, and instrumentation, including the testing of components, subsystems, materials, and dedicated software, needed to upgrade the involved research infrastructures, construct their next generation, or develop new advanced applications.

Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. Given the type of action (e.g. limited number of choices in specific technology fields) and its level of ambition, the maximum amount that can be granted to each third party may exceed the standard limit of EUR 60 000 if duly justified in the proposal.

Proposals may also include Pre-Commercial Procurement (PCP) subcontracting activities. This option encourages the use of public procurements for the competitive development of new specific solutions, whilst opening market opportunities for industry, including SMEs, and

researchers active in Europe. By establishing the procurement process in consecutive phases, the PCP activity can support the development of competing designs, prototypes, and solution testing. This ensures that investment risks do not prevent tackling specific scientific and technological issues and allows to approach a problem from different angles and to test different solutions.

When appropriate, proposals should also build on results from past/ongoing projects such as the ones funded under Horizon 2020 topics INFRAINNOV-03-2020 and INFRAINNOV-04-2020, and under Horizon Europe topics HORIZON-INFRA-2022-TECH-01-01 and HORIZON-INFRA-2024-TECH-01-01 and avoid overlap with them.

HORIZON-INFRA-2025-01-TECH-03: AI-powered impact simulations in support of the Destination Earth initiative

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 7.00 and 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>Subject to restrictions for the protection of European communication networks.</p> <p>The following additional eligibility criteria apply:</p> <p>If projects make use of weather and/or climate predictions or related data and services, beneficiaries should make use of the European Commission's Destination Earth initiative⁹⁰ and engage with the relevant community.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology</i>	Activities are expected to achieve TRL 7 or higher by the end of the

⁹⁰ See <https://destination-earth.eu/>. Access to the DestinE system can be requested through <https://platform.destine.eu/services/>

<i>Readiness Level</i>	project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁹¹.</p>

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Innovative use of AI, in line with the GenAI4Eu initiative⁹², and other key EU initiatives like the Apply AI strategy, to generate powerful local impact assessments on top of large-scale scenarios provided by digital twins demonstrated with fusion of real time data feeds, triggering available services and visualisations.
- Novel interfaces that translate the non-technical requirements of the users into concrete scenario assessments tailored for local needs.
- New best practices and guidelines on impact assessment of digital twin simulation and AI powered analysis are established.

Scope: Informed decision-making involves an increasing number of data sources, including high quality data from research infrastructures, and simulations. While the concept of Digital Twins in Earth Systems promises an increased interactivity for users to run various future impact scenarios, the complexity of such setups is challenging. Initiatives like Destination Earth (DestinE) have shown to generate massive data amounts that cannot be easily moved and therefore need to be processed on the RIs where they reside. AI solutions can help with complex data management activities but also benefit from the available data and compute resources, and combine them efficiently with required simulation services.

The proposals should cover all of the following aspects:

- Demonstrate the innovative use of AI, in line with the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy, to setup and manage impact assessments

⁹¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁹² This call falls under the ‘GenAI4EU’ initiative as in the Communication from the Commission to the European Parliament, the Council, the European Economic And Social Committee and the Committee of the Regions on boosting startups and innovation in trustworthy artificial intelligence ((COM(2024) 28 final of 24.1.2024).

assisted by simulation activities across RIs. They should ensure efficient selection of data and modelling resources and transparency for the consequent decision-making.

- Exploit the rapid advances in modelling, observations, digital technologies and ML/AI, ensuring that European leadership in this field is maintained;
- Link to existing DestinE Digital Twins and services to cover unexplored areas/domains and explore joining the overall DestinE ecosystem and service offering, addressing Union priorities and evolving end-user needs and create multi-disciplinary, horizontal, transversal infrastructure solutions to handle diverse end-to-end workflows spanning various areas.
- Allow for more informed decision-making by non-technical experts and policy makers through assistance of generative AI models enabling user requirements analysis and narrowing down vast amounts of data and information into actionable and understandable scenarios.
- Demonstrate trustworthiness/reliability in the use of AI and practice clear and open communication of AI use and impact to users.

Additionally, the proposals should also include work on some of the following points:

- Evolve further through science & technology innovation using AI, provide novel digital solutions and capabilities at operational level and accelerate science-technology synergies to achieve breakthroughs in the area of AI-powered Earth system science;
- Invest on the design of a robust development framework and respective pre-operational infrastructure for advanced AI/ML tools and applications, ensuring the quality, reliability, transparency and verifiability (repeatability) of the methods applied and outcomes that are created;
- Expand to new thematic areas and fields based on identified user needs and structured feedback provided by relevant stakeholders and communities.

Proposals are expected to cover various application areas and cover at least three distinct user groups and their impact assessments. The solutions need to demonstrate a sustainable setup answering day-to-day challenges but also be suitable for continuous long-term research. They should demonstrate how the compute capabilities and data on RIs can be made directly usable to users through interactivity with twins, adapting to changing data and on-demand visualisation capabilities.

Proposals should take advantage of the opportunities and developments offered by existing Horizon Europe research and innovation actions (RIA) and innovation actions (IA) developing new simulation and observation capabilities, new and emerging ICT infrastructures (e.g. EuroHPC, AI-on-Demand platform), HPC Centers of Competence and Excellence (such as ESiWACE for weather and climate prediction and ChEESE for solid Earth applications) and the work towards the European Digital Twin of the Ocean. The

proposals should demonstrate a clear and credible pathway towards collaboration with the implementing entities of Destination Earth initiative (European Space Agency (ESA), European Centre for Medium-Range Weather Forecasts (ECMWF) and European Organisation for the Exploitation of Meteorological Satellites (EUMETSAT)) and, when relevant, other key organisations in the field (e.g. Mercator Ocean).

HORIZON-INFRA-2025-01-TECH-04: AI-generated digital twins for science

Call: Research Infrastructures 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 8.00 and 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6 or higher by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁹³ .

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

⁹³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Innovative use of artificial intelligence (AI), in line with the GenAI4EU initiative⁹⁴, and other key EU initiatives, like the Apply AI strategy, is demonstrated to setup and manage highly complex modelling and simulation activities across different research infrastructures (RIs).
- New best practices and guidelines for model generation and setup, including simulation and simulation-observation data fusion, are established.
- Emergence of new applications and use cases, in line with the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy.

Scope: The aim is to use generative artificial intelligence (AI), in line with the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy, to deliver digital twins of complex real-world systems that advance the state-of-art of European research infrastructures and show transformative potential in their operations. The solutions should pave the way for new methods to conduct research by the RIs through AI generated and powered digital twins. They should propose suitable setups for creation of new digital twins or enhancing existing ones, already available within the scientific communities and relevant research infrastructures and for which an existing baseline on generative Artificial Intelligence models exists, the required data fusions, visualisations and execution of the workflows. The focus is on key impact sectors, such as healthcare (including mental health), transportation, agriculture, environment or manufacturing, or other fields related to the Clean Industrial Deal, in line with the European objectives seeking to leverage AI to address societal challenges, improve public services and drive inclusive economic growth. The proposed solutions, underpinning the provision of improved and advanced future services, should support RIs in new areas of research and/or a wider community of users, including clearly identified and relevant industrial, scientific or policy users and enhance the potential of the RIs in addressing EU's policy objectives and socio-economic challenges. The proposed solutions should, at least in part, be demonstrated in a relevant environment that can lead to sustainable production and include a cost estimate for the operations.

The proposed work is expected to benefit from recent advances in various AI areas, like Foundation Models (e.g. Large Language Models (LLMs)), Federated Learning and link to relevant European AI initiatives, such as the European AI factories⁹⁵, to demonstrate European capabilities to generate large on-demand impact simulations.

Proposals focusing on digital twins for decision-making in the area of the Earth systems and related socio-economic impacts will need to adhere to the standards and best practices set by

⁹⁴ This call falls under the 'GenAI4EU' initiative as in the Communication from the Commission to the European Parliament, the Council, the European Economic And Social Committee and the Committee of the Regions on boosting startups and innovation in trustworthy artificial intelligence ((COM(2024) 28 final of 24.1.2024).

⁹⁵ <https://digital-strategy.ec.europa.eu/en/policies/ai-factories>

the Destination Earth⁹⁶ initiative of the European Commission to allow coupling of new digital twins with the existing Destination Earth system.

The proposals should cover all of the following aspects:

- Demonstrate the ability to setup complex modelling and digital twin setups using generative AI in line with the GenAI4EU initiative and other key EU initiatives, like the Apply AI strategy.
- Ensure a data driven approach in which new simulations and Digital Twins are set up and demonstrate the chosen approach to work in at least three different application scenarios.
- Enable non-technical decision makers to express scenarios for challenges to be translated into impactful simulations, making use of existing digital twins, models and data sources.
- Demonstrate trustworthiness/reliability in the use of AI and practice clear and open communication of AI use and impact to users.

Additionally, the proposals should also include work on some of the following points:

- Best practices to use AI to generate digital twins and their setup.
- Contribute to the European AI Factories and their abilities to facilitate large scale AI setups.
- Demonstrate that proposed solutions work for at least two different scientific domains to highlight common principles and best practices in this approach.

Proposals should take advantage of the opportunities and developments offered by existing Horizon Europe research and innovation actions (RIA) developing new simulation and observation capabilities, the Horizon Europe CSA HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub, and new and emerging ICT infrastructures (e.g. EuroHPC and the AI-on-demand platform). Successful proposals in the energy-intensive industrial transition field will be encouraged to closely cooperate with the European Commission's Joint Research Centre (JRC) to foster coordination with on-going related activities.

⁹⁶ <https://digital-strategy.ec.europa.eu/en/policies/destination-earth>

Other Actions not subject to calls for proposals

Grants to Identified Beneficiaries

1. International Conference on Research Infrastructures – ICRI 2026

Expected outcome:

The project is expected to contribute to all the following outcomes:

- Contribution to address research infrastructure challenges with a global dimension;
- Increased capacity of the EU to respond, in cooperation with international players, to challenges at global level;
- Development of further cooperation with key international partners on research infrastructures;
- Enhanced role of the Union in international organisations and multilateral fora;
- Progress towards the development of global research infrastructures.

Scope:

The International Conference on Research Infrastructures (ICRI) is organised in an EU Member States or in a non-EU country, in cooperation with the European Commission. The next ICRI Conference is planned in the second semester 2026 in Italy.

ICRI 2026 will contribute to the objectives of the Research Infrastructures Work Programme. The specific objectives of the conference include:

- (1) to provide an international forum for the discussion on the development of global research infrastructures, in particular, on issues of common interest such as data sharing, digitisation of RIs, common standards, transnational access, the long-term sustainability of research infrastructures and their innovation potential;
- (2) to facilitate dialogue and strategic collaboration between European research infrastructures and their international counterparts;
- (3) to address the role of international research infrastructures collaboration in tackling global challenges and fostering the achievement of the UN Sustainable Development Goals;

This grant will be awarded without a call for proposals according to Article 198(e) of the Financial Regulation and Article 24(3)(b) of the Horizon Europe Regulation to the legal entities identified below, as they have been designated by the country hosting this event organised in cooperation with the Commission.

Specific conditions

Procedure: The evaluation committee will be fully composed of representatives of EU institutions.

Indicative timetable: Fourth quarter of 2025

Legal entities:

Responsible ministry or agency of Italy, or a legal entity designated by it. Consiglio Nazionale delle Ricerche, Piazzale Aldo Moro 7, 00185 Roma, Italy.

Form of Funding: Grants not subject to calls for proposals

Type of Action: Grant to identified beneficiary according to Financial Regulation Article 198(e) - Coordination and support action

The general conditions, including admissibility conditions, eligibility conditions, award criteria, evaluation and award procedure, legal and financial set-up for grants, financial and operational capacity and exclusion, and procedure are provided in parts A to G of the General Annexes.

Indicative budget: EUR 0.30 million from the 2025 budget

2. Danish Presidency conference on research infrastructures

Expected outcomes:

The conference will contribute to the following outcomes:

- Increased focus on infrastructures for research and innovation as strategic assets of the European Research Area.
- Contributions to streamlining priorities for European investments in the European landscape of research infrastructures, also considering the policy agenda on technology infrastructures.
- Maximising the exploitation of the innovation potential of complementary infrastructures for research and innovation in supporting EU priorities on, e.g. green and digital transitions, and in ensuring EU strategic autonomy and strengthened competitiveness and resilience.

Scope:

Taking stock of developments notably as regards the ERA Policy Agenda actions on research infrastructures and technology infrastructures, the event would explore their value for the achievement of key EU political objectives such as research and innovation for the green energy, circular materials and digital transition, and for strategic autonomy and a more competitive and resilient society and economy.

The event would also provide an opportunity to discuss upcoming priorities and activities on research infrastructures and technology infrastructures to maximise their impact, notably by fostering synergies and complementarities.

This grant will be awarded without a call for proposals, according to Article 198(e) of the Financial Regulation and Article 24(3)(b) of the Horizon Europe Regulation, to the legal entity identified below.

Specific conditions

Legal and financial set-up of the Grant Agreements:

The rules are described in General Annex G. The following exception apply:

- Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025)⁹⁷

Procedure: The evaluation committee will be fully composed by representatives of EU institutions.

Indicative timetable: Second quarter of 2025.

Legal entities:

Responsible ministry or agency of Denmark, or a legal entity designated by it.

Form of Funding: Grants not subject to calls for proposals

Type of Action: Grant to identified beneficiary according to Financial Regulation Article 198(e) - Coordination and support action

The general conditions, including admissibility conditions, eligibility conditions, award criteria, evaluation and award procedure, legal and financial set-up for grants, financial and operational capacity and exclusion, and procedure are provided in parts A to G of the General Annexes.

Indicative budget: EUR 0.15 million from the 2025 budget

3. Action to support Gazan researchers

The action will aim at developing an extensive mapping exercise to identify existing regional and local initiatives, potential beneficiaries (Gazan researchers, displaced or in-situ), and

⁹⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

stakeholders that could support Gazan researchers. This will be complemented by a pilot initiative to provide immediate support to an initial cohort of 50 Gazan researchers through a Virtual Research Collaboration Hub.

The hub will serve as a digital platform offering mentorship, collaboration opportunities, and access to academic resources. In parallel, engagement with European and international research networks will be fostered to start re-integrating Gazan researchers into the global scientific community.

Toward the end of the action, a feasibility assessment will be conducted to analyse insights from the overall mapping and stakeholder consultations. This assessment will provide firsthand perspectives on challenges, opportunities, and areas needing strategic intervention, culminating in an assessment report produced between months 16 and 18. The report will serve as base to orientate the design of a larger intervention.

Expected Outcomes: Project results are expected to contribute to all the following outcomes:

- Inventory of existing initiatives – A structured database of ongoing regional and local initiatives, identifying potential beneficiaries (Gazan researchers) and key stakeholders to serve as a reference for designing targeted interventions in the upcoming phases.
- Mapping of data-driven insights – A comprehensive analysis that helps prioritise research and innovation (R&I) cooperation areas requiring urgent attention, enabling a more informed allocation of resources to maximise impact.
- Recommendations for further engagement – A set of well-researched recommendations for refining engagement strategies, ensuring alignment with key priorities, and fostering more effective collaboration with stakeholders.
- First pilot action for 50 researchers in an existing Virtual Research Collaboration Hub. The access to the hub will be granted to researchers from Gaza to collaborate with peers globally. It will offer tools for joint research, data sharing, and remote access to international academic resources, such as journals and databases.
- A feasibility assessment report, will present insights derived from the overall mapping and stakeholder consultations and will serve as a foundational resource for designing a larger intervention.

Expected Impact:

Proposals should set out a credible pathway to contributing to all the following impacts:

- Continuity of research activities in Gaza and among displaced Gazan researchers.
- Strengthened international research collaborations involving Gaza's academic community.

Scope:

The mapping exercise will encompass a wide range of regional and local initiatives across multiple sectors, ensuring a holistic understanding of the engagement landscape. It will involve data collection from various available sources. The scope will also include stakeholder consultations to gain firsthand insights into challenges, opportunities, and areas requiring strategic intervention.

The action will serve as a foundation for future strategic planning by developing a dynamic and adaptable framework for continuous assessment. The findings will be utilised to refine policies, allocate resources more efficiently, and create collaborative networks that enhance the overall effectiveness of engagement and intervention efforts. Additionally, the action will identify the target groups necessary to extend the action in the next phase.

The pilot initiative to deliver immediate support to an initial group of 50 Gazan researchers through an existing virtual research collaboration hub could start in the last period of the mapping phase (month 12). The hub will act as a digital platform providing mentorship, collaborative research opportunities, and access to academic resources. At the same time, the initiative will strengthen connections with European and international research networks to facilitate the reintegration of Gazan researchers into the global scientific community.

The insights gained from this initial phase will help shape a more extensive intervention and a feasibility assessment report to be produced between months 16 and 18 will analyse key challenges, opportunities, and areas requiring strategic intervention to provide solid foundation for designing a larger intervention.

The Commission considers that a duration of 18 Months for this action would be appropriate.

This grant will be awarded without a call for proposals, according to Article 198(e) of the Financial Regulation and Article 24(3)(b) of the Horizon Europe Regulation, to the legal entity identified below.

Specific conditions

Legal and financial set-up of the Grant Agreements: The rules are described in General Annex G.

Procedure: The evaluation committee will be fully composed by representatives of EU institutions.

Legal entities:

UNIMED – Mediterranean Universities Union is a network of Higher Education and Research Institutions, active in promoting academic cooperation in the Euro-Mediterranean region and in Sub-Saharan Africa, in Middle East and in Western Balkans. UNIMED is a permanent stakeholder of the European Commission and the Union for the Mediterranean

Form of Funding: Grants not subject to calls for proposals

Type of Action: Grant to identified beneficiary according to Financial Regulation Article 198(e) - Coordination and support action

The general conditions, including admissibility conditions, eligibility conditions, award criteria, evaluation and award procedure, legal and financial set-up for grants, financial and operational capacity and exclusion, and procedure are provided in parts A to G of the General Annexes.

Indicative timetable: 2025-2026

Indicative budget: EUR 1.00 million from the 2025 budget

Public procurement

1. Support for EOSC EU Node Service Verification and Validation activities

Expected Outcome:

The requested personnel of the external service provider shall contribute to the evaluation and validation of the service components against the defined requirements and agreed roadmaps, verification and validation of the service, and system integration against defined industry standards and EOSC Platform specifications (upon which the EOSC EU Node has been built), examination of outputs produced by the implementation Contractor(s) as well as testing activities to confirm that system components are functional as designed.

The procurement will be using the existing TMII Framework Contract of DG DIGIT.

Scope:

In close collaboration with other Commission services and its customers, the Operating DG./Unit builds and operates solutions for a fully operational enabling infrastructure for EOSC – referred to as the EOSC EU Node – providing access to a rich portfolio of FAIR (Findable, Accessible, Interoperable, Reusable) data and professional quality interoperable services in all relevant domains from data handling to computing, processing, analysis and storing.

The main tasks for the external contractors are on one hand to support the Operating DG./Unit internally managing the service delivery, deployment and operations with special focus on the IT Governance process of the Commission and relevant policy and security compliance tasks, and on the other hand to monitor the third-party contractors directly, verifying and validating the services delivered against KPIs, SLR/SLA requirements (fit for use), as well as users' needs (fit for purpose).

Following EOSC specific tasks will be contributed by the personnel of the external service provider:

- Engage with the Operating DG./Unit, EC stakeholders and the EOSC EU Node Contractor(s) about opportunities to reuse existing solutions or services.

- Engage with the Operating DG/Unit concerning the IT Governance process and associated documents as “Project Charter”, “Architecture Canvas”, “Security Plan” etc. as per PM2 methodology.
- Continuous follow-up of EOSC EU Node Contractor(s)’ activities, SLRs, SLAs, milestones, and deliverables.
- Ensure the quality, efficiency, and effectiveness of EOSC EU Node services against requirements and EOSC's user community feedback.
- Check EOSC EU Node services through individual components and integration tests, including automatic testing of API end points, and performance and end-to-end testing (i.e., via online dashboard)
- Ensure EOSC EU Node’s capacity management is properly addressed:
 - o monitor capacity and performance data;
 - o investigate capacity issues.
- Ensure that a repository of architecture and deployment documentation of the environments rolled out by the three EOSC EU Node Contractor(s) is always available and properly maintained.
- Check services are available to users:
 - o analyse availability data;
 - o investigate service unavailability.
- Report back on user and community feedback.
- Liaise and organize coordination meetings with the Operating DG/Unit.
- Monitor and maintain live online dashboard for the Operating DG/Unit.
- Produce minimum quarterly service status reports for the Operating DG/Unit.

Following specific expertise is mandatory for the performance of tasks:

- There will be a collaborating relationship between the external contractor and the managed service providers of the EOSC EU Node (i.e., EOSC EU Node Contractor(s)), where both set of Contractor(s) add direct value to the overall service quality.
- The external contractor shall be able to assess the software tools proposed by the EOSC EU Node Contractor(s) to fulfil the functional and service level specifications of the procurement, as well as the cloud-based service delivery model (hosting and operations) requirement, for code quality, licensing, pre-existing IPR, service quality, and deployment, among others.

- The external contractor shall be able to apply state-of-the-art Software Audit Reviews & Software Quality Assessments based on industry standard maturity frameworks. Some notable service/software quality assurance standards include ISO 9000 family, Capability Maturity Model Integration, and Test Maturity Model integration.
- The external contractor shall be able to collect and summarize EOSC user community feedback (based on information provided by the EOSC EU Node services Contractor(s)) to assess the fitness of EOSC EU Node services to the users, and to assist future planning.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 1.00 million from the 2025 budget

Expert contract actions

1. External expertise 2025

This action will support:

1. The use of appointed independent experts for the evaluation and monitoring of actions (grant agreement, grant decision, public procurement actions, financial instruments, evaluation) funded under Horizon Europe and previous Framework Programmes for Research and Innovation and where appropriate, include ethics checks as well as compliance checks regarding the Gender Equality Plan eligibility criterion. A special allowance of EUR 450/day will be paid to the experts appointed in their personal capacity who act independently and in the public interest.
2. The use of individual experts to advise on, or support, the design and implementation of EU policies on research infrastructures. The activities carried out by the experts will be essential to the development and monitoring of the Union policy and initiatives in this area. The individual experts' tasks will include attending bilateral meetings with Commission services, remote drafting and possible preparatory work. The experts will be highly qualified, specialised, independent experts selected on the basis of their competence and knowledge of the field. A special allowance of EUR 450/day will be paid to the experts appointed in their personal capacity who act independently and in the public interest. This amount is considered to be proportionate to the specific tasks to be assigned to the experts, including the number of meetings to be attended and possible preparatory work.
3. The use of individual experts for the assessment of ERIC applications, as required under the ERIC Regulation⁹⁸. The experts will be highly qualified independent experts selected on the basis of their specific competence. The experts will provide a report for each of

⁹⁸ Council Regulation (EC) No 723/2009 of 25 June 2009 on the Community Legal Framework for a European Research Infrastructure Consortium.

the assessed ERIC application. A special allowance of EUR 450/day will be paid to the experts appointed in their personal capacity who act independently and in the public interest. This amount is considered to be proportionate to the specific tasks to be assigned to the experts.

4. The use of individual experts for the assessment of ESFRI Roadmap applications and the monitoring of ESFRI projects as part of the preparation of the ESFRI 2026 roadmap. The experts will be highly qualified independent experts selected on the basis of their specific competence. The experts will provide a report for each of the assessed ESFRI Roadmap application or ESFRI projects. A special allowance of EUR 450/day will be paid to the experts appointed in their personal capacity who act independently and in the public interest. The amount will be proportionate to the specific tasks to be assigned to the experts.

Form of Funding: Other budget implementation instruments

Type of Action: Expert contract action

Indicative budget: EUR 0.20 million from the 2025 budget

The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

Specific Features for Research Infrastructure

This section provides further conditions and requirements on access provision that applicants must comply with, for different topics under the INFRASERV destination of the Research Infrastructures work programme. Compliance with these provisions will also be taken into account during evaluation.

Trans-national and/or virtual access¹⁰⁰ activities.

Trans-national access activities

Trans-national access provision must be implemented as follows:

Trans-national access to infrastructure services offered under the grant is provided 'free of charge' to selected researchers or research teams (user-groups) including from industry. Access activities should be implemented in a coordinated way so as to improve the overall service provision to the research community. Access may be made available to external users, either **in person** ('hands-on'), when the user visits the infrastructure to make use of it, or through the provision to the user of **remote** scientific services, such as the provision of reference materials or samples, the remote access to a high-performance computing facility, the performance of sample analysis or sample deposition.

The research infrastructures must publicise widely the access offered under the grant agreement to ensure that researchers who might wish to have access to the infrastructures are made aware of the possibilities open to them. They must open specific calls to invite researchers to apply for access. The research infrastructures must promote equal opportunities in advertising the access and take into account gender issues when defining the support provided to visitors. They must maintain appropriate documentation to support and justify the amount of access reported. This documentation must include records of the names, nationalities, and home institutions of the users within the research teams, as well as the nature and quantity of access provided to them. To this extent, a unit of access to each infrastructure service/installation¹⁰¹ needs to be identified and precisely defined in the proposal.

The selection of researchers or research teams must be carried out through an independent peer-review evaluation of the research projects (user projects) they wish to carry out at the infrastructure. The research team, or its majority, must work in countries other than the country(ies) where the infrastructure is located (when the infrastructure is composed of several research facilities, operated by different legal entities, this condition must apply to each facility) except when access is provided by an International organisation, the Joint Research Centre (JRC), an ERIC or similar legal entities with international membership. User teams where all or the majority of users work in third countries can be supported as long as

¹⁰⁰ See Article 18 and Annex 5 of Horizon Europe Model Grant Agreement

¹⁰¹ "Installation" means a part or a service of a research infrastructure that can be used independently from the rest. A research infrastructure consists of one or more installations.

the cumulative access provided to them is below 20% of the total amount of units of access provided under the grant. In exceptional and well justified cases a higher percentage of access to third-country user teams can be set out in the proposal.

Only user groups that are allowed to disseminate the results they have generated under the action may be eligible for access (unless the users are working for SMEs).

The duration of stay at a research infrastructure must normally be limited to three months, unless otherwise provided for in the proposal.

The EU financial support to trans-national access will cover the *access costs*¹⁰² incurred by the access provider in providing access to the selected researchers, as well as the travel and subsistence costs incurred in supporting visits to the infrastructure of these researchers.

The *access costs* charged to the grant will not include capital investments (including depreciation costs of equipment, infrastructure or other assets) nor internally invoiced goods and services, unless otherwise specified in the work programme, while they may cover the running costs of the infrastructure as well as the cost for the logistical, technological and scientific support for users' access. This includes costs for ad-hoc training users need to use the infrastructure and for preparatory and closing activities that may be necessary to carry out users' work on the infrastructure.

Virtual access activities

Virtual access provision must be implemented as follows:

Virtual access to research infrastructure is provided through communication networks to users complying with the RI's access policy, without selecting them. Examples of virtual access activities are provision of access to databases available via Internet, or data deposition services.

The research infrastructures must publicise widely the access offered under the grant agreement to ensure that researchers who might wish to have access to the infrastructures are made aware of the possibilities open to them.

The EU financial support to virtual access will cover the *access costs*¹⁰³ incurred by the infrastructure in providing access under the project, including the technological and scientific

¹⁰² Access costs will be supported through the reimbursement of the eligible costs specifically incurred by a research infrastructure for providing access to the research teams selected for support under the project, or on the basis of unit costs calculated according to the methodology indicated in the [Decision](#) of 5 May 2022, authorising the use of unit costs for the costs of providing trans-national and virtual access in Research Infrastructures actions under the Horizon Europe Programme. In the latter case the access costs will be calculated multiplying the unit cost by the quantity of access provided under the grant. The cost of the unit of access to the infrastructure, i.e. the unit cost, must then be indicated in the proposal. A combination of the two methods mentioned above will also be possible.

¹⁰³ Access costs will be supported through the reimbursement of the eligible actual costs specifically incurred by a research infrastructure for providing virtual access to identified users under the project, or on the basis of unit costs calculated according to the methodology indicated in the [Decision](#) of 5 May 2022, authorising the use of unit costs for the costs of providing trans-national and virtual access in Research Infrastructures actions under the Horizon Europe Programme. In the latter case, the access

support researchers need to effectively use the services. Capital investments (including depreciation costs of equipment, infrastructure or other assets) as well as internally invoiced goods and services will not be eligible costs unless otherwise specified under the specific call or topic, in which case only the portion used to provide virtual access under the project can be eligible. A unit of access to each research infrastructure service must be identified and precisely defined in the proposal. The provision of virtual access during the project lifetime will be measured through the units of access defined in the grant agreement and must be periodically assessed by an external board. Eligibility criteria (e.g. affiliation to a research or academic institution) for users can be defined in the proposal, to take into account the access policies of the different RIs.

DRAFT

costs will be calculated multiplying the unit cost by the quantity of access provided under the grant. The cost of the unit of access to the research infrastructure, i.e. the unit cost, must then be indicated in the proposal. A combination of the two methods mentioned above will also be possible.

Horizon Europe
Work Programme 2025

4. Health

IMPORTANT NOTICE:

This draft has not been adopted or endorsed by the European Commission. Any views expressed are the views of the Commission services and may not in any circumstances be regarded as stating an official position of the Commission.

This draft is made public before the adoption of the work programme to provide potential participants with the currently expected main lines of this work programme. Only the adopted work programme will have legal value.

The adoption of the work programme will be announced on the Horizon Europe website and on the Funding and Tenders Portal.

Information and topic descriptions indicated in this draft may not appear in the final work programme; and likewise, new elements may be introduced at a later stage. Any information disclosed by any other party shall not be construed as having been endorsed by or affiliated to the Commission.

The Commission expressly disclaims liability for any future changes of the content of this document.

Introduction

Introduction

This work programme part is the first for the Health Cluster under Horizon Europe's new strategic plan for 2025-2027. It reflects a detailed review of the first four years of Horizon Europe (2021-2024), identifying funding gaps, emerging research needs and future challenges. It aligns with the European Commission's Political Guidelines for 2024-2029, focusing on strengthening healthcare resilience, leveraging biotechnology and artificial intelligence, and addressing public health needs including supporting the development of critical medicines. Research and innovation are key to achieving these goals, especially in healthcare.

As outlined in the Horizon Europe strategic plan, the main priorities of the Health Cluster from 2025 to 2027, are geared towards social cohesion, inclusion, and the overall health and wellbeing of Europeans, in line with the European Pillar of Social Rights. These priorities also emphasise the need to modernise healthcare systems and support an innovative, sustainable, and competitive health industry in Europe.

The EU's substantial pre-COVID-19 investments in infectious disease research enabled a swift response to the pandemic, including the development of vaccines. Building on this experience, the establishment of the European Health Emergency Preparedness and Response Authority (HERA) underscores the Commission's commitment to pandemic preparedness. The Health Cluster will continue to invest in this area, supporting the objectives of the European Health Union.

The public health impacts of climate change, pollution, and biodiversity loss (the triple planetary crisis) are increasingly evident. Research and Innovation investments are essential to understanding and mitigating these effects on human health and healthcare systems. This aligns with EU policies such as the European Green Deal and the EU Climate Adaptation Strategy. Additionally, the surge in mental health issues, exacerbated by the pandemic, climate crisis, and other stressors, highlights the need for further Research and Innovation investments in support of the Commission initiative on a comprehensive approach to mental health.

Further investments are necessary to address Europe's long-term challenges related to an ageing population and non-communicable diseases. The Health Cluster will contribute to initiatives such as “Healthier Together - EU Non-communicable Diseases Initiative” and the Cancer Mission, supporting the policy objectives of Europe’s Beating Cancer Plan.

Europe's healthcare systems, already strained by demographic changes and chronic conditions, face additional pressures from the energy crisis, inflation, and pandemic-related backlogs. The Health Cluster will explore ways to enhance the resilience of these systems, complementing the work of the European Partnership on Transforming Health and Care

Systems. This includes promoting greener practices, addressing health inequities, and leveraging digital transformation.

Further investments are also needed to leverage the innovation potential of health data and data-driven approaches. The proposed European Health Data Space (EHDS) Regulation will provide a framework for data-based health Research and Innovation activities, ensuring compliance with the EU's high data protection standards. Critical technologies such as Artificial Intelligence (AI) and biotechnology will be supported to secure EU technological sovereignty in the healthcare sector, in line with the EU "Artificial Intelligence Strategy" and the EU "Biotechnology and Biomanufacturing Strategy".

The Health Cluster work programme part for 2025 will take the first stride in addressing the needs and challenges identified in the strategic plan for 2025-2027 and support the objectives set by the European Commission's Political Guidelines for 2024-2029. It focuses on key areas such as the health impacts from pollution and environmental degradation, supporting policies like the European Green Deal and the Zero Pollution Action Plan. It will also address non-communicable diseases, mental health, pandemic preparedness, and antimicrobial resistance, which is a critical medicine area. This includes new treatment options, AI-based tools for pandemic response, and the European Partnership for Brain Health, as well as measures to improve the quality of life for individuals with intellectual disabilities. Furthermore, the programme aims to enhance healthcare efficiency, patient engagement, and trust in AI tools, in line with the European care strategy and the digital transformation of health and care in the EU. It will support biotechnology and AI to improve healthcare, including cellular and cell-free therapeutic approaches, generative AI models for biomedical research, and bridging the gap between pre-clinical and clinical development. Additionally, it will advance manufacturing processes for medical devices and Advanced Therapy Medicinal Products, supporting the EU Industrial Policy, ensuring the security of supply and resilience of the single market, fostering industrial competitiveness, and promoting sustainable practices. By aiming to improve regulatory processes and accelerate market access for innovative medicines, this work programme part also aligns with recommendations outlined in the Draghi report.

In March 2024, the Commission adopted the Strategic Technologies for Europe Platform (STEP) to boost investments in critical technologies in Europe: clean and resource efficient technologies, digital and deep innovation technologies and biotechnologies. STEP will mobilise funding from existing EU programmes to support the development and manufacturing of these critical technologies, while safeguarding and strengthening the respective value chains, as well as associated services and skills critical for and specific to the development and manufacturing of the final products. This work programme part identifies one action in support of STEP objectives, for which proposals meeting the minimum requirements indicated in the specific call conditions will receive a STEP seal¹ (See topic HORIZON-HLTH-2025-01-TOOL-05: "Boosting the translation of biotech research into innovative health therapies").

¹ https://strategic-technologies.europa.eu/about/step-seal_en

To realise the potential of new Research and Innovation for society, collaboration between research teams and prospective users of the knowledge and technology developed is paramount. It is therefore essential to involve these users - such as patients, healthy citizens, healthcare professionals, providers and payers, public health authorities, regulators, and innovators from academia and industry - early in the process of knowledge generation and technology development. This involvement can take the form of patient and citizen engagement, community involvement, and other social innovation approaches, ensuring that Research and Innovation activities align with the specific expectations, needs, constraints, and potential of users. Furthermore, effective intellectual property management strategies are crucial to maximise the benefits of such cooperation.

It is in the EU's strategic interest to cooperate with countries beyond the EU, particularly for multilateral cooperation on (global) health issues. This includes countries associated to Horizon Europe as well as other partner countries and regions worldwide. In line with the EU's Global Approach to Research and Innovation², participation in the Health Cluster of Horizon Europe is open to third countries. Supporting the Global Gateway Strategy³, projects involving international partners should aim to increase scientific knowledge and facilitate technology transfer among partner countries, addressing global health challenges and fostering sustainable growth and job creation. Such cooperation should be value-based, creating linkages rather than dependencies.

Applicants are encouraged to explore opportunities for synergies between the Health Cluster and other EU programmes⁴ to enhance the reach and impact of their projects, such as through broader stakeholder cooperation and follow-on activities. Synergies are in particular foreseen between the Health Cluster and the EU4Health programme to facilitate the uptake, further development and deployment of new knowledge and technologies in fields such as cancer, non-communicable diseases, mental health, pandemic preparedness and antimicrobial resistance, health systems and digital health. Synergies are also foreseen between the Health Cluster and the Digital Europe Programme to leverage Horizon Europe Research and Innovation results, such as deploying digital, privacy-preserving (distributed) data infrastructures, high-performance computing resources, and developing methods and tools for modeling complex phenomena related to human health.

The European Regional Development Fund (ERDF) -including Interreg- focuses, amongst others, on the development and strengthening of regional and local Research and Innovation ecosystems and smart economic transformation, in line with regional/national smart specialisation strategies. The programme can e.g., support investment in research infrastructure, activities for applied Research and Innovation, including industrial research,

² COM(2021) 252 final

³ JOIN(2021) 30 final

⁴ E.g., the EU4Health programme, the Digital Europe Programme, European Regional Development Fund (ERDF), including Interreg, European Social Fund (ESF+), Structural Reform Support Programme (SRSP), the Just Transition Fund (JTF), the European Maritime and Fisheries Fund (EMFF), the European Agricultural Fund for Rural Development (EAFRD), the European Defence Fund (EDF) or InvestEU.

experimental development and feasibility studies, building on Research and Innovation stemming from Horizon Europe⁵.

To further strengthen the impact of Research and Innovation efforts, Horizon Europe applicants could consider tapping into complementary activities offered by other relevant initiatives funded under the Horizon Europe programme. These include the innovation ecosystems and service provisions of the Knowledge and Innovation Communities (KICs) of the European Institute of Innovation and Technology (EIT), particularly EIT-KIC Health and EIT-KIC Digital, or the interregional networks funded under the European Innovation Ecosystems (EIE) component of Pillar III.

In addition, applicants to the Health Cluster are encouraged to explore opportunities for complementary topics and activities in other Clusters or parts of the Horizon Europe programme that address thematically similar challenges and areas of intervention. This can be in the Clusters of Pillar II, in the European Research Infrastructures work programme part (Pillar I), or in the European Innovation Council work programme (Pillar III). More specifically, beneficiaries of Horizon Europe grants are invited to consider possible collaborations and cross-fertilisation between their project and other projects selected under the same or other relevant calls.

The EU's Recovery and Resilience Facility (RRF) offers support to Member States in financing reforms and investments that improve their resilience and their growth potential, mitigate the economic and social impacts from the COVID-19 crisis, including in the area of health, and support the twin green and digital transitions. For project ideas that go beyond the remits of a Research and Innovation proposal and directly contribute to the objectives of the RRF it is advisable to check access to funding available at national level in line with the Member States' approved recovery and resilience plans for a fast and targeted support.

For topics in this Cluster, consortia could consider voluntarily contributing data, indicators, and knowledge to relevant Joint Research Centre (JRC) platforms. This would help capitalise on the knowledge developed in their projects and enhance their relevance to policymaking^{6, 7, 8, 9, 10, 11}.

In the context of the Health Cluster work programme part for 2025, FAIR data are data which meet the principles of findability, accessibility, interoperability, and reusability. Data may

¹¹ Health Promotion and Disease Prevention Knowledge Gateway Horizon Europe: https://knowledge4policy.ec.europa.eu/health-promotion-knowledge-gateway_en

include, amongst others, exploitation of information, digital research data generated in the action, data from European research infrastructures and programmes such as Copernicus, European Space Agency and the GEO initiative. For further details, see the FAIR principles website¹², the FAIR cookbook¹³ and the guides for researchers on how to make your data FAIR¹⁴.

Applicants to calls of the Health Cluster are encouraged to consider, where relevant, the services offered by current and future EU-funded European Research Infrastructures, including those prioritised by the European Strategy Forum on Research Infrastructures (ESFRI)¹⁵, European Research Infrastructure Consortia (ERICs)¹⁶ and the European Open Science Cloud¹⁷. Moreover, if projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, they must make use of European space technologies and services provided by Copernicus and/or Galileo/EGNOS (other data and services may additionally be used)¹⁸.

In the context of the Health Cluster work programme part for 2025, a clinical study covers clinical studies/trials/investigations/cohorts and is defined as any systematic prospective or retrospective collection and analysis of health data obtained from individual patients or healthy persons in order to address scientific questions related to the understanding, prevention, diagnosis, monitoring or treatment of a disease, mental illness, or physical condition. It includes but it is not limited to clinical studies as defined by Regulation 536/2014 (on medicinal products), clinical investigation and clinical evaluation as defined by Regulation 2017/745 (on medical devices), performance study and performance evaluation as defined by Regulation 2017/746 (on in vitro diagnostic medical devices).

Please note that the European Union (EU) pharmaceutical legislation known as the Clinical Trials Regulation No 536/2014¹⁹ entered into application on 31 January 2022, repealing the Clinical Trials Directive (EC) No. 2001/20/EC and national implementing legislation in the EU Member States, which regulated clinical trials in the EU until the Regulation's entry into application. As a result, from 31 January 2023, all initial clinical trial applications in the European Union (EU) must be submitted via the Clinical Trials Information System (CTIS)²⁰. CTIS is now the single-entry point for sponsors and regulators of clinical trials for the submission and assessment of clinical trial data.

The Horizon Europe strategic plan (2025-2027) sets out three Key Strategic Orientations (KSOs) for the last three years of the EU's framework programme for Research and Innovation, namely: KSO 1: "The Green Transition," aiming to support Europe in becoming the world's first climate-neutral continent by 2050, tackling biodiversity loss and pollution; KSO 2: "The Digital Transition," focusing on reinforcing Europe's competitiveness and strategic autonomy through research in core digital technologies; and KSO 3: "A More Resilient, Competitive, Inclusive, and Democratic Europe," aiming to bolster Europe's social rights and democratic values, ensuring they are globally promoted. This includes research in civil security, health and wellbeing, a fair economic model, and democratic participation.

The Health Cluster will support these KSOs by enhancing the understanding of climate change impacts on health, developing tools to protect against global health challenges, and reducing the sector's carbon footprint. It will promote technological and digital advancements to improve healthcare systems, focusing on disease prevention, personalised treatment, and equitable access to health services. Additionally, it will foster inclusive and resilient healthcare systems capable of responding to cross-border health threats and demographic changes, leveraging digital technologies such as AI to accelerate health research and improve health outcomes.

More specifically, the Health Cluster will support the KSOs by contributing to the six expected impacts set out for the Health Cluster in the strategic plan 2025-2027, which translate into the following six destinations of the Health Cluster work programme part for 2025:

Destination "Staying healthy in a rapidly changing society": The expected impact is that people of all ages in the EU stay healthy, resilient, and independent even as society changes fast. This will arise from healthier lifestyles and behaviour, healthier diets, healthier environments, improved evidence-informed health policies, and more effective solutions for health and wellbeing promotion, disease prevention and monitoring, and rehabilitation.

Destination "Living and working in a health-promoting environment": The expected impact is that people's living and working environments are health-promoting and sustainable thanks to a better understanding of the environmental, occupational, social, sex and gender-related, and economic determinants of health.

Destination "Tackling diseases and reducing disease burden": The expected impact is that healthcare providers improve their ability to tackle and manage diseases (infectious diseases, including poverty-related and neglected diseases, non-communicable and rare diseases) thereby reducing the disease burden on patients and enabling healthcare systems to perform more effectively. It can be achieved through better understanding, prevention, diagnostics, treatment, management, and cure of diseases and their co- and multi-morbidities, more effective and innovative health technologies and medical countermeasures, better ability and preparedness to manage pandemic and/or epidemic outbreaks, and improved patient safety.

Destination "Ensuring equal access to innovative, sustainable, and high-quality healthcare": The expected impact is that healthcare systems provide equal access to

innovative, sustainable and high-quality healthcare thanks to the development and uptake of safe, cost-effective and people-centred solutions. This is to be accompanied by management models focusing on population health, health systems resilience, and health equity and patient safety, and also improved evidence-informed health policies.

Destination “Developing and using new tools, technologies and digital solutions for a healthy society”: The expected impact is that health technologies, data, new tools, and digital solutions are applied effectively thanks to their inclusive, ethically sound, secure and sustainable delivery, integration and deployment in health policies and in health and care systems.

Destination “Maintaining an innovative, sustainable, and competitive EU health industry”: The expected impact is that the EU health industry is innovative, sustainable, and globally competitive thanks to improved uptake of breakthrough technologies and innovations (including social innovations) that make the EU with its Member States and Associated Countries more resilient and less reliant on imports of critical health technologies.

Calls

Call - Cluster 1 - Health (Single stage - 2025)

HORIZON-HLTH-2025-01

Overview of this call²¹

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ²²	Indicative number of projects expected to be funded
		2025		
Opening: 22 May 2025 Deadline(s): 16 Sep 2025				
Destination - Tackling diseases and reducing disease burden				
HORIZON-HLTH-2025-01-DISEASE-01: Testing safety and efficacy of phage therapy for the treatment of antibiotic-resistant bacterial infections	RIA	45.00	Around 15.00	3
HORIZON-HLTH-2025-01-DISEASE-03: Development of antibodies and antibody-derived proteins for the prevention and treatment of infectious diseases with epidemic potential	RIA	50.00	Around 10.00	5
HORIZON-HLTH-2025-01-DISEASE-04: Leveraging artificial intelligence for pandemic preparedness and response	RIA	35.00	6.00 to 8.00	5
HORIZON-HLTH-2025-01-DISEASE-05:	CSA	2.00	Around	1

²¹ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.
The Director-General responsible may delay the deadline(s) by up to two months.
All deadlines are at 17.00.00 Brussels local time.
The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

²² Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

Horizon Europe - Work Programme 2025
Health

Support for the functioning of the Global Research Collaboration for Infectious Disease Preparedness (GloPID-R)			2.00	
HORIZON-HLTH-2025-01-DISEASE-06: Implementation research addressing strategies to strengthen health systems for equitable high-quality care and health outcomes in the context of non-communicable diseases (GACD)	RIA	20.00	3.00 to 4.00	5
HORIZON-HLTH-2025-01-DISEASE-07: Tackling high-burden for patients and under-researched medical conditions	RIA	30.00	Around 6.00	5
Destination - Ensuring equal access to innovative, sustainable, and high-quality healthcare				
HORIZON-HLTH-2025-01-CARE-01: End user-driven application of Generative Artificial Intelligence models in healthcare (GenAI4EU)	RIA	40.00	15.00 to 20.00	2
Destination - Developing and using new tools, technologies and digital solutions for a healthy society				
HORIZON-HLTH-2025-01-TOOL-01: Enhancing cell therapies with genomic techniques	RIA	50.00	8.00 to 10.00	5
HORIZON-HLTH-2025-01-TOOL-02: Advancing cell secretome-based therapies	RIA	40.00	9.00 to 13.00	3
HORIZON-HLTH-2025-01-TOOL-03: Leveraging multimodal data to advance Generative Artificial Intelligence applicability in biomedical research (GenAI4EU)	RIA	50.00	15.00 to 17.00	3
HORIZON-HLTH-2025-01-TOOL-05: Boosting the translation of biotech research into innovative health therapies	RIA	80.00	4.00 to 8.00	10
Destination - Maintaining an innovative, sustainable, and competitive EU health industry				
HORIZON-HLTH-2025-01-IND-01: Optimising the manufacturing of Advanced Therapy Medicinal Products (ATMPs)	IA	40.00	6.00 to 8.00	5
HORIZON-HLTH-2025-01-IND-02: Digitalisation of conformity assessment procedures of medical devices and in vitro	CSA	4.00	Around 4.00	1

diagnostic medical devices				
Overall indicative budget		486.00		

General conditions relating to this call	
<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and exclusion</i>	The criteria are described in General Annex C.
<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

Call - Partnerships in Health (2025)

HORIZON-HLTH-2025-02

Overview of this call²³

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)			Expected EU contribution per project	Indicative number of projects
		2025	2026	2027		

²³ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.
The Director-General responsible may delay the deadline(s) by up to two months.
All deadlines are at 17.00.00 Brussels local time.
The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

Horizon Europe - Work Programme 2025
Health

					(EUR million) ²⁴	expected to be funded
Opening: 13 May 2025 Deadline(s): 03 Jun 2025						
Destination - Tackling diseases and reducing disease burden						
HORIZON-HLTH-2025-02-DISEASE-01: European Partnership for Brain Health	COFUND	56.50	46.50	47.00	Around 150.00	1
HORIZON-HLTH-2025-02-DISEASE-02: European partnership fostering a European Research Area (ERA) for health research (Phase 2)	COFUND	77.00			Around 77.00	1
Overall indicative budget		133.50	46.50	47.00		

General conditions relating to this call	
<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.

<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

²⁴ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

Call - Cluster 1 - Health (Two stage - 2025)

HORIZON-HLTH-2025-03-two-stage

Overview of this call²⁵

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ²⁶	Indicative number of projects expected to be funded
		2025		
Opening: 22 May 2025				
Deadline(s): 16 Sep 2025 (First Stage), 16 Apr 2026 (Second Stage)				
Destination - Staying healthy in a rapidly changing society				
HORIZON-HLTH-2025-03-STAYHLTH-01-two-stage: Improving the quality of life of persons with intellectual disabilities and their families	RIA	40.00	6.00 to 8.00	5
Destination - Living and working in a health-promoting environment				
HORIZON-HLTH-2025-03-ENVHLTH-01-two-stage: The impact of pollution on the development and progression of brain diseases and disorders	RIA	40.00	6.00 to 7.00	6
HORIZON-HLTH-2025-03-ENVHLTH-02-two-stage: Advancing knowledge on the impacts of micro- and nanoplastics on human health	RIA	40.00	7.00 to 8.00	5
Destination - Tackling diseases and reducing disease burden				

²⁵ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.
The Director-General responsible may delay the deadline(s) by up to two months.
All deadlines are at 17.00.00 Brussels local time.
The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

²⁶ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

Horizon Europe - Work Programme 2025
Health

HORIZON-HLTH-2025-03-DISEASE-02-two-stage: Advancing innovative interventions for mental, behavioural and neurodevelopmental disorders	RIA	50.00	6.00 to 8.00	7
Destination - Maintaining an innovative, sustainable, and competitive EU health industry				
HORIZON-HLTH-2025-03-IND-03-two-stage: Facilitating the conduct of multinational clinical studies of orphan devices and/or of highly innovative (“breakthrough”) devices	RIA	40.00	6.00 to 8.00	5
Overall indicative budget		210.00		

General conditions relating to this call	
<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and exclusion</i>	The criteria are described in General Annex C.
<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

Destinations

Destination - Staying healthy in a rapidly changing society

Topics under this destination are directed towards the Key Strategic Orientation 2 “*The Digital transition*” and Key Strategic Orientation “*A more resilient, competitive, inclusive, and democratic Europe*” of Horizon Europe’s strategic plan 2025-2027.

Research and Innovation supported under this destination should contribute to the following expected impact, set out in the strategic plan impact summary for the Health Cluster: “*people of all ages in the EU stay healthy, resilient, and independent even as society changes fast. This will arise from healthier lifestyles and behaviour, healthier diets, healthier environments, improved evidence-informed health policies, and more effective solutions for health and well-being promotion, disease prevention and monitoring, and rehabilitation*”.

People’s healthcare needs are different, depending on their age, stage of life, health status and socioeconomic background. Both physical and mental health are shaped not only by personal circumstances but also by the broader societal environment. In 2019, nearly 650,000 premature deaths across the EU²⁷ could have been prevented with effective primary prevention and public health measures targeting modifiable risk factors such as smoking, alcohol use and lack of physical activity. In addition, an estimated 135 million people in Europe live with a disability²⁸, highlighting the critical need for healthcare systems that are both accessible and adaptable. With population ageing and the rising prevalence of chronic conditions due to noncommunicable diseases and injuries, this number is set to increase in the future. Upbringing, income, education levels, social and gender aspects, and minority background play a critical role in shaping health risks as well as in prevention and management of disease. To leave no one behind, reduce health inequalities and support healthy and active lives for all, it is crucial to provide suitable, tailor-made solutions, including for people with specific needs. The prevention and early detection of diseases along with support and empowerment of citizens regarding their own health and wellbeing are at the core of successful public health programmes in the future.

Research and Innovation under this destination should help enhance the dialogue and coordination among stakeholders and policymakers, ensuring integration across different care settings to develop effective cross-sectoral solutions for holistic health promotion and disease prevention. Funded activities should seek to leverage the wealth of data sources, including real-world health data, to develop integrated and personalised health promotion and disease prevention strategies. These activities will benefit from emerging data resources such as the European Health Data Space (EHDS)²⁹ and European Open Science Cloud (EOSC)³⁰, and

²⁷ https://health.ec.europa.eu/document/download/3f9d55be-9e36-43d9-99ad-b96ac63a5b9b_en?filename=2022_healthatglance_rep_en_0.pdf

²⁸ <https://www.who.int/europe/news-room/fact-sheets/item/disability> The WHO European Region comprises 53 countries, covering a vast geographical region from the Atlantic to the Pacific oceans.

²⁹ https://health.ec.europa.eu/ehealth-digital-health-and-care/european-health-data-space_en

contribute to the European care strategy³¹ and the digital transformation of health and care in the EU³². During the first four years of Horizon Europe (2021-2024), this destination focused on urgent health issues such as obesity prevention, digital health literacy, understanding health-to-disease transitions, and using Artificial Intelligence (AI) to predict chronic disease risks. It also emphasised holistic disease prevention, healthy ageing, life course approaches to physical and mental health from early childhood, and personalised disease prevention.

In this work programme part, the emphasis will be on enhancing the quality of life, autonomy, and empowerment of individuals with intellectual disabilities and their families through innovative medical, technological, and digital solutions. This includes comprehensive and personalised approaches to health promotion, disease prevention, and integrated care. Importantly, this focus addresses habilitation and rehabilitation for disabilities, which have not yet been funded under the Horizon Europe Health Cluster. This aligns with the EU Strategy for the Rights of Persons with Disabilities 2021-2030 and supports Pillar 17 of the European Pillar of Social Rights, which aims to promote the inclusion of people with disabilities.

To increase the impact of EU investments under Horizon Europe, the European Commission encourages collaboration between EU-funded projects to foster synergies through networking, joint workshops, knowledge exchange, best practices, and joint communication activities. Synergies can be explored between projects funded under the same or different topics, Clusters or pillars of Horizon Europe. This includes collaborations between projects funded under Cluster 1 and Cluster 2 for complementary actions, such as promoting social inclusion, health equity (including gender equality and support for marginalised groups), and mental health initiatives in education, work, and daily life (including through culture and the arts).

Expected impacts:

Proposals for topics under this destination should set out a credible pathway to contributing to staying healthy in a rapidly changing society, and more specifically to one or several of the following impacts:

- Citizens adopt healthier lifestyles and behaviours, make healthier choices and maintain longer a healthy, independent and active life with a reduced disease burden, including at old ages or in other vulnerable stages of life.
- Citizens are empowered to effectively manage their physical and mental health and wellbeing, monitor their health status, and interact with healthcare providers to optimise their wellbeing throughout life.

³⁰ https://research-and-innovation.ec.europa.eu/strategy/strategy-2020-2024/our-digital-future/open-science/european-open-science-cloud-eosc_en

³¹ Communication from the European Commission on the European care strategy, COM(2022) 440, 7.9.2022

³² Communication from the European Commission on enabling the digital transformation of health and care in the Digital Single Market; empowering citizens and building a healthier society, COM(2018) 233, 25.4.2018

- Children and adolescents are empowered to better monitor and manage their physical, social and mental health with a view to lifelong healthy lifestyles.
- Society benefits from reduced economic and health burdens due to preventable illness and premature mortality, efficiency is increased by targeting scarce resources in appropriate, cost-effective ways, to areas of high social return, contributing to an improvement and optimisation of health and wellbeing of citizens and reduction of health inequalities.
- Citizens' trust in knowledge-based health interventions and in guidance from health authorities is strengthened, including through improved health literacy, resulting in increased engagement in and adherence to effective strategies for health promotion, disease prevention and treatment, while digital literacy inequalities are minimised.
- Health policies and actions for health promotion and disease prevention are knowledge-based, people-centred, personalised and thus targeted and tailored to citizens' needs, and designed to reduce health inequalities.

Proposals are invited against the following topic(s):

HORIZON-HLTH-2025-03-STAYHLTH-01-two-stage: Improving the quality of life of persons with intellectual disabilities and their families

Call: Cluster 1 - Health (Two stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants submitting a proposal under the blind evaluation pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the</p>

	<p>United States of America is eligible to receive Union funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>For the first stage, the thresholds for each criterion will be 4 (Excellence) and 4 (Impact). The overall threshold applying to the sum of the two individual scores will be set at a level that ensures the total requested budget of proposals admitted to stage 2 is as close as possible to four times the available budget, and not less than three and a half times the available budget.</p> <p>For the second stage, the thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ³³.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Staying healthy in a rapidly changing society”. To that end, proposals under this topic should aim to deliver results that are directed at, tailored towards and contributing to several of the following expected outcomes:

- Persons with intellectual disabilities and their families enjoy an improved quality of life, are empowered and have more independence through the support of innovative research.

³³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- The scientific community develops innovative solutions - medical, technological, digital or others - to reverse and/or reduce the severity level of the intellectual disability as soon as possible, especially in children, improving the health and autonomy of persons with intellectual disabilities and relieving their carers.
- Policymakers, health and care services, patient organisations, funders, the scientific community, and other relevant bodies are informed of the research advances and best practices addressing the health and needs of persons with intellectual disabilities and help reduce the impact of those disabilities on individuals, their families and society.

Scope: The scope of this topic is set by the definitions provided by ‘*The international classification of diseases*’ - World Health Organization (WHO) ICD11 under ‘6A00: Disorders of intellectual development’³⁴ and under ‘20: Developmental anomalies’³⁵ including disorders of intellectual development, such as ‘LD40: Complete trisomies of the autosomes’³⁶ and ‘LD90: Conditions with disorders of intellectual development as a relevant clinical feature’³⁷. Moreover, the three types of autism with disorders of intellectual development (6A02.1, 6A02.3 and 6A02.5) under ‘6A02: Autism spectrum disorder’³⁸ are also within the scope of this topic.

The focus of this topic is human-centred on the persons with long-term intellectual disabilities³⁹ and their formal and informal carers, including families. The life expectancy of persons with intellectual disabilities has increased in the last 20 years, which makes it even more important to analyse the role of their families acting as informal carers (e.g. ageing parents).

The objective of this topic is to explore new ways to improve the quality of life of persons with intellectual disabilities and their families and to reduce to the maximum possible the negative impact of the disability in their daily lives from different perspectives, such as medical, technological, digital or others. A key element to improve their quality of life is to prevent the worsening of the disability or conditions originating it. Thus, research needs to look from different perspectives into finding the causes of the disease(s) originating the disability and/or reducing as much as possible its level of severity.

³⁴ Disorders of intellectual development are a group of etiologically diverse conditions originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately two or more standard deviations below the mean (approximately less than the 2.3rd percentile), based on appropriately normed, individually administered standardised tests. Where appropriately normed and standardised tests are not available, diagnosis of disorders of intellectual development requires greater reliance on clinical judgment based on appropriate assessment of comparable behavioural indicators. See also

³⁶ <https://icd.who.int/browse/2024-01/mms/en#223744320>

³⁷ <https://icd.who.int/browse/2024-01/mms/en#948835301>

³⁸ <https://icd.who.int/browse/2024-01/mms/en#775270311>

³⁹ <https://icd.who.int/browse/2024-01/mms/en#437815624>

Persons with disabilities include those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others (Art. 1 of the Convention on the Rights of Persons with Disabilities - <https://www.ohchr.org/en/instruments-mechanisms/instruments/convention-rights-persons-disabilities>).

Innovative solutions are needed to provide novel medicines, diagnoses, treatments, protocols, technologies or digital solutions, etc. that can help in an early stage to prevent the worsening of the intellectual disability and/or related co-morbidities, reverse or reduce it, and to improve the autonomy of affected persons and relieve their carers.

Research actions under this topic should address several of the following areas:

- To properly diagnose as early as possible the disease(s) causing the intellectual disability or conditions worsening them, especially in the case of children, and paying attention to sex and gender-related differences and diagnostic biases.
- Deliver the necessary medical treatments, diagnoses, medicines, protocols, technologies, digital solutions, habilitation and/or rehabilitation services, etc. that can help preventing the worsening of the intellectual disability, reversing it or reducing its severity, while supporting the empowerment of the person with intellectual disabilities. Any health technology or medical intervention developed for human use must comply with the relevant regulatory requirements and be based on sound scientific evidence to ensure safety and efficacy.
- Tackle comorbidities or other disabilities that persons with intellectual disabilities may suffer from, with awareness of sex and gender-related differences.
- Provide evidence-based approaches for transitional care for young adults with intellectual disabilities, addressing also sex and gender-specific challenges and needs, the transition from paediatric to adult care being perceived as complex to navigate.
- Promote the empowerment among persons with intellectual disabilities and their caregivers, and whenever possible remove barriers persons with intellectual disabilities face for their participation in society. If applicable, with the support of assistive technologies and digital solutions, ensure optimal autonomy of persons with intellectual disabilities, facilitate and improve the treatment of persons with intellectual disabilities, and help also the family members and close carers to better support persons with intellectual disabilities. Such technologies must adhere to the relevant standards and be grounded in scientific evidence.
- Propose innovative solutions for high quality, accessible - including cognitively accessible - and affordable care services, to allow carers of persons with intellectual disabilities to better balance their work and family lives. The role of informal/unpaid carers, especially family members, is of key importance for persons with intellectual disabilities. For many persons with intellectual disabilities, the lack of care services and insufficient support for families and personal assistance undermines their quality of life and their rights and possibility to live as independently as possible.
- Develop innovative integrated care strategies - strengthening patient-centred care - to improve the Quality of Life of persons with intellectual disabilities of any age, and their families, paying special attention to persons with intellectual disabilities with the highest

vulnerability because of their high dependency on carers (formal and/or informal), multiple disabilities and need of adapted and special care (medical, social, educational and psychological dimensions).

- Develop guidelines in order to provide adequate support and training for caregivers, formal and informal, especially for those providing care for persons with intellectual disabilities and/or living with them, and also addressing the issue of prevention of and protection from violence since persons with intellectual disabilities are both vulnerable to violence and abuse and can be violent towards care givers and family members.

Applicants are encouraged to include patients, their families and carers in the different stages of the research. Likewise, it is encouraged to involve stakeholders from within and outside the intellectual disabilities sector, in particular policymakers and public authorities, citizens and civil society organisations, end-users and service providers.

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

All projects funded under this topic are encouraged to participate in networking and joint activities, as appropriate. These networking and joint activities could, for example, involve the participation in joint workshops, the exchange of knowledge, the development and adoption of best practices, or joint communication activities. Therefore, proposals are expected to include a budget for the attendance to regular joint meetings and may consider covering the costs of any other potential joint activities without the prerequisite to detail concrete joint activities at this stage. The details of these joint activities will be defined during the grant agreement preparation phase.

Projects are also encouraged to explore potential complementarities with projects funded under the Cluster 2 topic HORIZON-CL2-2025-01-TRANSFO-09: “Good practices for increased autonomy of persons with disabilities, including physical, mental, intellectual and sensory disabilities” are encouraged.

Applicants invited to the second stage and envisaging to include clinical studies⁴⁰ should provide details of their clinical studies in the dedicated annex using the template provided in the submission system.

⁴⁰ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

Destination - Living and working in a health-promoting environment

Topics under this destination are directed towards the Key Strategic Orientation 1 “*The Green transition*” and Key Strategic Orientation 3 “*A more resilient, competitive, inclusive, and democratic Europe*” of Horizon Europe’s strategic plan 2025-2027.

Research and innovation supported under this destination should contribute to the following expected impact, set out in the strategic plan impact summary for the Health Cluster: “*people's living and working environments are health-promoting and sustainable thanks to a better understanding of the environmental, occupational, social, sex and gender-related, and economic determinants of health*”.

The environment we live and work in is a major determinant of our health and wellbeing. The World Health Organization estimates that approximately 12.6 million deaths each year (24% of global deaths) are attributable to environmental risk factors and these factors are estimated to account for almost 20% of all deaths in Europe. Pollution in particular leads to more than 10% of annual premature deaths around the world. Environment-related disease burden also has significant economic effects. The environmental factors impacting on both physical and mental health and wellbeing are not well identified nor their effects comprehensively understood and accounted for to support evidence-based policy- and decision-making. Therefore, this destination aims at filling knowledge gaps in the understanding of the impacts on our health and wellbeing of those environmental, occupational and socio-economic risk factors that have the most significant or widespread societal impacts.

In this work programme part, Destination “*Living and working in a health-promoting environment*” focuses on the health impacts of exposures to pollution and environmental degradation in living and working environments. The results will support the EU’s environment and health policies and overarching policy frameworks such as the European Green Deal, the Chemical Strategy for Sustainability, the Zero Pollution Action Plan, the 8th Environment Action Programme, the EU Strategic Framework on Health and Safety at Work as well as the WHO European Environment and Health Process (EHP). Strong collaborations across sectors and with other Horizon Europe Clusters dealing with issues such as agriculture, food, environment, climate, biodiversity, mobility, security, urban planning, social inclusion and gender will be needed to ensure that maximal societal benefits are reached. In view of increasing the impact of EU investments under Horizon Europe, the European Commission welcomes and supports cooperation between EU-funded projects to enable cross-fertilisation and create synergies. This could range from networking to joint activities such as the participation in joint workshops, the exchange of knowledge, development and adoption of best practices, or joint communication activities. All topics are open to international collaboration to address global environment and health challenges.

Expected impacts:

Proposals for topics under this destination should set out a credible pathway to contributing to living and working in a health-promoting environment, and more specifically to one or several of the following impacts:

- Policy-makers and regulators are aware and well informed about environmental, socio-economic and occupational risk factors as well as health-promoting factors across society;
- Environmental, occupational, social, economic, and health policies and practices at the EU, national and regional level are sustainable and based on solid scientific evidence.
- The upstream determinants of health are known, understood and reduced;
- The health threats and burden resulting from hazardous chemicals and air, water and soil pollution and contamination are lessened, so that the related number of deaths and illnesses is substantially reduced;
- Living and working environments in European cities and regions are healthier, more inclusive, safer, resilient and sustainable;
- The adaptive capacity and resilience of populations and health systems in the EU to climate and environmental change-related to mental and physical health risks are strengthened;
- Citizens' health and wellbeing are protected and promoted, and premature deaths, diseases and inequalities related to environmental pollution and degradation are prevented;
- Citizens understand better complex environment and health issues, and effective measures to address them and support related policies and regulations.

Proposals are invited against the following topic(s):

HORIZON-HLTH-2025-03-ENVHLTH-01-two-stage: The impact of pollution on the development and progression of brain diseases and disorders

Call: Cluster 1 - Health (Two stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 7.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	The conditions are described in General Annex A. The following exceptions apply: Applicants submitting a proposal under the blind evaluation pilot (see

	<p>General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>ECHA ⁴¹ or other relevant decentralised EU agency (such as the European Environment Agency - EEA ⁴²) involved in the future Common Data Platform for Chemicals, may participate as member of the consortium selected for funding. Applicants may include in their proposals the possible contribution of the decentralised EU agency(ies) but the decentralised EU agency(ies) will not participate in the preparation and submission of the proposal. Applicants will indicate the contribution that the decentralised EU agency(ies) could bring to the project based on the scope of the topic text. After the evaluation process, the decentralised EU agency(ies) and the consortium selected for funding may come to an agreement on the specific terms of the participation of the decentralised EU agency(ies). If an agreement is found, the decentralised EU agency(ies) may participate in the grant agreement without any funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>For the first stage, the thresholds for each criterion will be 4 (Excellence) and 4 (Impact). The overall threshold applying to the sum of the two individual scores will be set at a level that ensures the total requested budget of proposals admitted to stage 2 is as close as possible to four times the available budget, and not less than three and a half times the available budget.</p> <p>For the second stage, the thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative</p>

⁴¹ European Chemicals Agency

⁴² European Environment Agency

	threshold will be 12.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ⁴³.</p> <p>In order to maximise synergies and increase the impact of the projects, all proposals selected for funding from this topic will form a cluster and be required to participate in common networking and joint activities (and in determining modalities for their implementation and the specific responsibilities of projects). These activities will be included in a dedicated work package, having sufficient budget allocated to it (around 2% of the total requested budget). Depending on the scope of proposals selected for funding, these activities may include:</p> <ul style="list-style-type: none">• Attendance of regular joint meetings (e.g., common kick-off meeting and annual meetings).• Periodic report of joint activities (delivered at each reporting period).• Common dissemination and communication activities (which may include, for example: a common dissemination and communication strategy, web portal and visual identity, brochure, newsletters).• Common Data Management Strategy and Common Policy Strategy (including joint policy briefs).• Thematic workshops/trainings on issues of common interest.• Working groups on topics of common interest (e.g. data management and exchange, communication and dissemination,

⁴³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

	science-policy link, scientific synergies).
--	---

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Living and working in a health-promoting environment”. To that end, proposals under this topic should aim to deliver results that are directed, tailored and contributing to most of the following expected outcomes:

- Global and EU policies preventing and reducing the health impacts of pollution are supported with up-to-date scientific evidence, tools and methodologies;
- Citizens are more protected by having a better insight into exposure to pollution and its impacts on brain health and adopting health enhancing behaviours;
- Public authorities, health stakeholders, the scientific community and the society at large have access to FAIR⁴⁴ data on the link between pollution and brain health, particular windows of susceptibility to exposure and the impacts of pollution on the general population and vulnerable groups;
- Public authorities develop adequate evidence-based measures and guidelines to prevent and reduce the negative impacts of pollution in the development of brain disease.

Scope: Life-long exposure to pollutants in the living and occupational environment is an important risk factor for non-communicable diseases, leading to a variety of serious physical and mental health impacts and causing preventable disease burden with associated elevated economic costs. Pollution disproportionately impacts certain vulnerable groups (e.g. children and older adults) or groups who are more sensitive or more exposed (workers, populations living in polluted areas) to this type of environmental stressor. At present, over 10% of annual premature deaths in the 27 EU Member States are related to environmental pollution⁴⁵.

Age is a major risk factor for neurodegenerative diseases, but environmental exposure and lifestyle are important candidates for understanding their aetiology. Accumulating evidence suggests that the “exposome”, described as the totality of human environmental exposures from pre-conception onwards, represents a major modifiable risk factor for most neurodegenerative diseases and dementia. Additionally, emerging evidence suggests that pollution, may contribute to the development of neurodegenerative disease, with increasing incidence in an ageing population.

The environment is known to be a significant determinant of child health, with increasing evidence that some industrial chemicals are toxic to the development of the human brain. The health impact of many potentially neurotoxic chemicals remains unstudied in human populations, including in children. The developing brain is particularly vulnerable to toxic chemical exposures and this sensitivity is likely greatest in utero and throughout early childhood.

⁴⁴ See definition of FAIR data in the introduction to this work programme part.

⁴⁵ <https://www.eea.europa.eu/en/topics/at-a-glance/state-of-europes-environment>

Chronic and repeated exposure to pollutants, in working environments but also for consumers, has also been associated with increased risk of cognitive impairment and neurodegeneration.

Research activities under this topic should explore evidence on the causal link between exposure to different pollutants (focusing on specific pollutants or a combination thereof) and the development or progression of neurological, neurodegenerative or neurodevelopmental diseases or disorders⁴⁶. Proposals can consider occupational, living and/or social environments and include one or more vulnerable, sensitive or exposed population groups. More specifically research actions under this topic should include several of the following activities while focusing either on neurological, neurodegenerative or neurodevelopmental diseases or disorders⁴⁷:

- Gain better insights on the pathogenesis and the molecular, genetic and epigenetic pathways and biological mechanisms involved in the onset and progression of disease, considering emerging pollutants, specific windows of susceptibility and adopting, when relevant, a life-course approach. Synergistic neurotoxic effects and realistic doses and duration of exposure should also be considered;
- Generate evidence on the impacts of pollution in comorbidities associated to neurodegenerative, neurological or neurodevelopmental diseases and disorders;
- Develop and/or validate better in-vivo, in-silico and in-vitro models, instruments and/or methods and take advantage (as applicable) of structural, functional and molecular imaging methods (e.g. MRI nuclear imaging), multi-omics and bioinformatics to study disease causation and evolution, considering, among others, also epigenetic factors and providing better biomarkers for early detection and disease progression;
- Apply the exposome framework to advance the understanding of the role of environment on neurodegenerative diseases research; elucidating the neuroexposome and emphasizing the brain's distinctive responses to environmental exposures;
- Contribute to the development of health indicators to inform mitigation and prevention measures, incorporating, when relevant, an intersectional approach that considers diverse individual characteristics such as sex, gender, age, ethnicity, and disability and socioeconomic and lifestyle factors;
- Strengthen the understanding of the possible causative link between exposure and incidence of disease by taking advantage of well-designed longitudinal studies (considering exposure duration and differences in exposure composition, geographical location and sources), rigorously controlled epidemiologic studies and/or clinical, real-

⁴⁶ For guidance on the diseases and disorders under scope of this topic please consult ICD-11 for Mortality and Morbidity Statistics (who.int): <https://icd.who.int/browse/2024-01/mms/en#1516623224> Chapters 6 and 8 specifically on neurodevelopmental disorders and neurocognitive disorders (including accelerated cognitive decline and chronic pain conditions).

⁴⁷ For each of the three focus areas, proposals can address one or several diseases or disorders as relevant for the research action proposed.

world and/or cohort data (building on existing national and international cohorts when available);

- Generate evidence on the potential association between the accumulated long-term exposure of workers and consumers to pollutants (including low-level exposure) and neurological and neurodegenerative diseases. The development of neurodevelopmental disorders in children following parental exposure could also be evaluated.

Gender and sex-related differences should be addressed, where appropriate.

Applicants are encouraged to consider the use of experimental methods not using live animals, where relevant and allowing to obtain data of comparable validity.

Proposals should adhere to the FAIR⁴⁸ data principles and adopt wherever relevant, data standards and data sharing/access good practices.

The effect of nutrition on mental health should not be the main focus since this area will be covered by topic HORIZON-CL6-2025-02-FARM2FORK-12: “Nutrition and Mental Health”.

Applicants should be acquainted with the activities being developed under the Environment, climate and health research portfolio⁴⁹, the EFSA activities under Environmental Neurotoxics⁵⁰ and Developmental neurotoxicity⁵¹ and the Partnership for the Assessment of Risks from Chemicals - PARC⁵².

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

Proposals should take advantage of and connect to European research infrastructures and services in the area of environmental exposure assessment.

Proposals should ensure that chemical monitoring including human biomonitoring data are shared in the Information Platform for Chemical Monitoring (IPCHEM)⁵³ through involvement with the European Commission's Joint Research Centre (JRC), and/or in the future Common Data Platform for Chemicals, through involvement with the European Chemicals Agency (ECHA)⁵⁴ or other relevant decentralised EU agency (such as the European Environment Agency - EEA⁵⁵) responsible for the specific domain. In that respect, the JRC, ECHA or other relevant decentralised EU agency(ies) should collaborate with any

Depending on the scope of proposals selected for funding, these activities may include:</p> <ul style="list-style-type: none">• Attendance of regular joint meetings (e.g., common kick-off meeting and annual meetings).• Periodic report of joint activities (delivered at each reporting period).• Common dissemination and communication activities (which may include, for example: a common dissemination and communication strategy, web portal and visual identity, brochure, newsletters).• Common Data Management Strategy and Common Policy Strategy (including joint policy briefs).• Thematic workshops/trainings on issues of common interest.• Working groups on topics of common interest (e.g. data management and exchange, communication and dissemination, science-policy link, scientific synergies).
-----------------------------	---

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Living and working in a health-promoting environment”. To that end, proposals under this topic should aim to deliver results that are directed, tailored and contributing to most of the following expected outcomes:

⁶⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Environmental and health policies reducing exposure to micro- and nanoplastics and preventing their potential health impacts are supported with up-to-date scientific evidence, standards, tools and methodologies;
- Public authorities and the scientific community have access to FAIR⁶¹ data on realistic human exposures to micro- and nanoplastics and their potential impacts on human health based on real-world scenarios across living and working environments;
- Citizens are informed about the impacts of exposure to micro- and nanoplastics on health and adopt behaviours protecting health and reducing human impacts on the environment;
- Industry is supported in the assessment of products' safety and sustainability;
- Existing major knowledge gaps in the understanding of the health impacts of exposure to micro- and nanoplastics are filled and mitigation measures based on robust evidence are promoted;
- Public authorities and regulators are supported with evidence-based guidance to design health policies.

Scope: Plastics are an important material in our economy that are everywhere in our daily lives but can present negative environmental and health impacts. A significant amount of plastic ends up in the environment, degrading into micro- or nano-sized plastic particles that are defined as micro- or nanoplastics (MNPs). MNPs can be detected in both marine and terrestrial ecosystems worldwide in food, water, air and consumer products. These MNPs have been documented to accumulate in the human body into cells and tissues (e.g. liver, kidney, gastrointestinal track, placenta, testicles) and cause associated adverse biological effects (e.g. inflammatory response, geno-, cyto-, neuro- and nephron-, respiratory and reproductive toxicity). Exposure routes for MNPs into the human body can be through inhalation, ingestion and dermal contact and translocation of nanoplastics and small microplastics through tissues and organs can occur. Furthermore, it has been documented that MNPs can cause additional harm by releasing specific chemical additives with potentially negative health impacts. However, because microplastics are an emerging contaminant and research on the causality between exposure to MNPs and health impacts is still at a relatively early stage, the evidence on the health risks of exposure to MNPs is scattered and numerous knowledge gaps still persist.

Research activities under this topic should strengthen the evidence on the impacts of micro- and nanoplastics exposure on human health, considering living and working environments and different exposure routes (inhalation, ingestion and dermal exposure). Proposals should focus on realistic concentrations of tested particles and exposures to a variety of sizes, shapes and chemical compositions of MNPs materials and advance in the comparability between studies. Moreover, research activities should take into account recent policy developments,

⁶¹ See definition of FAIR data in the introduction to this work programme part.

support relevant policy gaps and needs and support the work on standardisation of analytical methods.

More specifically, research actions under this topic should include several of the following activities:

- Increase comparability and reproducibility between studies by means of a better optimisation, validation and standardisation of the analytical methods, protocols and methodologies to collect MNPs in the environment and detect and quantify the exposure in the human body and in the environment;
- Study the causal mechanisms of action and pathways involved on molecular, cellular and organism level effects from exposure to MNPs;
- Improve the understanding of the drivers of toxicity and other adverse health effects of MNPs, using realistic environmental samples and considering varying sizes, shapes, concentrations and chemical compositions, and interaction with components in the environment;
- Develop suitable and (environmentally) relevant reference materials that can be used to improve robustness and comparability across laboratories;
- Develop better in-vivo, in-silico and in-vitro models, instruments and methods for risk and hazard assessment harmonised across various types of MNPs. These include long-term exposure and monitoring models, mimicking real-world scenarios and dosimetry and observational studies on humans and development of strategies to integrate experimental and in-silico data;
- Strengthen the existing knowledge on human exposure to micro- and nanoplastics through the development of human biomonitoring studies and the use of specific biomarkers and endpoints;
- Generate evidence on the long-term impacts of MNPs on human health, MNPs' fate and systemic effects through well-designed and robust systematic studies;
- Provide robust evidence on the exposures to MNPs at work: identify environments with highest concentrations and focus on improving approaches for assessment, prevention and mitigation of occupational exposures;
- Increase the understanding of the environmental routes of exposure to MNPs, considering real-life exposure routes;
- Propose mitigation measures to reduce population exposure to MNPs including collecting evidence on the health impacts of potential alternative materials developed to replace plastics;

- Gain better insights on the interactions between MNPs (and their additives) with other pollutants and/or biological agents and the combined impacts of these interactions on human health (considering also the understanding of individual toxicity effects);
- Gain better insights on the delivery mechanisms and study the elimination process of MNPs in the human body and the microbiome capacity to degrade (or accelerate degradation of) ingested MNPs;
- Promote exchange of knowledge and experiences across MS and policies and engage with regulators and public authorities to ensure suitability and further uptake of relevant results.

Gender and sex related differences should be addressed, where appropriate.

Applicants are encouraged to consider the use of experimental methods not using live animals, where relevant and allowing to obtain data of comparable validity.

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities. Proposals should adhere to the FAIR⁶² data principles and adopt wherever relevant, data standards and data sharing/access good practices.

Proposals could consider the involvement of the European Commission's Joint Research Centre (JRC) with respect to the value it could bring in providing an effective interface between research activities and regulatory aspects and/or in translating research results into harmonised test methods and strategies fit for regulatory purpose. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

Proposals should also ensure that chemical monitoring including human biomonitoring data are shared in the Information Platform for Chemical Monitoring (IPCHEM)⁶³ through involvement with the European Commission's Joint Research Centre (JRC), and/or in the future Common Data Platform for Chemicals, through involvement with the European Chemicals Agency (ECHA)⁶⁴ or other relevant decentralised EU agency (such as the European Environment Agency - EEA⁶⁵) responsible for the specific domain. In that respect, the JRC, ECHA or other relevant decentralised EU agency(ies) should collaborate with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

In order to maximise synergies and increase the impact of the projects, all proposals selected for funding from this topic will form a cluster and be required to participate in common networking and joint activities. Without the prerequisite to detail concrete joint activities,

⁶² See definition of FAIR data in the introduction to this work programme part.

⁶³ <https://ipchem.jrc.ec.europa.eu>

⁶⁴ <https://echa.europa.eu>

⁶⁵ <https://www.eea.europa.eu>

proposals should allocate a sufficient budget for the attendance of regular joint meetings and to cover the costs of any other potential common networking and joint activities. Guidance on the potential activities to be developed can be obtained by consulting the clusters of projects ongoing under the Environment, climate and health portfolio⁶⁶.

Applicants invited to the second stage should provide details of their clinical studies⁶⁷ in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

⁶⁶ https://research-and-innovation.ec.europa.eu/research-area/health/environment-and-health_en

⁶⁷ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

Destination - Tackling diseases and reducing disease burden

Topics under this destination are directed towards the Key Strategic Orientation 3 “*A more resilient, competitive, inclusive, and democratic Europe*” of Horizon Europe’s strategic plan 2025-2027.

Research and Innovation supported under this destination should contribute to the following expected impact, set out in the strategic plan impact summary for the Health Cluster: “*healthcare providers improve their ability to tackle and manage diseases (infectious diseases, including poverty-related and neglected diseases, non-communicable and rare diseases) thereby reducing the disease burden on patients and enabling healthcare systems to perform more effectively. It can be achieved through better understanding, prevention, diagnostics, treatment, management, and cure of diseases and their co- and multi-morbidities, more effective and innovative health technologies and medical countermeasures, better ability and preparedness to manage pandemic and/or epidemic outbreaks, and improved patient safety*”.

Communicable and non-communicable diseases cause the greatest amounts of premature death and disabilities and pose a major health, societal and economic threat and burden in the EU and worldwide. Many people are still suffering from these diseases and too often dying prematurely. Although many of these diseases are preventable to a large extent, only around 6% of the healthcare budgets are currently spent on preventive measures⁶⁸. Therefore, there is the urgent need to develop new public health interventions, preventive, diagnostic and therapeutic approaches, alternatives to antimicrobials, as well as to improve existing preparedness and response strategies to create tangible impacts, taking into account sex/gender-related issues. In this regard, Research and Innovation will require international cooperation to pool the best expertise and know-how available worldwide, to access world-class research infrastructures and to leverage critical scales of investments on priority needs through a better alignment with other funders of international cooperation in health Research and Innovation. The continuation of international partnerships and cooperation with international organisations is particularly needed to combat infectious diseases, to address brain health, to respond to public health needs, including the global burden of non-communicable diseases.

In this work programme part, Destination “*Tackling diseases and reducing disease burden*” will focus on major societal challenges linked to the Commission’s political priorities such as the fight against non-communicable and communicable diseases, mental health and better treatment of mental, behavioural and neurodevelopmental diseases, preparedness and response to and surveillance of health threats and epidemics, reduction and treatment of the number of antimicrobial-resistant infections. In particular, the topics under this destination will support activities aiming at: i) new effective treatment options for patients suffering from

⁶⁸ Preventive healthcare expenditure as a share of the current expenditure on healthcare [https://ec.europa.eu/eurostat/statistics-explained/index.php?title=File:Preventive healthcare expenditure as a share of current expenditure on healthcare, 2021 \(%25\) HCE2024.png](https://ec.europa.eu/eurostat/statistics-explained/index.php?title=File:Preventive_healthcare_expenditure_as_a_share_of_current_expenditure_on_healthcare,_2021_(%25)_HCE2024.png)

antimicrobial resistant (AMR) infections; ii) innovative therapeutic interventions and complementary approaches for patients suffering from mental, behavioural and neurodevelopmental disorders; iii) new prevention and treatment options for infectious diseases with epidemic potential; iv) Artificial Intelligence (AI) based tools and technologies for pandemic preparedness and response; v) implementation research on strengthening health systems in the context of non-communicable diseases; vi) supporting the Global Research Collaboration for Infectious Disease Preparedness; vii) setting up the European Partnership for Brain Health; and viii) supporting efforts of the European Partnership fostering a European Research Area for health research (ERA4Health)⁶⁹ in particular in funding large-scale multi-country Investigator-Initiated Clinical Studies (IICS) on various health interventions addressing important public health needs.

In view of increasing the impact of EU investments under Horizon Europe, the European Commission welcomes and supports cooperation between EU-funded projects to enable cross-fertilisation and other synergies. This could range from networking to joint activities such as the participation in joint workshops, the exchange of knowledge, the development and adoption of best practices, or joint communication activities. Opportunities for potential synergies exist between projects funded under the same topic but also between other projects funded under another topic, Cluster or pillar of Horizon Europe (but also with ongoing projects funded under Horizon 2020). In particular, this could involve projects related to European health research infrastructures (under pillar I of Horizon Europe), the EIC strategic challenges on health and EIT-KIC Health (under pillar III of Horizon Europe), or in areas cutting across the health and other Clusters (under pillar II of Horizon Europe). For instance, with Cluster 3 “*Civil security for society*” such as on health security/emergencies (preparedness and response, medical countermeasures, epidemic outbreaks/pandemics, natural disasters and technological incidents, bioterrorism); with Cluster 4 “*Digital, Industry and Space*” such as on AI-based tools and technologies (e.g. detection, management and monitoring of an epidemic at population levels, and the diagnosis, treatment, and prevention at the level of individuals); or with Cluster 6 “*Food, bioeconomy, natural resources, agriculture and environment*” such as on antimicrobial resistance - AMR (e.g. new effective treatment options, alternatives to antibiotics).

Some Research and Innovation actions under this destination should support the mission of the European Health Emergency and Response Authority (HERA) to strengthen Europe’s ability to prevent, detect, and rapidly respond to cross-border health emergencies by ensuring the availability and access to key medical countermeasures. Furthermore, synergies will be sought between this destination and the implementation of the EU4Health Programme (2021-2027)⁷⁰. These synergies and complementarities could be achieved, notably through mechanisms based on feedback loops, enabling on the one hand to identify policy needs that should be prioritised in Research and Innovation actions and facilitating on the other hand the

⁶⁹ <https://era4health.eu>

⁷⁰ https://health.ec.europa.eu/funding/eu4health-programme-2021-2027-vision-healthier-european-union_en

implementation of research results into policy actions and clinical practice, thereby providing an integrated response across sectors and policy fields.

Expected impacts:

Proposals for topics under this destination should set out a credible pathway to contributing to tackling diseases and reducing disease burden, and more specifically to several of the following impacts:

- Disease burden in the EU and worldwide is reduced through effective disease management, including through the development and integration of innovative preventive, diagnostic and therapeutic approaches, digital and other people-centred solutions for healthcare.
- Premature mortality from non-communicable diseases is reduced by one third (by 2030), mental health and wellbeing are promoted, and the voluntary targets of the WHO Global Action Plan for the Prevention and Control of NCDs⁷¹ 2013-2020 are attained (by 2025), with an immediate impact on the related disease burden (Disability-Adjusted Life Years - DALYs)^{72,73,74}.
- Healthcare systems benefit from strengthened Research and Innovation expertise, human capacities and know-how for combatting communicable and non-communicable diseases, including through international cooperation.
- Citizens benefit from reduced (cross-border) health threat of epidemics and AMR pathogens, in the EU and worldwide^{75,76}.
- Patients and citizens are knowledgeable of disease threats, involved and empowered to make and shape decisions for their health, and better adhere to knowledge-based disease management strategies and policies (especially for controlling outbreaks and emergencies).

The protection of European communication networks has been identified as an important security interest of the Union and its Member States. Entities that are assessed as high-risk suppliers⁷⁷ of mobile network communication equipment (and any entities they own or

⁷¹ Non-communicable diseases

⁷² <https://www.who.int/publications/i/item/9789241506236>

⁷³ Including for instance the following voluntary targets (against the 2010 baseline): A 25% relative reduction in the overall mortality from cardiovascular diseases, cancer, diabetes, or chronic respiratory diseases; Halt the rise in diabetes and obesity; An 80% availability of the affordable basic technologies and essential medicines, including generics, required to treat major non-communicable diseases in both public and private facilities.

⁷⁴ Disability-adjusted life year (DALY) is a quantitative indicator of overall disease burden, expressed as the number of years lost due to ill-health, disability or early death.

⁷⁵ WHO global action plan on antimicrobial resistance, 2015

⁷⁶ EU One Health Action Plan against AMR, 2017

⁷⁷ Entities assessed as “high-risk suppliers”, are currently set out in the second report on Member States’ progress in implementing the EU toolbox on 5G cybersecurity of 2023 (NIS Cooperation Group, Second report on Member States’ progress in implementing the EU Toolbox on 5G Cybersecurity, June 2023) and the related Communication on the implementation of the 5G cybersecurity toolbox of 2023

control) are not eligible to participate as beneficiaries, affiliated entities and associated partners to topics identified as “subject to restrictions for the protection of European communication networks”. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

Proposals are invited against the following topic(s):

HORIZON-HLTH-2025-01-DISEASE-01: Testing safety and efficacy of phage therapy for the treatment of antibiotic-resistant bacterial infections

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 15.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 45.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health’s programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Legal and financial set-up of the Grant</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the</p>

(Communication from the Commission: Implementation of the 5G cybersecurity Toolbox, Brussels, 15.6.2023 C(2023) 4049 final).

<i>Agreements</i>	Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ⁷⁸ .
-------------------	---

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to most of the following expected outcomes:

- Researchers and developers make the best use of the state-of-the-art knowledge and resources for an effective development of new treatment options for patients suffering from difficult-to-treat infections.
- Healthcare professionals and people living with difficult-to-treat infections are ultimately provided with the availability of clinically useful phage therapies.
- Regulators are provided with quantifiable, verifiable and replicable data on safety and efficacy of phage therapy for human use and move faster towards market approval of novel phage-based therapies against antimicrobial resistant infections.
- Citizens are engaged and informed on innovative phage-based treatments as alternative therapeutic options complementary to antibiotics.

Scope: Antimicrobial resistance (AMR) has been identified by the United Nations (UN) General Assembly as a health Emergency in 2016. AMR is contributing to morbidity and mortality increasing the burden for society and healthcare costs. This is due to a worrying increase on the number of bacteria resistant to antibiotic treatment, causing chronic and often life-threatening infections such as wound and urinary tract infections. The World Health Organization (WHO) lists AMR among the top 10 threats for global health⁷⁹ and recognises that a lack of innovation is set to undermine antibiotic performance and health gains, with a major gap in the discovery of innovative antibacterial treatments⁸⁰.

Hence, there is an urgent need for the development of therapies to treat infections.

Bacteriophages (phages) represent a promising alternative or complement to antibiotics for the treatment of infections that do not respond to conventional treatment options. With the increase of AMR bacteria, both healthcare practitioners and innovators are expressing an increasing interest in the use of phages for the treatment of infections. As a result, the clinical

⁷⁸ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁷⁹ <https://www.who.int/news-room/fact-sheets/detail/antimicrobial-resistance>

⁸⁰ <https://www.who.int/news/item/22-06-2022-lack-of-innovation-set-to-undermine-antibiotic-performance-and-health-gains>

use of phage therapy is expanding in the EU and beyond under different regulatory pathways, approaches and different conditions (e.g. magistral personalised phage preparations and fixed phage cocktails applied via compassionate use, named-patients based or expanded access programmes) despite a lack of large data on the efficacy of phage therapy for human use. So far, a few modest-sized randomised-controlled trials have been conducted providing indications for the safety and efficacy of the phage products, in agreement with preclinical animal studies. However, they could not always prove the efficacy of phage preparations.

Therefore, proposals should aim to develop phage-based therapies to treat bacterial infections that do not respond to conventional treatment options. For this, applicants should carry out multicenter, multinational randomised controlled clinical trial (RCT) to generate scientific evidence demonstrating safety and efficacy of phage-based therapy as stand-alone or in combination with standard-of-care (such as antibiotic or other innovative non-antibiotic-based treatment) for the treatment of difficult-to-treat bacterial infections.

Both approaches for phage therapy, personalised phage preparations or ready-to-use phage cocktails, are in scope with the call. Innovative study design, aiming at better capturing and evaluating the full potential of the benefit of personalised phage therapy, e.g. using regularly updated phage preparations, is welcome.

The topic is open to any pathogen causing difficult to treat infections mainly due to AMR or to biofilms, for any clinical indication and applying phage treatment in any route of administration. Applicants are encouraged to address pathogens listed in the WHO Bacterial Priority Pathogens List⁸¹.

Lessons learned from previous clinical trials that failed⁸² (e.g. PhagoBurn) should be considered for optimal study design, e.g. inclusions and logistics criteria, to favour success and conclusive results. The proposed trial should be designed with proper patient selection, diagnostic protocols (e.g. phagogram), production protocols (purification, stability, host selection, etc.) and treatment protocols (including dosage, repetition, duration, route of administration).

All available information about the characteristics of the phages to be used in the clinical trial should be provided (e.g. sequence, stability, targeted bacteria, registration in a phage bank or phage registry, etc.). Moreover, any additional indication of the use of phages for other applications than human use in the clinical trial (e.g. veterinary use, surface cleaning, food preservation) should be detailed in the proposal if available.

The use of computational modelling and/or artificial intelligence (AI) tools is encouraged to speed/optimize trial design, implementation and/or the analysis of large data. In the same way, the use of innovative *in silico*, *in vitro* or *in vivo* models to facilitate pre-clinical selection of phages to use in the clinical trial is welcome.

⁸¹ <https://iris.who.int/bitstream/handle/10665/376776/9789240093461-eng.pdf?sequence=1>

⁸² <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9598614>

In their proposal applicants should describe how they take into account scientific advice or protocol assistance from the European Medicines Agency (EMA)⁸³. In addition, applicants should provide a sound timeline on the trial protocol in their proposal. Furthermore, in their proposal applicants should also provide a delivery date for approval of the RCT protocol from the regulatory body(ies), which should be within 12 months from the start of the project.

Applicants should propose a clear exploitation pathway through the different necessary steps (research, manufacturing, regulatory approvals and licensing, Intellectual Property management, etc.) in order to accelerate marketing authorisation and uptake by the health systems.

The participation of start-ups, micro, small and medium-sized enterprises (SMEs)⁸⁴ is encouraged with the aim of strengthening their scientific and technological foundations, enhancing their innovation potential, and exploring possibilities for commercial exploitation.

Proposals should adhere to the FAIR⁸⁵ data principles, adopt wherever relevant, data standards and data sharing/access good practices, and apply good practices for GDPR⁸⁶ compliant personal data protection.

Sex and gender-related differences should be addressed, where relevant. To ensure that the needs of patients living with chronic infections are adequately addressed and that there is public acceptability and confidence on innovative phage-based therapies, the involvement of patient and/or civil society representatives in all phases of the research and development process is strongly encouraged. For this, the topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

Applicants should provide details of their clinical studies⁸⁷ in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

HORIZON-HLTH-2025-03-DISEASE-02-two-stage: Advancing innovative interventions for mental, behavioural and neurodevelopmental disorders

Call: Cluster 1 - Health (Two stage - 2025)	
Specific conditions	
<i>Expected EU</i>	The Commission estimates that an EU contribution of between EUR

⁸⁵ See definition of FAIR data in the introduction to this work programme part.

⁸⁶ General Data Protection Regulation: https://commission.europa.eu/law/law-topic/data-protection_en

⁸⁷ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

Horizon Europe - Work Programme 2025
Health

<i>contribution per project</i>	6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 50.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants submitting a proposal under the blind evaluation pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>For the first stage, the thresholds for each criterion will be 4 (Excellence) and 4 (Impact). The overall threshold applying to the sum of the two individual scores will be set at a level that ensures the total requested budget of proposals admitted to stage 2 is as close as possible to four times the available budget, and not less than three and a half times the available budget.</p> <p>For the second stage, the thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>

<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ⁸⁸.</p>
---	--

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to all the following expected outcomes:

- The scientific and clinical communities make effective use of state-of-the-art knowledge, data, technologies, tools, methods, best practices, and trainings to underpin and complement the development of innovative interventions⁸⁹ aimed at achieving a lasting benefit.
- The scientific and clinical communities benefit from the exchange of data, knowledge and best practices, thereby strengthening their collaboration in the EU, the Associated Countries and beyond.
- The scientific and clinical communities make wide use of relevant databases and/or integrate them with existing infrastructures for storage and sharing of collected data according to FAIR⁹⁰ principles, thereby encouraging further use of the data.
- Policymakers, funders, scientific and clinical communities, patient organisations, regulators, and other relevant bodies are informed of the research advances made and the requirements for a widespread implementation of the innovative therapeutic interventions and complementary approaches.
- Patients and caregivers are constructively engaged with the research, ensuring that their needs are catered for, with the aim of tangibly benefitting from the interventions.

Scope: Mental, behavioural and neurodevelopmental disorders, that include for example severe depression, anxiety, schizophrenia, psychosis, post-traumatic stress disorder (PTSD), addictive behaviours (drugs⁹¹, alcohol, gaming and others), obsessive-compulsive disorder,

⁸⁸ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁸⁹ Innovative interventions should be based on new and/or alternative approaches that are aimed at achieving a lasting therapeutic benefit. The innovative intervention should be a combination of a product based on an active substance that is complemented by another multidisciplinary approach.

⁹⁰ See definition of FAIR data in the introduction to this work programme part.

⁹¹ If proposals concern drug addiction, they are encouraged to liaise with the EU Drugs Agency.

eating disorders and autism spectrum disorder are a high burden for patients, health systems and society, and remain unmet medical needs. More innovative, safer and more effective therapeutic and relapse-preventing solutions based on active substances are required, as for example for mental disorders many available treatments show modest efficacy, non-negligible side effects, discontinuation problems and high relapse rates. Additionally, other non-invasive multidisciplinary and/or transdiagnostic approaches (e.g. neurostimulation, neuroimaging, digital, non-pharmaceutical, psychotherapy, psychosocial) should be further developed to complement the therapeutic and relapse prevention solutions. These approaches aim to further improve health outcomes, self-determination, autonomy and quality of life in the long-term.

The disorders within the scope of this topic fall under Chapter 6 of the International Classification of Diseases⁹². Rare diseases are excluded⁹³.

Proposals should address most of the following aspects:

- Perform rigorous clinical studies into the safety and efficacy of the innovative interventions and their mode of administration, ensuring adequate cohorts/sample sizes with adequate representation of the patient population, including in terms of age, sex and ethnicity.
- Through the clinical studies, gain further insight into the mechanism(s) of action of the innovative therapies and complementary approaches. This could entail analyses of imaging (e.g. MRI, ultrasound, nuclear imaging), as well as physiological, molecular, biochemical or omics signatures revealing potential perturbations prior to the intervention and recovery thereafter, and it could lead to the development of surrogate endpoints. This insight should open the path to more personalised interventions and approaches.
- Use and/or develop technologies, including digital ones (e.g., (generative) Artificial Intelligence - AI⁹⁴, wearable technologies) to help implement and monitor the long-term efficacy of the intervention(s), as well as manage the disorder and/or monitor their progression (e.g. with unobtrusive technologies suitable for patient monitoring at home and in real-world conditions), whilst also ensuring they are bias-free, inclusive, and ethically sound.
- Exploit existing data, biobanks, registries and/or cohorts, together with the generation of new data that should be managed in line with the FAIR principles.

⁹² International Classification of Diseases 11th Revision (ICD-11), developed by the World Health Organization (WHO); Chapter 6: 'Mental, behavioural or neurodevelopmental disorders'.

⁹³ Rare diseases, as defined by the European Union Regulation on Orphan Medicinal Products (1999), being a disease that affects not more than 1 person per 2000 in the European population (<https://www.orpha.net/>).

⁹⁴ Generative AI is a type of AI technology that can generate various forms of new content such as text, images, sounds, and even code, such as for programming or gene sequencing (<https://ec.europa.eu/newsroom/dae/redirection/document/101621>).

- Engage all relevant stakeholders (especially patients and patients' representatives for the disorder, caregivers, clinicians, counsellors, regulators, etc.) to design end-user optimised interventions, applying gender-sensitive and intersectional approaches.
- Advance research by leveraging already existing and emerging state-of-the-art research infrastructures (e.g. ECRIN⁹⁵, EATRIS⁹⁶, EBRAINS⁹⁷, BBMRI⁹⁸, EuroBioImaging⁹⁹, European Genomic Data Infrastructure¹⁰⁰, etc.), as well as results stemming from EU-supported research projects, where applicable.
- Engage with national public health authorities and regulators to ensure a robust development pathway and further uptake of the intervention.

The participation of start-ups, micro, small and medium-sized enterprises (SMEs)¹⁰¹ is encouraged with the aim of strengthening their scientific and technological foundations, enhancing their innovation potential, and exploring possibilities for commercial exploitation.

Funded projects should liaise with the European Partnership for Brain Health (covered by topic HORIZON-HLTH-2025-02-DISEASE-01) once launched.

The topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

All projects funded under this topic are strongly encouraged to participate in networking and joint activities, as appropriate. Therefore, proposals should include a budget for the attendance to regular joint meetings and may consider covering the costs of any other potential joint activities without the prerequisite to detail concrete joint activities at this stage. The details of these joint activities will be defined during the grant agreement preparation phase.

Applicants invited to the second stage should provide details of their clinical studies¹⁰² in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

HORIZON-HLTH-2025-01-DISEASE-03: Development of antibodies and antibody-derived proteins for the prevention and treatment of infectious diseases with epidemic potential

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 50.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹⁰³.</p>

¹⁰³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to all the following expected outcomes:

- The scientific and clinical communities have a better understanding of prophylactic and treatment options complementary to low molecular weight antiviral therapeutics for viruses with epidemic potential.
- The scientific and clinical communities have access to experimental antibodies and antibody-derived proteins for the prevention and treatment of emerging or re-emerging viral infections, as well as for further clinical investigation.
- Candidate antiviral therapies, including potentially those of broad spectrum are available for emerging and re-emerging viral infections, increasing therapeutic options for clinical deployment in case of an epidemic or pandemic.

Scope: As shown by the COVID-19 pandemic, infectious diseases remain a major threat to health and health security in the EU and globally. Viral disease emergence is expected to accelerate due to among other, climate change, and thus a proactive approach to the development of antiviral prophylactics and therapeutics in preparedness for future infectious disease outbreaks is needed. The availability of antibodies and antibody-derived proteins would provide a critical preparedness measure against future health threats, due to infectious disease epidemics or pandemics.

Proposals should exclusively pursue the development of existing antiviral and prophylactic and therapeutic candidates that are based on antibody and/or antibody-derived proteins targeting at least one of the priority viruses:

- Arenaviridae: Junin mammarenavirus, Lassa mammarenavirus
- Hantaviridae: Hantaan virus, Andes virus, Sin Nombre virus
- Poxviridae: Variola major
- Paramyxo: Hendra, Nipah virus
- Togaviridae: Venezuelan equine encephalitis virus

Proposals are expected to conduct preclinical studies of antibodies and antibody-derived proteins, prepare Good Manufacturing Practice (GMP)¹⁰⁴ quality test batches and carry out first in human clinical safety studies. Proposals should include a critical discussion of to what extent the antibodies and antibody-derived proteins would be expected to be amenable to production and distribution at an affordable cost and at a scale sufficient to meet demand in a pandemic.

¹⁰⁴

<https://www.who.int/teams/health-product-policy-and-standards/standards-and-specifications/gmp>

Proposals should thus aim to diversify and accelerate the global prophylactic and therapeutic research and development portfolio for emerging and re-emerging viral infections, and to strengthen the leading role of the EU in prophylactic and therapeutic research and development.

Proposals may focus either on antibody or on antibody-derived proteins, or both.

Proposals should address all the following areas:

- If necessary, finalisation of the in vitro characterisation of the existing antibody and antibody-derived protein candidates with regard to target specificity, epitope recognised, and their ability to impair or inactivate viral functions.
- In vivo tests in at least one animal model or, if available in humanised immune system animal models, to demonstrate the protective function of the antibodies and antibody-derived therapeutics deemed sufficient for moving to first clinical trials.
- If requested by regulators as enablers for clinical studies, in vivo tests in a non-human primate model.
- Production of GMP quality test batches of the most promising candidates for antibodies and antibody-derived proteins in the EU or the European Economic Area.
- First in human clinical safety studies of the antibody and antibody-derived proteins, demonstrating a clear regulatory pathway for market authorisation. Attention should be paid to critical biological and social factors such as sex, age, ethnicity and disability.

Participation of third countries where viruses addressed in the proposal are endemic or where outbreaks have occurred or are ongoing is encouraged.

The participation of start-ups, micro, small and medium-sized enterprises (SMEs)¹⁰⁵ is encouraged with the aim of strengthening their scientific and technological foundations, enhancing their innovation potential, and exploring possibilities for commercial exploitation.

Applicants are expected to engage with regulatory bodies in a timely manner to ensure adequacy of the actions from a regulatory point of view.

Proposals should advance research by leveraging already existing and emerging state-of-the-art research infrastructures such as those having contributed to the services developed under the ISIDORE project¹⁰⁶.

Applicants should provide details of their clinical studies¹⁰⁷ in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

HORIZON-HLTH-2025-01-DISEASE-04: Leveraging artificial intelligence for pandemic preparedness and response

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 35.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination "Tackling diseases and reducing disease burden". To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to all the following expected outcomes:

- The potential of Artificial Intelligence (AI) is used in all aspects that determine optimal pandemic preparedness and response, and fast learning systems are supported, to the benefit of scientists, public health responders and policymakers. This includes using the full potential of available quality data for research and innovation to transform the development of medical, social or logistical countermeasures, as well as the detection,

¹⁰⁷ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

management and monitoring of emergencies at population levels, and the diagnosis, treatment, and prevention at the level of individuals.

- European pandemic preparedness and response benefits from readily available, trustworthy and ethical AI-based tools and technologies that enable it to act fast and in a targeted manner, to timely detect and understand emerging infectious threats, to respond adequately and proportionally to identified threats, and to control such threats effectively and efficiently.
- Different data types from multiple sources and disciplines across the EU and globally can be accessed, integrated and analysed by scientists, public health responders and policymakers, using trustworthy and ethical AI-based tools and technologies that support pandemic preparedness and response.

Scope: The COVID-19 pandemic underscored the need of finding innovative approaches to pandemic preparedness and response, including digital solutions leveraging AI technologies. AI is a fast-developing field, holding an enormous potential in using the multitude of data from an equally vast range of sources, which should be used for improving preparedness and response to epidemics or pandemics in the EU and Associated Countries.

Examples from the COVID-19 pandemic response illustrate how advanced AI tools can enable efficient data use to support areas like forecasting, infectious disease surveillance and monitoring, development of medical interventions, timely diagnosis of infection, disease prognosis, or real-time monitoring of adherence to public health recommendations. New technologies with potentially high impact like air or wastewater real-time monitoring systems have also emerged.

These experiences and advances hold great potential for the future, but additional development and expansion of novel AI-based tools and technologies (including generative AI) is needed, while also further improving and testing existing ones. The use of AI on diverse datasets, as well as on their combinations within and across disciplines, can greatly increase the accuracy of assessments and predictions of medical (pharmaceutical or non-pharmaceutical) interventions in preparedness for, and response to epidemics and pandemics.

Research actions under this topic should include several of the following activities:

- Develop new, or improve existing AI-based tools, methods and technologies, geared towards greater safety, efficiency and impact of medical, societal or logistical countermeasures aiming at the prevention, containment or control of infectious disease epidemics or improved response management of health systems.
- Scout, assemble and prepare appropriate FAIR¹⁰⁸ datasets generated across the EU and Associated Countries (e.g. COVID-19, Influenza, etc.), for the development, training and testing of targeted AI-supported generative assessment and prediction tools, in support of evidence-based policy and decision making for pandemic preparedness and response; in

¹⁰⁸ See definition of FAIR data in the introduction to this work programme part.

areas like surveillance and monitoring of infectious disease and disease dynamics, facilitating differential diagnosis, triage and risk group predictions, predicting drug response and disease progression, etc.

- Leverage the capacities of the existing and emerging data research infrastructures and the future European Health Data Space (EHDS)¹⁰⁹ and the European Open Science Cloud (EOSC)¹¹⁰ architectures and research environments, while comprehensively addressing cybersecurity, data privacy, trustworthiness, equity and data quality, interoperability and access modalities.
- Identify and address the current technical, operational, and social limitations related to the (cross-border) access to quality data and to the smooth implementation of AI-driven solutions in the societal and legal context of the EU and Associated Countries.
- Engage with end-users, policymakers, regulatory bodies and authorities, and other stakeholders in the development, improvement, testing and validation of trustworthy and ethical AI-based tools and technologies, to propose options for the validation and uptake of the novel AI tools in real-world settings taking into consideration aspects like training needs, responsible use, users' trust, energy consumption, etc.

The participation of start-ups, micro, small and medium-sized enterprises (SMEs)¹¹¹ is encouraged with the aim of strengthening their scientific and technological foundations, enhancing their innovation potential, and exploring possibilities for commercial exploitation.

Proposals selected for funding under this topic are expected to participate in joint activities as appropriate, which can take the form of project clustering, workshops, joint dissemination activities, etc. Applicants should anticipate budget to cover this collaboration.

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

Particular attention should be paid to detecting and mitigating gender, ethnicity and other biases, aiming to develop AI models that are fair, trustworthy, and beneficial for all. Proposals are encouraged to explore potential synergies with the projects funded under the topic HORIZON-CL4-2021-HUMAN-01-24: “Tackling gender, race and other biases in AI (RIA)”, as well as under the topic SC1-PHE-CORONAVIRUS-2020-2C: “Behavioural, social and economic impacts of the outbreak response”.

Applicants envisaging to include clinical studies¹¹² should provide details of their clinical studies in the dedicated annex using the template provided in the submission system.

HORIZON-HLTH-2025-01-DISEASE-05: Support for the functioning of the Global Research Collaboration for Infectious Disease Preparedness (GloPID-R)

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, legal entities established in the United States of America may exceptionally participate as a beneficiary or affiliated entity, and are eligible to receive Union funding.</p> <p>Coordinators of projects must be legal entities established in an EU Member State or Associated Country.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the</p>

¹¹² Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

	Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹¹³ .
--	--

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to some of the following expected outcomes:

- International research funders are supported by a dynamic and efficient secretariat in their coordination efforts for a rapid research response when a pandemic or a severe epidemic strikes.
- International research funders can rely on a tested framework underpinning a rapid and effective research response, and as such ensure stronger research preparedness and response for public health emergencies, including in cross-cutting areas such as data sharing, social science, clinical trial networks and others.
- Research funders, policymakers and the research community are well informed of the activities of the members of the Global Research Collaboration for Infectious Disease Preparedness (GloPID-R)¹¹⁴, both as a group and individually.

Scope: Recent history has illustrated the potential extent of threats posed by new or emerging infectious diseases, as well as the central importance of global collaboration and coordination to fight such regional or international challenges. GloPID-R was established in 2013 for this reason, in response to a request for coordination by the Heads of International Research Organisations. GloPID-R now provides a widely recognised platform for infectious disease research funders to work together to better tackle severe epidemics such as Ebola or Zika, pandemics at regional level that affect outermost regions, as well as global pandemics such as COVID-19.

GloPID-R enables coordination between funders and with relevant global actors such as the World Health Organization (WHO) or the Coalition for Epidemic Preparedness Innovation (CEPI); or promotes exchanges and synergies between funded researchers. The GloPID-R’s regional hubs strategy fosters regional research priorities and funder engagement. The network is engaged among others in efforts to strengthen the coordination of clinical trial responses, to track research and evidence on diseases with pandemic potential, or to coordinate funding for cross-cutting research on pandemic preparedness.

Proposals should foresee administrative and technical support through a secretariat to maintain, but above all to support GloPID-R’s continuous evolution for an optimal value added.

¹¹³ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹¹⁴ <https://www.glopid-r.org>

Proposals are expected to cover all the following activities:

- Provide administrative and organisational support to the Board of GloPID-R, in close collaboration with the European Commission;
- Provide strong scientific support through a transparent process on topics requested by the GloPID-R Board, independent scientific advisors or (working) groups;
- Facilitate the work of the GloPID-R working groups and scientific advisors, using earlier experience in research preparedness and response to infectious disease outbreaks;
- Manage fluid information dissemination and communication between the Board, Members, scientific advisors, working groups, enquiries, and outside stakeholders;
- Ensure strong external communications activities, e.g. through the website, newsletter, and social media;
- Submit an annual work plan to the Commission each year following the annual meeting of GloPID-R, taking into account the conclusions of the annual meeting;
- Ensure a high level of adaptability to respond to rapidly evolving situations, following the guidance of the GloPID-R Board.

HORIZON-HLTH-2025-01-DISEASE-06: Implementation research addressing strategies to strengthen health systems for equitable high-quality care and health outcomes in the context of non-communicable diseases (GACD)

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 20.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of</p>

	Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to some of the following expected outcomes:

- Healthcare practitioners and providers in low- and middle-income countries (LMICs)¹¹⁵ and/or those in high-income countries (HICs) serving disadvantaged populations have access to information allowing to strengthen health systems for equitable high-quality care and health outcomes in the context of non-communicable diseases (NCDs).
- Public health managers and authorities have access to improved insights and evidence on how to decrease the fragmentation of care for patients living with NCDs and ensure continuity of care across all stages of disease progression, including prevention, risk reduction, and timely diagnosis of NCDs. They use this knowledge to design policies to reduce health inequities and to promote equitable health outcomes.
- Researchers, clinicians and authorities have an improved understanding how the proposed interventions for strengthening health systems for equitable high-quality care and health outcomes in the context of NCDs could be adopted in LMICs and/or disadvantaged populations of HICs setting, taking into account specific social, political, economic and cultural contexts.
- Communities, local stakeholders and authorities are fully engaged in implementing and taking up interventions that strengthen health systems for equitable high-quality care and health outcomes in the context of NCDs and thus contribute to deliver better health, improve quality of life across the life course and extend healthy life expectancy.

Scope: The European Commission is a member of the Global Alliance for Chronic Diseases (GACD)¹¹⁶. The GACD specifically addresses NCDs and supports implementation science to improve health outcomes. This topic is launched in concertation with the other GACD members (international funding agencies) and aligned with the 10th GACD call.

Health systems in many countries have not kept pace with the rapid emergence of NCDs that require costly long-term care and treatment. Resilient, fit for purpose health system should provide high-quality, safe, equitable, accessible healthcare, that reflects the needs of the

¹¹⁵ As defined by the World Bank.

¹¹⁶ <https://www.gacd.org>

population, and enables the integration of healthcare across the care continuum, encompassing prevention, screening, diagnosis and long-term management of NCDs¹¹⁷. While health systems across the world struggle with these challenges, this is a particular problem in LMICs that have relatively overburdened, poorly resourced and fragile health systems that struggle to cope with the burden of NCDs. Health inequalities (e.g. linked to geographical location, socioeconomic status, sex and/or gender, ethnicity, disability) are often accentuated by structural and/or systemic weaknesses such as lack of staff and appropriate medicines.

The increasing burden of NCDs on healthcare systems has spurred a greater interest in exploring strategies to tackle these conditions, including a move from a healthcare system focused on disease and hospital-based care, to a more holistic model, involving communities and primary care, and focused on maintaining health^{118,119}. These include interventions addressing the integration of and access to care, screening, access to medicines and technologies, task shifting and digital health interventions. Implementing these strategies while retaining a focus on equity is challenging and health systems need to account for geographical disparities as well as reach communities that have traditionally suffered health inequalities. Equity in health requires that resources and processes are designed to promote equalisation of health outcomes for populations experiencing health disparities, to ensure similar health outcomes for all of society¹²⁰.

Evidence for how to strengthen health systems to improve services and ensure equitable health outcomes is emerging, mostly from research in HICs. However, implementing equity-oriented interventions for transformation and/or strengthening of health systems remains challenging and largely unexplored in underserved populations, especially in LMICs. Providing evidence on implementation strategies that can enable effective adaptation and scaling of programmes will be critical to improving survival and quality of life as well as reducing disability, the burden of caretaking on (typically female) family members and costs of healthcare falling on households.

This implementation research topic is therefore focused on strategies to support health system transformation and/or strengthening using evidence-based interventions in the context of NCDs that can be adapted to and implemented in LMICs and/or disadvantaged populations experiencing health disparities in HICs to encourage equitable health outcomes.

The proposed implementation research should be focused on one or more evidence-based interventions (or complex interventions) focused on building equity-orientated health systems change to tackle the growing burden of chronic conditions, including NCDs. The choice of intervention(s) and provision of existing evidence of the intervention's effectiveness, cost-

¹¹⁷ Kruk ME, Pate M, Mullan Z. Introducing The Lancet Global Health Commission on High-Quality Health Systems in the SDG Era. *Lancet Glob Health*. 2017 May;5(5):e480-e481.

¹¹⁸ Hunter DJ, Bengoa R, Meeting the challenge of health system transformation in European countries, *Policy and Society*, Volume 42, Issue 1, March 2023, Pages 14–27.

¹¹⁹ The WHO has produced a series of recommendations for strengthening health systems, to improve capacity and services to tackle NCDs, with an eye to understanding how the service improvement will be scaled up system-wide; https://apps.who.int/gb/ebwha/pdf_files/WHA66-REC1/A66_R1_ANX4-en.pdf

¹²⁰ Health equity is achieved when everyone can attain their full potential for health and wellbeing.

effectiveness, sustainability, scalability and potential for long-term health and other impacts should be justified (and in what context this evidence has been generated). As the evidence underpinning strategies to transform and/or strengthen health systems in the context of NCDs is still emerging, particularly in LMICs, a limited period of testing the effectiveness of an intervention that the applicant's team has adapted for local implementation is therefore usually appropriate.

Applicants should explore the implementation of proposed intervention(s) for a selected study population(s) taking into account the unique social, political, economic, and cultural context(s) in which the study will take place. Applicants should justify why any adaptation will not compromise the known effectiveness of the selected intervention(s).

Proposals should address all the following activities¹²¹:

- Provide a research plan using validated implementation research frameworks or hybrid design research;
- Have an appropriate strategy for measuring implementation research outcomes and real-world effectiveness outcomes and indicators. Other health or non-health outcome measures, especially those identified as important by patient participants and/or critical for advancing Universal Health Coverage (UHC)¹²², are also welcome;
- Specifically address health equity and the principles of UHC;
- Engage an appropriately expert and skilled research team which can ensure a suitable multidisciplinary approach and that demonstrates equitable partnership and shared leadership between HIC-LMIC, and/or non-Indigenous-Indigenous members of the project team and external stakeholders through a clear governance strategy;
- Provide a stakeholder engagement strategy with evidence of support/engagement from key stakeholders for delivering patient-centred care;
- Ensure that project partners are engaged from the beginning to contribute to the sustainability of the intervention after the end of project. Proposals should demonstrate sustainability of the strategy, beyond the lifespan of the project;
- Provide opportunities for implementation research capacity building for early career researchers and team members from lower resourced environments, such as LMICs or disadvantaged communities;

¹²¹ The following types of proposals are not in the scope of this topic: i) proposals with the primary aim of informing the development and/or selection of an intervention for a given context, where the implementation component will be explored in a future project (i.e. standalone feasibility projects); ii) epidemiological cohorts; iii) etiological work, mechanistic, or epidemiological research, unless an essential component of a focused study to develop implementation research approaches; iv) clinical trials, validation studies, or intervention efficacy studies for a new or established pharmacological agent or behavioural intervention.

¹²² <https://www.who.int/health-topics/universal-health-coverage>

- Ensure meaningful involvement of early career team members, including at least one early career member as a co-investigator.

The study population may include the general population, people with one or more existing NCDs, those currently without NCDs, or a combination of both. The study population may also include patients with NCDs and chronic infectious disease(s) (e.g., studies that focus on integrating NCD management into an HIV or tuberculosis clinic). With regard to NCDs, applicants are encouraged to explore any chronic non-communicable condition (or combination of conditions), including mental health disorders, neurological disorders and sleep disorders.

Proposals are expected to use an appropriate implementation research design and frameworks for feasibility studies, cluster randomised control trials (cRCTs), before and after studies, and additional implementation science classifications of study designs (e.g. hybrid designs)^{123,124}.

Applicants are not limited to use any particular design, however a validated implementation research framework should underpin the study.

Proposals would be expected to generate evidence that is of direct relevance to policymakers, communities and practitioners. Also, proposals will require a strategy to include the relevant policymakers, local authorities, as well as other stakeholders such as community groups, or other individuals or organisations involved in the implementation of the intervention, with co-creation from the development of the project through to the implementation knowledge translation phase. Applicants should also provide a clear plan for continuing to engage with stakeholders.

Stakeholders also include patients, their family members and carers. Their contributions should be nurtured through meaningful engagement from the outset, not only as participants in the research undertaken. Patient engagement throughout the research project is critical to developing patient-centred models of care.

All stakeholders should be engaged at every stage of the research project, from initial ideation of research questions, throughout the duration of the project, and afterwards during the

¹²³ Examples of frameworks include (this list is not exclusive): i) Consolidated Framework for Implementation Research (CFIR); ii) the context enhanced (RE-AIM) Reach, Effectiveness, Adoption, Implementation, Maintenance); iii) Practical Robust Implementation and Sustainability Model (PRISM) frameworks.

¹²⁴ The following are potential interventions or strategies that applicants may consider in their implementation plan (please note that this is not an exhaustive list): i) Strengthening within the workforce including: training; task shifting within healthcare services; multi-disciplinary teams; community outreach; and the care continuum; ii) Changes in health or related facilities, including relationships, engagement and linkages between facility levels (primary, secondary, tertiary), regional specialist care, pharmacies, and community healthcare; iii) Digital or information technologies in health systems to improve condition management; shared records; coordination in continuum of care; self-management and equitable health outcomes; iv) Implementation of new technologies, innovations for screening, earlier diagnosis and better management of NCDs; v) Ensuring equitable access to good quality medicines (priority medicine lists and financing, monitoring; procurement and distribution; charging and fees); vi) Health policy entrepreneurship linked to solving or capitalizing a policy or practice issues/innovations that have a clear link with service delivery or health promotion with NCDs.

knowledge translation phase. It is also important to include stakeholders who can help sustain the project's implementation, facilitate scale up, and use the knowledge generated from the project after the grant ends.

Poverty, racism, gender inequality, ethnic discrimination, and other inequities are directly associated with reduced potential for equitable access to quality care. Proposals should consider the social determinants of health and discuss their potential impact on the effective implementation of the intervention(s). If there is a focus on a particular population (e.g., gender, race and/or ethnicity), then the reason for this should be justified.

In order to promote health equity, proposals should aim to address differences in intervention access, uptake, and effectiveness in socially disadvantaged groups and develop strategies for reducing inequities. To facilitate this process at the data analysis stage, studies should be designed to address such differences. At a minimum, studies should capture and disaggregate data on sex and/or gender differences. If feasible, a plan for capturing intersectional impacts on health outcomes should be included in the analysis strategy.

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

All projects funded under this topic are strongly encouraged to participate in networking and joint activities, including internationally, as appropriate. These activities could, for example, involve the participation in joint workshops, the Annual Scientific Meetings of the GACD, the exchange of knowledge, the development and adoption of best practices, or joint communication activities. Therefore, proposals are expected to include a budget for such activities and may consider covering the costs of any other potential joint activities without the prerequisite to detail concrete joint activities at this stage. The details of these joint activities will be defined during the grant agreement preparation phase.

Applicants envisaging to include clinical studies¹²⁵ should provide details of their clinical studies in the dedicated annex using the template provided in the submission system.

HORIZON-HLTH-2025-01-DISEASE-07: Tackling high-burden for patients and under-researched medical conditions

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal

¹²⁵ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

	requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>In order to ensure a balanced project portfolio with regard to the medical condition targeted¹²⁶, grants will be awarded (within available budget) to proposals not only in order of ranking but also in function of the highest ranked proposals in different medical conditions, provided that the applications attain all thresholds available.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to most of the following expected outcomes:

- The scientific and clinical communities make effective use of state-of-the-art information, data, technologies, tools and best practices to better understand the condition, underpinning the development of diagnostics, therapeutics and/or preventive strategies.
- The scientific and clinical community exchange data, knowledge and best practices, thereby strengthening their collaboration and building knowledge and care networks in Europe and beyond.

¹²⁶ Medical condition i to v, as given in the scope of this topic.

- The scientific and clinical community make wide use of newly established and where relevant open access databases and/or integrate them with existing infrastructures for storage and sharing of collected data according to FAIR¹²⁷ principles, thereby encouraging further use of the data.
- Policymakers and funders are informed of the research advances made and consider further support in light of the sustainability of the studies.
- Patients and caregivers are constructively engaged with the research, which also caters for their needs.
- Health professionals have access to and use improved clinical guidelines on diagnosis and/or treatment of the condition.

Scope: A number of medical conditions fail to be recognised and/or be correctly diagnosed in a significant proportion of patients. As a consequence, they are inadequately treated and often can become a chronic and high burden for the patient. These medical conditions¹²⁸, including:

- i. myalgic encephalomyelitis/chronic fatigue syndrome,
- ii. autism,
- iii. gynaecological diseases,
- iv. low back pain,
- v. other¹²⁹,

may be insufficiently researched even though they manifest with high prevalence.

Applicants should explicitly state in their proposal which of the above medical conditions is targeted and the proposed work should address only this specific medical condition. Please note that the following medical conditions are not in the scope of this topic: rare diseases, including rare cancers, and under-research medical conditions already addressed by projects funded under topic HORIZON-HLTH-2024-DISEASE-03-14-two-stage¹³⁰.

Research actions under this topic should include all the following activities, ensuring multidisciplinary approaches and a broad representation of stakeholders in the consortia:

¹²⁷ See definition of FAIR data in the introduction to this work programme part.

¹²⁸ High-burden medical conditions could for instance include those that are either life-threatening or lead to chronic invalidity or a severely reduced quality of life.

¹²⁹ The European Commission commissioned an independent scoping study to help identify high-burden under-researched medical conditions and define the type of research and/or research priorities to better address the different needs of patients with these conditions. The study delivered a discussion paper with a non-exhaustive list of conditions/groups of disorders identified as being high-burden and under-researched. This document is available at <https://op.europa.eu/en/publication-detail/-/publication/eae32303-96e3-11ed-b508-01aa75ed71a1/language-en>

¹³⁰ [https://cordis.europa.eu/search?q=programme%2Fcode%3DHORIZON-HLTH-2024-DISEASE-03-14-two-stage'](https://cordis.europa.eu/search?q=programme%2Fcode%3DHORIZON-HLTH-2024-DISEASE-03-14-two-stage)

- Proposals should address the gaps in robust, scientific evidence for improved policies and practices to tackle such a medical condition and aim at identifying the pathophysiological mechanism(s) (e.g. genetic, cellular and molecular) and potential risk factors (e.g. psychological and environmental) of the medical condition through basic, pre-clinical and/or clinical research. These efforts should underpin the development of diagnostics, therapeutics, and/or preventive strategies for the condition.
- Proposals should demonstrate that the medical condition under study is insufficiently understood, inaccurately diagnosed or inadequately treated in a significant proportion of patients, and as such represent a high burden for patients and society. This could be through referencing key literature.
- Sex and gender-related aspects, age, ethnicity, socio-economic, lifestyle and behavioural factors should be taken into consideration. In addition, the emotional and societal long-term effects of these chronic disorders for the affected individuals should be addressed.
- Where applicable, the development of biomarkers and other technologies for diagnosis, monitoring in patients, and stratification of patient groups should be considered.
- Where applicable, the development of clinically relevant, (non-)human model systems that can complement clinical investigations should be considered.
- Exploitation of existing data, biobanks, registries and cohorts is expected, together with the generation of new (e.g. genomics, epigenomics, transcriptomics, proteomics) data.
- To enable sharing of samples, quality data and advanced analytical tools, it is encouraged to make use of existing infrastructures developed at the European¹³¹ or national level.
- Inclusion of patients or patient organisations in the research is strongly encouraged, to ensure that their views are considered.
- Participation of startups and small and medium-sized enterprises (SMEs) is strongly encouraged.

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

Applicants should provide details of their clinical studies¹³² in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

¹³¹ A variety of infrastructures have been developed at European level and include, for example, the BBMRI-ERIC (<https://www.bbMRI-eric.eu>) research infrastructure for biobanking, while others are being developed like the federated European infrastructure for genomics data.

HORIZON-HLTH-2025-02-DISEASE-01: European Partnership for Brain Health

Call: Partnerships in Health (2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 150.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 150.00 million.
<i>Type of Action</i>	Programme Co-fund Action
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding. Because the US contribution will be considered for the calculation of the EU contribution to the partnership, the concerned consortium of research funders from eligible EU Members States and Associated Countries must expressly agree to this participation.</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. Financial support provided by the participants to third parties is one of the primary activities of the action in order to be able to achieve its objectives. Given the type of action and its level of ambition, which could entail costly pilot clinical studies, the maximum amount to be granted to each third party is EUR 3.00 million. However, if the objectives of the action would otherwise be impossible or overly difficult (and duly justified in the proposal) the maximum amount may be higher.</p>

¹³² Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

	The funding rate is up to 30% of the eligible costs.
<i>Total indicative budget</i>	The total indicative budget for the topic is EUR 150 million committed in annual instalments over the 3 years, 2025-2027 (EUR 56.5 million from the 2025 budget, EUR 46.5 million from the 2026 budget and EUR 47 million from the 2027 budget).

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to all the following expected outcomes:

- The position of the EU and Associated Countries is strengthened as an internationally recognised driver of research and innovation on brain health¹³³, thereby contributing to the achievement of the Sustainable Development Goals related to neurological and mental health.
- Research funders align, adopt and implement their brain health research policies allowing for the optimal generation and translation of knowledge into tailored health products and interventions to (i) promote brain health throughout the lifetime, (ii) prevent neurological and mental disorders, and (iii) improve diagnosis, treatment and care to enhance the quality of life of those living with brain disorders, as well as their caregivers, whilst also considering cultural, ethical, legal and social aspects.
- Research funders, policymakers, relevant agencies and authorities, researchers, innovators, citizens, people living with brain disorders and their caregivers and advocates enhance their collaboration forming a strong, structured and integrated research and innovation ecosystem with shared evidence, tools and methodologies cutting across sectors.
- The brain health research community at large benefits from and uses an improved comprehensive knowledge framework integrating the EU, national/regional data and information infrastructures to improve transnational research.
- People living with a brain disorder benefit from (i) a more timely, equitable access to accurate diagnosis and tailored care and treatment options in an innovative, sustainable and high-quality healthcare system that is well integrated with the research community, and from (ii) less discrimination and stigma, and social inclusion.
- Public and private actors, including civil society (e.g. Non-Governmental Organisations, charities), establish coordinated and efficient multi-stakeholder collaborations at national

¹³³ In the context of the partnership, ‘brain health’ should be interpreted along the lines of the World Health Organisation’s (WHO) definition (‘Brain health is the state of brain functioning across cognitive, sensory, social-emotional, behavioural and motor domains, allowing a person to realise their full potential over the life course, irrespective of the presence or absence of disorders’) and includes both neurological and mental health.

level in the EU and Associated Countries, allowing for more effective basic and clinical research and enhanced translation into tailored products and interventions.

Scope: The partnership should contribute from the research and innovation angle to priorities set in the “Healthier Together - EU Non-Communicable Diseases Initiative” (2022-2027), which includes a focus area on mental health and neurological disorders¹³⁴, as well as to the “Communication on a comprehensive approach to mental health” (COM(2023) 298 final)¹³⁵.

The partnership should also contribute from the research and innovation angle to achieving the objectives of the Pharmaceutical Strategy for Europe¹³⁶, in terms of fulfilling unmet medical needs (numerous in the fields of neurological and mental disorders) and to ensuring that the benefits of innovation reach patients in the EU and Associated Countries. Moreover, it should support the objectives of the EU4Health Programme¹³⁷.

Additionally, the partnership should contribute from the research and innovation angle to the “Communication on the European Care Strategy” (for caregivers and care receivers; COM(2022) 440 final)¹³⁸, which aims to ensure high quality, affordable and accessible care services for all ages. By fostering data sharing and boosting FAIR¹³⁹ and open data, the partnership should also contribute to the implementation of the European Health Data Space (EHDS)¹⁴⁰.

Thanks to its capacity to bring together different stakeholders (e.g. research funders, health authorities, citizens, healthcare providers, innovators, policymakers), the partnership will create a critical mass of resources to implement a long-term Strategic Research and Innovation Agenda (SRIA), based on the work of the Coordination and Support Action BrainHealth¹⁴¹.

The co-funded European Partnership for Brain Health should be implemented based on the priorities identified in the SRIA and through a joint programme of activities ranging from coordinating and funding transnational research to integrative activities aimed at structuring and enhancing the broader research and innovation ecosystem and facilitating the way research and innovation is carried out, and also delivering impact. Examples include (i) facilitating the sharing and analysis of data and samples, (ii) promoting harmonisation and standardisation efforts, (iii) providing input to shape the services provided by research infrastructures (based on the needs of the research community), as well as (iv) networking, training and dissemination activities.

It should be structured along the following main objectives:

¹³⁴ https://health.ec.europa.eu/publications/eu-non-communicable-diseases-ncds-initiative-guidance-document_en

¹³⁵ https://health.ec.europa.eu/publications/comprehensive-approach-mental-health_en

¹³⁶ https://health.ec.europa.eu/medicinal-products/pharmaceutical-strategy-europe_en

¹³⁷ <https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:32021R0522>

¹³⁸ <https://ec.europa.eu/social/main.jsp?langId=en&catId=89&furtherNews=yes&newsId=10382>

¹³⁹ See definition of FAIR data in the introduction to this work programme part.

¹⁴⁰ https://health.ec.europa.eu/ehealth-digital-health-and-care/european-health-data-space_en

¹⁴¹ <https://www.brainhealth-partnership.eu>

- Strengthening collaboration, strategic alignment and global dialogue: engage and collaborate with key stakeholders, not only those participating in existing EU-supported brain research initiatives but also beyond them, whilst also seeking alignment with these and international initiatives, including other European partnerships.
- Jointly supporting research and innovation: launch joint transnational calls underpinning the brain health research and innovation priorities, as defined in the SRIA, and based on annual work plans. Calls include research calls, networking calls, and those that relate to ethical, legal and social/societal aspects.
- Facilitating the use of infrastructures and platforms in the EU and Associated Countries: improve access to and use of these infrastructures and platforms (e.g. ECRIN¹⁴², EATRIS¹⁴³, EBRAINS¹⁴⁴, BBMRI¹⁴⁵, EuroBioImaging¹⁴⁶, European Genomic Data Infrastructure¹⁴⁷, etc.), whilst also providing input for shaping the services for the brain health research and funding community. This also covers the facilitation of data sharing by boosting FAIR and open data and improving interoperability and harmonisation.
- Bridging with healthcare providers, the private sector, regulators, and policymakers: enable the translation of research results into accessible, tailored products, technologies, interventions and policies through collaborations, including with institutionalised European partnerships (e.g., Innovative Health Initiative).
- Empowering citizens, people living with brain disorders and patients, families and caregivers (including informal): enable them to be active in their health trajectories via the dissemination of good practices and scientific outputs, as well as trainings to engage them along the whole spectrum of the research process.
- Capacity building in research: support networking and training of scientists, healthcare practitioners, health policy experts, innovators and other professionals contributing to preserve and improve brain health.

The partnership is open to all EU Member States, as well as to countries associated to Horizon Europe and will remain open to third countries wishing to join. Importantly, the EU contribution will not be increased should countries join after signing of the grant agreement.

The partnership should include or engage with the following actors: (i) Ministries in charge of R&I policy, as well as national and regional R&I and technology funding agencies and foundations; (ii) Ministries in charge of health and care policy, as well as national and regional healthcare authorities, organisations and providers; (iii) academic researchers; (iv) research infrastructures; (v) patients organisations; (vi) industry; (vii) research and technology organisations; (viii) private sector; and (ix) charities.

¹⁴² <https://ecrin.org>

¹⁴³ <https://eatris.eu>

¹⁴⁴ <https://www.ebrains.eu>

¹⁴⁵ <https://www.bbmri-eric.eu>

¹⁴⁶ <https://www.eurobioimaging.eu>

¹⁴⁷ <https://gdi.onemilliongenomes.eu>

The partnership may also encourage engagement with other relevant Ministries (e.g., related to employment, education, etc.) and research funders. It should involve other key actors from civil society and end-users, research and innovation community, innovation owners, health and care systems owners/organisers and health and care agencies.

The partnership should build on and go beyond existing and previous initiatives, including the ERA-NET actions under (i) the EU Joint Programme for Neurodegenerative Disease Research (JPND)¹⁴⁸, (ii) the Network of European Funding for Neuroscience Research (NEURON)¹⁴⁹, and (iii) the Human Brain Project¹⁵⁰ (HBP, a FET Flagship project), as well as the digital research infrastructure EBRAINS¹⁵¹, which was put in place by HBP, and the Coordination and Support Actions (CSAs) BrainHealth¹⁵² and European Brain Research Area (EBRA)¹⁵³.

The partnership's governance structure should engage upfront the relevant actors to coordinate, steer and frame the research and innovation activities, and facilitate the use and uptake of the results. The governance should involve key stakeholders, including but not limited to the research and innovation community, patients and citizens, health and care professionals, formal and informal care organisations, and innovation owners. Transparency in governance should be secured (e.g. in calls, governing bodies, etc.).

To ensure coherence and complementarity of activities and leverage knowledge and investment possibilities, the partnership is expected to establish relevant collaborations with other Horizon Europe partnerships (institutionalised and co-funded) and missions, as set out in the working document on 'Coherence and Synergies of candidate European Partnerships under Horizon Europe'¹⁵⁴, as well as to explore collaborations with other relevant activities at EU and international level. The proposal should also elaborate on possible synergies with other EU programmes, including EU4Health and the Digital Europe Programme (DIGITAL). The Partnership should align with EU-wide initiatives on open access and FAIR data, including the European Open Science Cloud (EOSC)¹⁵⁵.

To tackle the ambitious challenges, cooperation with international organisations, private sector and non-European institutions and experts may be considered. Participation of third countries is encouraged. Applicants should describe in their proposal the methodology for their collaboration and the aims they want to achieve with this kind of collaboration.

Proposals should pool the necessary financial resources from the participating national research programmes with a view to implementing joint calls for transnational proposals

¹⁵⁵ https://research-and-innovation.ec.europa.eu/strategy/strategy-2020-2024/our-digital-future/open-science/european-open-science-cloud-eosc_en

resulting in grants to third parties. Financial support provided by the participants to third parties is one of the activities of this action in order to be able to achieve its objectives.

When defining calls for proposals, this partnership needs to consider the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities. In addition, this partnership needs to integrate robust sex and gender considerations, applying an intersectional lens to investigate variations in mental, neurological and neurodegenerative conditions. This includes examining how characteristics such as sex, gender, age, racial/ethnic background, and disability intersect to influence disease/disorder prevalence, prevention, and outcomes.

The expected duration of the partnership is seven to ten years.

Projects funded by the European Partnership for Brain Health will be strongly encouraged to participate in networking and joint activities with relevant projects at European and national levels.

HORIZON-HLTH-2025-02-DISEASE-02: European partnership fostering a European Research Area (ERA) for health research (Phase 2)

Call: Partnerships in Health (2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 77.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 77.00 million.
<i>Type of Action</i>	Programme Co-fund Action
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The proposal must be submitted by the coordinator of the consortium funded under topic HORIZON-HLTH-2022-DISEASE-03-01: "European partnership fostering a European Research Area (ERA) for health research". This eligibility condition is without prejudice to the possibility to include additional partners.</p> <p>The proposed EU contribution of Phase 2 devoted to activities related to funding multi-country Investigator-Initiated Clinical Studies must be between 60% and 70% of the EU contribution of Phase 2.</p> <p>In recognition of the opening of the US National Institutes of Health's</p>

	programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding. Because the US contribution will be considered for the calculation of the EU contribution to the partnership, the concerned consortium of research funders from eligible EU Members States and Associated Countries must expressly agree to this participation.
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>If the proposal is successful, the next stage of the procedure will be grant agreement amendment preparations.</p> <p>If the outcome of amendment preparations is an award decision, the coordinator of the consortium funded under topic HORIZON-HLTH-2022-DISEASE-03-01: "European partnership fostering a European Research Area (ERA) for health research" will be invited to submit an amendment to the grant agreement, on behalf of the beneficiaries.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>This action is intended to be implemented in the form of an amendment of the grant agreement concluded pursuant to Article 24(2) of the Horizon Europe Regulation.</p> <p>For the additional activities covered by this action:</p> <ul style="list-style-type: none"> • The funding rate is 30% of the eligible costs. • Beneficiaries may provide financial support to third parties (FSTP). The support to third parties can only be provided in the form of grants. Financial support provided by the participants to third parties is one of the primary activities of this action in order to be able to achieve its objectives. Given the novelty of funding multi-country clinical studies which can result in different strategies being implemented (e.g. a few projects with relatively high budget per partner) and taking into consideration that clinical studies entail very high costs, the maximum amount to be granted to each third party is EUR 10.00 million for the duration of the partnership. However, if the objectives of the action would otherwise be impossible or overly difficult (and duly justified in

	<p>the proposal) the maximum amount may be higher.</p> <ul style="list-style-type: none"> • The starting date of the grant awarded under this topic may be as of the submission date of the application. Applicants must justify the need for a retroactive starting date in their application. Costs incurred from the starting date of the action may be considered eligible (and will be reflected in the entry into force date of the amendment to the grant agreement).
<i>Total indicative budget</i>	The total indicative budget for the duration of the co-funded Partnership is EUR 110 million.

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of Destination “Tackling diseases and reducing disease burden”. To that end, the proposal under this topic should aim to deliver results that are directed, tailored towards and contributing to all the following expected outcomes:

- Based on a trusted governance and effective working modalities, research funders, health policymakers and the research community work together in order to identify and prioritise topics of common interest and European benefit;
- Research funders and policymakers support the generation of knowledge related, but not limited, to cardiovascular diseases, prevention and public health, diet related diseases and nano medical technologies, and have access to and make use of the evidence on the benefits and drawbacks of health interventions, in particular for optimising clinical management, patient safety, personalised medicine (coordinating with the European Partnership for Personalised Medicine) and avoiding overtreatment;
- In addition to the well-established regular Joint Transnational Calls in the area of pre-clinical research, research funders and policymakers use the funding scheme developed in the Phase 1 of the European partnership fostering a European Research Area (ERA) for health research (ERA4Health) to support testing of health interventions in the clinical setting at European level. Therefore, the research community, independently from private interest, can conduct large-scale multi-country Investigator-Initiated Clinical Studies (IICSs)¹⁵⁶ of various health interventions addressing important public health needs in a seamless way, effectively addressing known challenges and obstacles related to, for example, appropriate study design, ethics (including special patient groups¹⁵⁷), regulatory and institutional approvals, patient recruitment, management of informed consent, as well as, biobanking of human samples;

¹⁵⁶ In this text, IICS means a clinical study in which a health technology (e.g. a medicinal product, a medical device, an *in vitro* diagnostic medical device, a surgical or other medical intervention) is tested in humans, independently from commercial interest and for public health benefits.

¹⁵⁷ The Pharmaceutical Strategy for Europe refers to including representative participation of population groups, for example gender and age groups, that are likely to use the medicinal product investigated in the clinical trials to ensure appropriate safety and efficacy.

- Public health research systems in the ERA are more effective and integrated. Utilisation of health services, preventative measures, technologies, tools and digital solutions are more cost-effective;
- Health and care authorities, policymakers and other stakeholders use the research results to develop evidence-based strategies and policies, and deploy good practices to European countries and regions;
- Patients and citizens are more knowledgeable about disease threats and contribute to a patient-centred decision-making process, assuring better adherence to knowledge-based disease management strategies and policies;
- Countries cooperate better and use context-specific knowledge and evidence to make their health and care systems more sustainable and resilient with respect to upcoming needs and crises (complementary with other current and future co-funded European Partnerships with which strong links will be established).

Scope: There is a need for health research at the EU and Associated Countries level to be more efficient in delivering safer, better and higher-quality solutions for prevention, detection, diagnosis, treatment, and management of diseases, as well as providing better and equal access and affordable healthcare systems to the citizens. Additionally, the high quality of evidence generated by the large multi-country clinical trials comparing to fragmented national or regional efforts confirmed the added value of multinational collaboration, supported by multinational funding schemes. In this regard, a European partnership proposing a new model for impactful multinational collaborations in funding health research is a key initiative to play a central role in addressing public health needs.

ERA4Health¹⁵⁸ - “Fostering a European Research Area for Health Research” - (Grant Agreement: 101095426) is a co-funded European Partnership in health research that aims to increase European transnational collaborative research funding by creating a funding body for joint programming in priority areas addressing European public health needs. It started in November 2022 and brings together 33 entities from 22 countries from the EU as well as Associated and Third countries. During Phase 1 (first 2 years), the main activities of the ERA4Health consortium were:

- organisation of 4 Joint Translational Calls (JTCs) focused on prevention and public health, nutrition and lifestyle-related diseases, cardiovascular diseases and nanomedicine;
- analysis of challenges and bottlenecks for investigator-initiated clinical research in the EU and Associated Countries, preparation of the supporting framework and a launch of a pilot JTC on multi-country IICS;

¹⁵⁸

<https://era4health.eu>

- developing collaboration on transversal activities, including for instance Responsible Research and Innovation guidelines, enhancing the ERA and health ecosystem, capacity building, patient safety, etc.

Taking into account that the present action is a continuation of the topic HORIZON-HLTH-2022-DISEASE-03-01 “European partnership fostering a European Research Area (ERA) for health research” and foresees an amendment to the existing grant agreement, the proposal should present the additional activities (including additional partners) to be covered by the award primarily in terms of grant agreement revisions.

The award of a grant to continue the Partnership in accordance with this call should be based on a proposal submitted by the coordinator of the consortium funded under HORIZON-HLTH-2022-DISEASE-03-01 “European partnership fostering a European Research Area (ERA) for health research” and the additional activities (which may include additional partners) to be funded by the grant should be subject to an evaluation. This evaluation should take into account the existing context and the scope of the initial evaluation as relevant, and related obligations enshrined in the grant agreement.

In this context, based on the funding scheme to support non-commercial clinical research developed during Phase 1, the main activities of the ERA4Health partnership in Phase 2 will mostly focus on additional JTCs on multi-country IICS in well-defined priority areas. In addition, the partnership’s activities initiated in Phase 1 will also be continued in Phase 2. The unique composition of the consortium gathering national funders with their competency and experience in funding health research, and links to respective ministries of research and/or health in their home countries or regions guarantees successful continuation of the current partnership via this non-competitive call under an Article 24(2) Horizon Europe Regulation action that allows for the addition of new activities to existing grant agreements (also including new additional partners where relevant).

Phase 2 will benefit from the already established effective governance mechanism to achieve the following additional objectives:

- Bringing together different stakeholders (e.g. research funders, health authorities, health and care institutions, innovators, policymakers), to update and implement the Partnership’s long-term Strategic Research and Innovation Agenda that should reflect more extended focus on multi-country IICS in the EU and Associated Countries.
- Using the novel funding mechanism developed during Phase 1, to enlarge the Partnership’s activities related to non-commercial clinical studies, including identification of specific topics, pooling of funding, and launching JTCs for EU- and Associated Countries-wide multi-country IICSs on various health interventions¹⁵⁹ addressing important public health needs.

¹⁵⁹ Wide definition of health intervention: medicinal products, medical devices, surgical or other invasive procedures, other medical interventions including preventative measures.

- To continue providing support and building capacity, in particular in conducting multi-country IICSs at European scale.

All types of clinical studies falling under the Clinical Trials Regulation (EU) 536/2014, including low-interventional trials (e.g. pragmatic trials to optimise treatment), may be supported by this Partnership. In particular, proposed multi-country IICSs should i) establish new indications of a given existing health intervention for conditions where alternative solutions do not exist or are sub-optimal (repurposing); ii) optimise or develop new, personalised care pathways (avoiding overlaps with activities of the European Partnership for Personalised Medicine¹⁶⁰); iii) support the development of new health interventions with clear relative clinical efficacy/effectiveness compared to existing alternatives (including preventative measures); iv) accelerate the uptake of new interventions by healthcare systems.

Support by European research infrastructures, required to perform multinational clinical studies at scale, will, in particular, build on the asset of existing research infrastructures, such as the European Clinical Research Infrastructure Network (ECRIN)¹⁶¹ for sponsor-delegated activities related to implementation of clinical studies, and Biobanking and Biomolecular Resources Research Infrastructure (BBMRI)¹⁶² for the management of biosamples and linked data that are generated under the studies.

Through pooling existing resources, eliminating redundancies and reducing fragmentation, the implementation of multi-country IICSs supported by this Partnership will benefit from better access to a high number of study participants/patients, medical expertise and facilities, enhanced methodological standards and shared costs, tools and procedures. Additionally, large-scale IICSs generate data on safety and effectiveness of a health intervention, often in real-world settings. They thus provide evidence to answer questions that clinicians face in their day-to-day practice in order to optimise the clinical management of patients beyond the context of marketing authorisation application for medicinal products. All these aspects will contribute to generate robust and reliable clinical evidence, increase the potential for broad implementation of research outcomes; prevent duplication of research efforts and allow broad uptake by health systems.

In the context of new activities of Phase 2, this Partnership will be open to public funders of health research at both national and regional levels in the Member States, countries associated to Horizon Europe and to other health research funders such as philanthropic organisations. Additional, special attention should be placed on inclusion or engagement with the following actors:

- Ministries in charge of R&I policy, as well as national and regional R&I and technology funding agencies and foundations;
- Ministries in charge of health and care policy, as well as national and regional health and care authorities, organisations and providers.

¹⁶⁰ <https://www.eppermed.eu>

¹⁶¹ <https://ecrin.org>

¹⁶² <https://www.bbmri-eric.eu>

The Partnership may also encourage engagement with other relevant Ministries and research funders. It will involve other key actors from civil society and end-users, research and innovation community, innovation owners, health and care systems owners/organisers and health and care agencies.

Cooperation with international organisations, and non-European institutions and experts may be considered. Participation of third countries is encouraged. The commitments to the partnership of entities not eligible for funding will not be counted towards the calculation of the EU funding to the partnership. Third country applicants should describe in their proposal the modalities for their collaboration and the aims they want to achieve with this kind of collaboration.

The proposal should pool the necessary financial resources from the participating research programmes with a view to implementing joint calls for transnational proposals resulting in grants to third parties. Financial support provided by the participants to third parties is one of the primary activities of this action in order to be able to achieve its objectives.

When defining calls for proposals, this partnership needs to consider sex and gender-related differences and it needs to consider the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

The expected duration of Phase 2 of the partnership should not exceed nine years.

Destination - Ensuring equal access to innovative, sustainable, and high-quality healthcare

Topics under this destination are directed towards the Key Strategic Orientation 2 “*The Digital transition*” and Key Strategic Orientation 3 “*A more resilient, competitive, inclusive, and democratic Europe*” of Horizon Europe’s strategic plan 2025-2027.

Research and Innovation supported under this destination should contribute to the following expected impact, set out in the strategic plan impact summary for the Health Cluster: *“healthcare systems provide equal access to innovative, sustainable and high-quality healthcare thanks to the development and uptake of safe, cost-effective and people-centred solutions. This is to be accompanied by management models focusing on population health, health systems resilience, and health equity and patient safety, and also improved evidence-informed health policies”*.

Health systems are affected by limitations in sustainability and resilience, challenges which were reinforced by the COVID-19 crisis that also revealed inequalities in access to high-quality healthcare services. Our health systems need to become more effective, efficient, accessible, fiscally and environmentally sustainable, and resilient in order to cope with public health emergencies, support healthcare workforce, adapt to environmental challenges like climate change, and contribute to social justice and cohesion. The transformation and modernisation of our health systems will remain an important challenge for many years to come, but it also holds a significant opportunity to generate evidence, leverage existing and emerging solutions, implement digital and data-driven innovation and develop more accessible, cost-effective, flexible and equitable health systems.

Research and Innovation under this destination aim to support healthcare systems in their transformation to ensure fair access to high-quality, sustainable healthcare for all citizens. Funded activities should develop innovative, practical, financially sound, and scalable solutions across various dimensions of healthcare systems. These activities should improve governance and provide decision-makers with new evidence, innovative tools and technologies while ensuring long-term fiscal, environmental and climate sustainability, making sure the health sector reduces its carbon footprint and supports sustainable use of resources. A patient-centred approach should be adopted to improve patients’ health outcomes, empower patients, foster active dialogue among stakeholders (e.g., citizens, patients, caregivers, healthcare providers), and encourage social innovation. Support to healthcare professionals and providers, with an adequate allocation of resources according to citizen’s needs and preferences, are key in these Research and Innovation actions.

Research and Innovation should help deliver solutions that are scalable and transferable between different types of healthcare systems in different national, regional, and local contexts. It should also provide knowledge that supports the transfer of solutions between countries, including measures to address health inequalities. Research and Innovation activities under this destination will contribute to, among other things, the European care

strategy¹⁶³, the digital transformation of health and care in the EU¹⁶⁴, the EU digital strategy, the EU Artificial Intelligence Strategy¹⁶⁵, the strategic investment framework in trustworthy Artificial Intelligence for the Union¹⁶⁶, the EU strategy on adaptation to climate change¹⁶⁷, and the European Green Deal. They can also build upon and contribute to the Europe's Beating Cancer Plan¹⁶⁸ and Cancer Mission under Horizon Europe.

In this work programme part, the focus of this destination will be on:

- Enhancing healthcare efficiency and cost-effectiveness with Generative Artificial Intelligence (AI) solutions, augmented by other AI tools that aim to support healthcare professionals in decision making, offer improved personalised care, and to develop sustainable practices, by leveraging the availability of the different types of health data.
- Improving patient engagement and empowerment by increasing public knowledge, trust and acceptance of AI tools, leading to better understanding of medical information and to improved patient outcomes, while also improving the communication between patients and healthcare providers, as well as between healthcare providers.

To increase the impact of EU investments under Horizon Europe, the European Commission encourages and supports cooperation among EU-funded projects to foster cross-fertilisation and synergies. This includes networking, joint activities such as workshops, knowledge exchange, best practices development, and joint communication activities. Synergies can be explored not only between projects funded under the same topic, but also between projects funded under other topics, Clusters or pillars of Horizon Europe. For instance, collaborations may arise between projects related to European health research infrastructures (under Pillar I), the EIC strategic challenges on health (under Pillar III), or across the Clusters of Pillar II such as Cluster 2 “Culture, Creativity and Inclusive Society” focusing e.g., on the long-term sustainability of public health systems (e.g., economic and organisational models and measures for cost effectiveness and fiscal sustainability), or Cluster 4 “Digital, Industry and Space” focusing on the digitalisation of the health sector, including the use of AI.

Expected impacts:

¹⁶³ Communication from the European Commission on the European care strategy, COM(2022) 440, 7.9.2022

¹⁶⁴ Communication from the European Commission on enabling the digital transformation of health and care in the Digital Single Market; empowering citizens and building a healthier society, COM(2018) 233, 25.4.2018

¹⁶⁸ Communication from the European Commission on Europe's Beating Cancer Plan, COM(2021) 44, 3.2.2021

Proposals for topics under this destination should set out a credible pathway to contributing to ensuring access to innovative, sustainable and high-quality healthcare, and more specifically to one or several of the following impacts:

- Health and social care services and systems have improved governance mechanisms, making them more effective, efficient, accessible, resilient, trusted and sustainable, both fiscally and environmentally. This includes shifting from hospital-centred to community-based, people-centred and integrated healthcare structures, embedding technological innovations and prioritising health promotion and disease prevention.
- Healthcare providers are trained and equipped with the skills and competences needed for future healthcare systems that are modernised, digitally transformed and equipped with safe innovative tools, technologies and digital solutions for healthcare. This will involve better patient management, improved patient engagement, reorganised workflows, and improved resource management.
- Citizens play a key role in managing their own healthcare, informal carers (including unpaid carers) are fully supported (e.g. by preventing overburdening and economic stress) and the specific needs of vulnerable groups are recognised and addressed. This includes improved access to healthcare services, financial risk protection, timely access to quality healthcare services including essential medicines and vaccines.
- Health policy and systems adopt a holistic approach - considering individuals, communities, organisations, society - in evaluating health outcomes, public health interventions, healthcare organisation, and decision-making. They benefit from evidence based, scalable and transferable healthcare solutions (e.g., between countries and healthcare settings) including for addressing health inequalities and ensuring environmental and climate sustainability in the health sector.

The actions resulting from the topics under this destination will also create strong opportunities for synergies with actions stemming from the EU4Health programme, in particular contributing to the goals under the general objective “*protecting people in the Union from serious cross-border threats to health*” and specific objective 4 “*to strengthen health systems, their resilience and resource efficiency*”.

The protection of European communication networks has been identified as an important security interest of the Union and its Member States. Entities that are assessed as high-risk suppliers¹⁶⁹ of mobile network communication equipment (and any entities they own or control) are not eligible to participate as beneficiaries, affiliated entities and associated partners to topics identified as “subject to restrictions for the protection of European

¹⁶⁹ Entities assessed as “high-risk suppliers”, are currently set out in the second report on Member States’ progress in implementing the EU toolbox on 5G cybersecurity of 2023 (NIS Cooperation Group, Second report on Member States’ progress in implementing the EU Toolbox on 5G Cybersecurity, June 2023) and the related Communication on the implementation of the 5G cybersecurity toolbox of 2023 (Communication from the Commission: Implementation of the 5G cybersecurity Toolbox, Brussels, 15.6.2023 C(2023) 4049 final).

communication networks”. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

Proposals are invited against the following topic(s):

HORIZON-HLTH-2025-01-CARE-01: End user-driven application of Generative Artificial Intelligence models in healthcare (GenAI4EU)

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 15.00 and 20.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health’s programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Ensuring equal access to innovative, sustainable, and high-quality healthcare”. To that end, proposals under this topic should aim to deliver results directed towards and contributing to all the following expected outcomes:

- Healthcare professionals, at all stages of healthcare provision, have access to user-centric, robust and trustworthy virtual assistant solutions based on Generative Artificial Intelligence (AI)¹⁷⁰ models and other AI tools to support them towards the provision of safer, more efficient and personalised care.
- Healthcare professionals benefit from cross-country applicable methodologies with the aim to facilitate acceptability, healthcare uptake and public trust of virtual assistant tools based on Generative AI models.
- Patients benefit from enhanced outcomes, more personalised care, and increased engagement with their healthcare professionals, leading to improved safety, quality of care, access to appropriate healthcare information and patient-doctor communication.
- Healthcare systems benefit from improved cost-effective patient outcomes, superior to standard of care in terms of accuracy, safety, and quality, and from cost-savings through advancements in highly accurate, transparent, traceable, and explainable solutions.

Scope: Healthcare professionals face important challenges related to efficiency, patient safety and provision of quality care with limited health systems' resources. Multimodality of health data combined with the available high-performance computing capabilities have the potential to empower effective and accurate use of trustworthy and ethical Generative AI-based solutions, augmented by other AI tools to address these challenges. Generative AI may benefit patients, healthcare professionals and health systems.

This topic will contribute to advancing and generating research to better understand and improve Generative AI-based virtual assistant solutions and their applicability in healthcare settings by improving patient health outcomes, fostering personalised healthcare and support the resilience, sustainability, and efficiency of the healthcare systems. In addition, the topic aims to also cover the understanding and mitigation of possible shortcomings (biases) and frameworks for monitoring and overseeing these solutions' use.

Research actions under this topic should include all the following activities, ensuring multidisciplinary approaches and a broad representation of stakeholders in the consortia (e.g. industry, academia, healthcare professionals, patients):

- Develop virtual assistant solutions based on new or optimised trustworthy and ethical Generative AI models, augmented by other AI tools to support healthcare professionals. The models should leverage extensive and diverse multimodal health and research data, public knowledge, and reliable healthcare systems information relevant for healthcare settings. Examples can include electronic health records, medical imaging, genomics, proteomics, molecular data, laboratory results, patient information (including on safety), and/or unstructured health data (the applicants may choose any type of available large-scale data). The development and training of the models should take place in

¹⁷⁰ Generative AI is a type of AI technology that can generate various forms of new content such as text, images, sounds, and even code, such as for programming or gene sequencing (<https://ec.europa.eu/newsroom/dae/redirection/document/101621>).

multinational consortia and federated governance approaches should be considered. The applicants should demonstrate how the project goes beyond combining existing data and generates new specific knowledge to improve clinical decision making.

- Demonstrate the added-value and clinical utility of the virtual assistant solutions in at least two healthcare use cases in different medical fields and unmet needs showing e.g. improved care management and efficiency, prediction of potential patient-specific therapeutic strategies and outcomes, etc. The applicants should provide evidence of high maturity technology for the use cases and assess the relative effectiveness of the solutions compared with standard of care, including on why these solutions would be superior to other AI tools and would deliver better outcomes. They should actively engage healthcare professionals as end users, and other stakeholders such as patients, caregivers in the development and testing of the solutions, ensuring that diverse perspectives and intersectional considerations are integrated throughout the process. Training and education activities for healthcare professionals should be organised.
- Develop a regulatory strategy/interaction plan with regulators (including in the area of Health Technology Assessment) for generating evidence, where relevant, in a timely manner. Consider also the potential for future regulatory impact of the results and sustainability aspects.
- Develop or adapt existing methodologies for continuous assessment of the developed solutions. The methodologies should demonstrate technical robustness, healthcare utility and trustworthiness of the Generative AI-based solutions, by adopting:
 - o Appropriate metrics for evaluating alignment with human values, ethical principles and the intended purposes of Generative AI models, performance including testing their technical robustness and clinical utility, as well as their model intelligibility, in view of ensuring AI trustworthiness¹⁷¹.
 - o Appropriate solutions to identify and mitigate potential bias¹⁷² of the models (e.g. representativeness of the data, bias of the trainer, bias of training and validation data, algorithmic discrimination and bias including gender bias etc.).
 - o Appropriate techniques to discover and demonstrate explainability of model reasoning, increase users' trust, and address the black box element, thus further enhancing transparency, model explainability and alignment.
 - o Methods to systematically address and assess ELSI (Ethical, Legal and Societal Implications), including data privacy concerns and risk of discrimination/bias (not limited to sex, gender, age, disability, race or ethnicity, religion, belief, minority

¹⁷¹ Ethics Guidelines for Trustworthy AI, published by the European Commission's High Level Expert Group on Artificial Intelligence: <https://ec.europa.eu/futurium/en/ai-alliance-consultation.1.html>

¹⁷² Guidelines on the responsible use of generative AI in research developed by the European Research Area Forum: https://research-and-innovation.ec.europa.eu/news/all-research-and-innovation-news/guidelines-responsible-use-generative-ai-research-developed-european-research-area-forum-2024-03-20_en

and/or vulnerable groups). The implication of medical errors originated from AI-assisted decision-making and the effects on potential legal liability for healthcare professionals should be explored.

All proposals should demonstrate EU added value by focusing on the development and/or use of trustworthy Generative AI models developed in the EU and Associated countries, involving in the consortium EU industrial developers, including leading-edge startups when possible. An open-source approach is encouraged when technically and economically feasible. Successful proposals are encouraged to utilise the resources offered by the AI factories¹⁷³, when relevant and in accordance with the specific access terms and conditions.

The proposals should adhere to the FAIR¹⁷⁴ data principles and apply GDPR¹⁷⁵ compliant processes for personal data protection based on good practices of the European research infrastructures, where relevant. The proposals should promote the highest standards of transparency and openness of models, as much as possible going well beyond documentation and extending to aspects such as assumptions, code and FAIR data management.

Proposals are encouraged to exploit potential synergies with the projects funded under the topic HORIZON-CL4-2021-HUMAN-01-24, as well as with other projects funded under Horizon Europe and Digital Europe Programmes. When the use cases are relevant to diseases covered by specific Horizon Europe Partnerships or missions (e.g., European Partnership on Rare Diseases, European Partnership on transforming health and care systems, the Cancer Mission, etc.), the proposals should adopt the federated data-management and data access recommendations already developed. Moreover, the applicants are encouraged to leverage available and emerging data infrastructures (e.g., European Health Data Space¹⁷⁶, European Genomic Data Infrastructure¹⁷⁷, Cancer Image Europe¹⁷⁸, European Open Science Cloud¹⁷⁹, EBRAINS¹⁸⁰ etc.), whenever relevant. Adopting EOSC recommendations and services for high-quality software is also encouraged. The expansion of health data and/or existing or under development AI infrastructures is not in the scope of this topic.

When possible, the developed models should be trained with multimodal data in different EU languages, to ensure accessibility and inclusivity.

Successful proposals are encouraged to utilise the resources offered by the AI factories¹⁸¹, when relevant and in accordance with the specific access terms and conditions.

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts and institutions as well as the inclusion of

¹⁷³ <https://digital-strategy.ec.europa.eu/en/policies/ai-factories>

¹⁸⁰ <https://www.ebrains.eu>

¹⁸¹ <https://digital-strategy.ec.europa.eu/en/policies/ai-factories>

relevant SSH expertise, to produce meaningful and significant effects enhancing the societal impact of the related research activities. The active engagement of healthcare professionals as end users, patients, and their caregivers is central to achieving targeted outcomes in the development and testing of the Generative AI virtual assistant solutions.

Proposals should consider the involvement of the European Commission's Joint Research Centre (JRC) based on its experience and with respect to the value it could bring in providing an effective interface between research activities and preliminary regulatory science as well as strategies and frameworks that address fit for regulatory requirements. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

All proposals selected for funding under this topic are strongly encouraged to collaborate, for example by participating in networking and joint activities, exchange of knowledge, developing and adopting best practices, as appropriate. Therefore, proposals are expected to include a budget covering the costs of any other potential joint activities without the prerequisite to detail concrete joint activities at this stage. The details of these joint activities will be defined during the grant agreement preparation phase.

Applicants envisaging to include clinical studies¹⁸² should provide details of their clinical studies in the dedicated annex using the template provided in the submission system.

¹⁸² Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

Destination - Developing and using new tools, technologies and digital solutions for a healthy society

Topics under this destination are directed towards the Key Strategic Orientation 2 “*The Digital Transition*” and Key Strategic Orientation 3 “*A More Resilient, Competitive, Inclusive, and Democratic Europe*” of Horizon Europe’s strategic plan 2025-2027.

Research and Innovation supported under this destination should contribute to the following expected impact, set out in the strategic plan impact summary for the Health Cluster: “*Health technologies, data, new tools, and digital solutions are applied effectively thanks to their inclusive, ethically sound, secure and sustainable delivery, integration and deployment in health policies and in health and care systems.*”

The Health Cluster will continue work to develop and stimulate the uptake of new technologies and digital solutions to improve healthcare and health systems. This includes using technology to help people better understand and use health information, promote healthier lifestyles, improve pandemic/epidemic preparedness, prevent diseases, provide better diagnoses and more personalised treatments and care solutions, and improve access to health and care systems while making sure that even groups with limited access to good healthcare can benefit. The Cluster will help the EU ensure leadership in breakthrough health and medical technologies and achieve open strategic autonomy in essential medical supplies and digital innovations. By collecting and analysing health data across borders and creating human-centred health technologies, including the use of Artificial Intelligence (AI), research can improve and personalise medical care for different patients, increasing patient safety and leading to better health outcomes and wellbeing.

Support for Research and Innovation is needed on the large spectrum of tools and technologies for biomedical research, prevention, diagnosis, therapy and health monitoring. This includes enabling technologies not least innovative biotechnological approaches. The emergence of the European Health Data Space will create an additional boost to cross-border, data-driven approaches and innovation, e.g. for personalised medicine or patient safety. High-quality health data (incl. real world data) combined with digital technologies, modelling and AI tools, have a high potential for advancing biomedical Research and Innovation. Emerging and disruptive technologies using tools like new genomic techniques and AI tools, offer big opportunities for transforming healthcare, but also depend on the capacity to collect, integrate and interpret large amounts of data and on their compatibility with appropriate regulatory frameworks. Such technologies can provide better and more cost-efficient solutions with high societal impact, tailored to the specific healthcare needs of the individual. However, novel tools, technologies and digital approaches face specific barriers and hurdles in piloting, implementing and scaling-up before reaching the patient, encountering additional challenges such as public acceptance and trust. The development and uptake of new technologies for high-quality healthcare will need to draw on multiple disciplines and require cross-sectoral cooperation among all those concerned, including end-users (patients, healthcare providers and workforce, researchers, regulatory bodies, policymakers, and funders). These interactions will help address unmet needs via integrated tools, hybrid health technologies and digital

solutions (including those with limited commercial interest). It will also support the design and development of health products and services tailored to the needs of specific population groups, thereby improving patient outcomes and reducing health inequalities.

This destination aims to promote the development of novel tools, technologies and digital solutions for prevention, diagnosis and therapy with the goal to improve health outcomes, while taking into consideration the rights of the individual, safety, effectiveness, appropriateness, accessibility, comparative value-added and fiscal sustainability as well as issues of ethical, legal and regulatory nature.

In this work programme part, Destination “*Developing and using new tools, technologies and digital solutions for a healthy society*” is driven by two key Commission policies, the “Biotechnology and Biomanufacturing Strategy”¹⁸³ and the “Artificial Intelligence Strategy”¹⁸⁴ and will focus on the development and use of innovative biotechnological tools for the improvement of the therapeutic arsenal of healthcare against diseases where there are currently no or only insufficient therapeutic strategies, on the development of Generative Artificial Intelligence models to help researchers in their activities to deliver new knowledge for advancing biomedical research and on the technology transfer of biotechnology-derived therapeutics from discovery to approved products. In particular, the topics under this destination will support activities aiming at: cellular and cell-free therapeutic approaches employing either genetic modifications or more classical techniques for improving the safety and therapeutic performance of these therapies, including their testing in clinical studies; development of generative AI models based on large-scale multi-modal health data for better understanding of diseases and their management thanks to the enhancement of biomedical discoveries and more personalised treatment solutions; bridging the gap between pre-clinical and clinical development stages of therapeutics developed through biotechnological methods and giving special emphasis on small and medium-sized enterprises (SMEs). In this context, specific attention is given to support the objectives of the Strategic Technologies for Europe Platform (STEP), adopted by the Commission in March 2024, which aims to boost investments in critical technologies in Europe (see introduction to this work programme part).

Under this destination, actions will support interdisciplinary Research and Innovation activities involving a broad spectrum of actors from different sectors, who will strive for the convergence of health technologies, combining medical technologies, pharmaceuticals, Advanced Therapy Medicinal Products (ATMPs) and digital health technologies, that will lead to integrated health solutions for the benefit of healthcare providers and patients.

In view of increasing the impact of EU investments under Horizon Europe, the European Commission welcomes and supports cooperation between EU-funded projects to enable cross-fertilisation and other synergies. This could range from networking to joint activities

¹⁸³ Commission Communication on Building the future with nature: Boosting Biotechnology and Biomanufacturing in the EU; COM(2024) 137 final: https://research-and-innovation.ec.europa.eu/document/download/47554adc-dffc-411b-8cd6-b52417514cb3_en

¹⁸⁴ Commission Communication on Artificial Intelligence for Europe; COM(2018) 237 final: <https://digital-strategy.ec.europa.eu/en/policies/european-approach-artificial-intelligence>; <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=COM:2018:237:FIN>

such as the participation in joint workshops, the exchange of knowledge, the development and adoption of best practices, or joint communication activities. Opportunities for such activities and potential synergies exist between projects funded under the same topic but also between other projects funded under another topic, Cluster or pillar of Horizon Europe (but also with ongoing projects funded under Horizon 2020). In particular, this could involve projects related to European health research infrastructures (under pillar I of Horizon Europe), the EIC strategic challenges on health, the European Innovation Ecosystems (EIE) interregional networks on health and EIT-KIC Health (under pillar III of Horizon Europe) or in areas cutting across the health and other Clusters (under pillar II of Horizon Europe), like, for instance, with Cluster 4 “Digital, Industry and Space” on digitalisation of the health sector or key enabling technologies.

Expected Impacts:

Proposals for topics under this destination should set out a credible pathway towards the development and use of new tools, technologies and digital solutions for a healthy society, and more specifically to one or several of the following impacts:

- Europe’s scientific and technological expertise and know-how, its capabilities for innovation in new tools, technologies and digital solutions, and its ability to take-up, scale-up and integrate innovation in healthcare is world-class.
- Citizens benefit from targeted and faster research resulting in safer, more sustainable, efficient, cost-effective and affordable tools, technologies and digital solutions for improved (personalised) disease prevention, diagnosis, treatment and monitoring for better patient outcome and wellbeing, in particular through increasingly shared health resources (interoperable data, infrastructure, expertise, citizen/patient driven co-creation)¹⁸⁵.
- The EU gains high visibility and leadership in terms of health technology development, including through international cooperation.
- The burden of diseases in the EU and worldwide is reduced through the development and integration of innovative diagnostic and therapeutic approaches, personalised medicine approaches, digital and other people-centred solutions for healthcare.
- Both the productivity of health Research and Innovation, and the quality and outcome of healthcare is improved thanks to the use of health data and innovative analytical tools, such as artificial intelligence (AI) supported decision-making, in a secure and ethical manner, respecting individual integrity and underpinned with public acceptance and trust.
- Citizens trust and support the opportunities offered by innovative technologies for healthcare, based on expected health outcomes and potential risks involved.

¹⁸⁵ Commission Communication on the digital transformation of health and care; COM(2018) 233 final

The protection of European communication networks has been identified as an important security interest of the Union and its Member States. Entities that are assessed as high-risk suppliers¹⁸⁶ of mobile network communication equipment (and any entities they own or control) are not eligible to participate as beneficiaries, affiliated entities and associated partners to topics identified as “subject to restrictions for the protection of European communication networks”. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

Proposals are invited against the following topic(s):

HORIZON-HLTH-2025-01-TOOL-01: Enhancing cell therapies with genomic techniques

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 8.00 and 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 50.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health’s programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	The criteria are described in General Annex D. The following exceptions

¹⁸⁶ Entities assessed as “high-risk suppliers”, are currently set out in the second report on Member States’ progress in implementing the EU toolbox on 5G cybersecurity of 2023 (NIS Cooperation Group, Second report on Member States’ progress in implementing the EU Toolbox on 5G Cybersecurity, June 2023) and the related Communication on the implementation of the 5G cybersecurity toolbox of 2023 (Communication from the Commission: Implementation of the 5G cybersecurity Toolbox, Brussels, 15.6.2023 C(2023) 4049 final).

	<p>apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>In order to ensure a balanced project portfolio with regard to the therapeutic area targeted¹⁸⁷, grants will be awarded (within available budget) to proposals not only in order of ranking but also in function of the highest ranked proposals in different therapeutic areas, provided that the applications attain all thresholds available.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Developing and using new tools, technologies and digital solutions for a healthy society”. To that end, proposals under this topic should aim to deliver results directed towards and contributing to several of the following expected outcomes:

- Biomedical scientists dispose of tools that allow them to engineer cells with specific therapeutic features.
- Improved methods and assays are available for biopharmaceutical developers.
- Clinicians will get access to innovative therapeutic approaches enabling them to treat conditions, where there are currently no or only insufficient therapeutic strategies.
- Cell engineering will be enriched and pave the way for novel personalised therapy options.

Scope: Therapies based on cells, stem cells or somatic cells, have been shown to be highly effective as therapeutics for a variety of health conditions. However, bottlenecks remain which currently hamper their safe and efficient application on a large scale. Genome- and epigenome editing have great potential to overcome some of these bottlenecks and to lead to the next-generation of cell-based therapies. Advancing the frontier of cell-based therapy with these tools and further translation of such research into clinically viable solutions may open up a new era of innovative therapies.

This topic aims at the design of engineered cells to address the current limitations of cellular therapies, such as delivery efficiency, patient safety, in vivo persistence, desired therapeutic effect, immune tolerance and manufacturing workflows. The chosen approach should enable to control the characteristics, fate and function of the engineered cells from gene level onwards and thus lead to customised cells with improved therapeutic features.

¹⁸⁷ Therapeutic area i to xi, as given in the scope of this topic.

The use of genetic engineering and in particular gene editing tools should be a key element in the design of the engineered cells. The therapeutic action should be based on the endogenous capabilities of the cells; the exogenous loading of cells with drugs (using the cells as drug carrier) is not in scope.

The engineered cells should be derived from human cells. Either stem cells or somatic cells may be used, but of allogeneic origin, thereby opening up the development of “off-the-shelf” cell therapeutics.

Applicants should explicitly state in their proposal which of the following therapeutic areas is targeted and the proposed work should address only this specific therapeutic area:

- i. Cancer and oncology
- ii. Nervous and sensory system
- iii. Cardiovascular and circulatory system
- iv. Endocrinology and metabolic system
- v. Musculoskeletal system
- vi. Digestive system
- vii. Infectious diseases
- viii. Respiratory system
- ix. Dermatology
- x. Immune system and auto-immune diseases
- xi. Other

The activities should comprise all the following elements:

- Engineering of synthetic genetic circuits acting as switches to modulate the desired function(s) and their integration in the chosen cells, with the help of new genomic techniques. Next to new genomic techniques like genome and epigenome editing, also synthetic biology introducing transgenes or artificial genes may be used to endow the engineered cells with improved therapeutic properties and achieve the desired cell phenotype. The applicants should use gene control systems, including transcriptional, translational and/or post-translational control, or other approaches which install on-off switches and control systems, like e.g. a “sense-and-respond” mechanism in the engineered cells, sometimes also referred to as “theranostic cells”.
- For the efficient construction and acceleration of the design-build-test cycles of the engineered cells containing the programmed functionalities state of the art tools including digital ones (e.g. Computer-Aided Design - CAD - and similar tools) should be used.

- Suitable *in-vitro* and *ex-vivo* systems should be used for testing and demonstration of function and performance of the engineered cells. Their added value, safety and efficacy should be ensured in appropriate pre-clinical models for one specific therapeutic area. Any disease, dysfunction or health impairment may be selected as therapeutic area.
- Applicants should show that the engineered cells are safe and exert the desired therapeutic effect *in-vivo*. Engagement and interaction with regulatory authorities during the project is essential for qualification of the developed cell-based therapy and in view of the conduct of clinical studies. The demonstration of the feasibility of the proposed cell-based therapy in first in-human studies would be an asset.

Sex differences should be taken into consideration, both with regard to the parent cells and for the targeted therapeutic application. Collaboration with relevant European research infrastructures and findings from EU-supported research projects should be considered. Participation of small and medium-sized enterprises (SMEs) is strongly encouraged.

Proposals should consider the involvement of the European Commission's Joint Research Centre (JRC) as a potential interface between research activities and pre-normative regulatory science and in relation to the potential validation of test methods fit for regulatory purpose. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

Applicants should provide details of their clinical studies¹⁸⁸ in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

HORIZON-HLTH-2025-01-TOOL-02: Advancing cell secretome-based therapies

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 9.00 and 13.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: In recognition of the opening of the US National Institutes of Health's

¹⁸⁸ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

	<p>programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Developing and using new tools, technologies and digital solutions for a healthy society”. To that end, proposals under this topic should aim to deliver results directed towards and contributing to several of the following expected outcomes:

- Researchers and biopharmaceutical developers work together with clinicians striving to translate innovative therapeutic approaches into healthcare solutions.
- Producers of innovative health technologies use standardised manufacturing processes.
- Healthcare providers get access to a new type of innovative therapies with demonstrated health benefits as compared to traditional treatments.
- Patients benefit from innovative therapies for conditions for which there are currently no or only insufficient therapeutic strategies.
- Health systems ultimately benefit from improved patient outcomes, superior to the current standard of care.

Scope: Secretome-based therapies have emerged as a promising alternative to cell-based therapies. The secretome of cells is defined as the repertoire of molecules and biological factors that are secreted into the extracellular space and has been shown to be a key factor for therapeutic activity due to its paracrine effects. The potential to manufacture, store and use secretome factors as off-the-shelf products, while maintaining the therapeutic benefits of cells but with fewer safety concerns, has placed the secretome at the forefront of regenerative medicine. Different cell secretomes or parts thereof have been the subject of clinical trials, but there is currently no regulatory-approved secretome-based therapy owing to several challenges. Currently, for the majority of secretome-based therapies, the main bottlenecks are: the incomplete understanding of their mode of action, their reproducibility due to a lack of standardised manufacturing processes and a lack of potency- and quality assurance assays.

Additional limitations are the characterisation of the bioactive factors and the optimisation of the delivery strategies.

Proposals submitted under this topic should tackle the above-mentioned issues and pave the way to secretome-based therapies that are safe, efficacious, and regulatory-approved for human use. The activities should cover secretomes or their parts that are derived from human cells and comprise all the following elements:

- The selection of a secretome-based therapy whose main mechanism of action has been elucidated in in-vitro and/or in-vivo models prior to the start of the proposed work. The selected secretome or its chosen bio-active components (extracellular vesicles, trophic factors, organelles, RNA, proteins, peptides, etc.), including those that are potentially harmful, should have been characterised and its/their therapeutic activity should already have been demonstrated in relevant pre-clinical models. All types of human cells may be used as underlying parent cells.
- All activities that are necessary to ensure regulatory and ethical approvals enabling the conduct of the clinical study. This may comprise the full characterisation, standardised analytical methods, further pre-clinical studies in relevant models (pertinent to the targeted disease or disorder) and appropriate quality assurance assays including computational approaches, organoids and organ-on chips/microfluidic systems.
- Establishment of a manufacturing protocol for the selected secretome or its components, including all the steps of the biogenesis: parent cells selection, their pre-conditioning and bio-processing (isolation, expansion, cultivation in bioreactors), processing of the conditioned media, the extraction of the secretome or its components (isolation, purification, storage, distribution) and its/their delivery to target site in the human body (mode of administration, final formulation).
- Definition of relevant quality criteria for and establishment of a fully GMP-conform¹⁸⁹ production process that enables to carry out clinical trials of the proposed secretome-based therapy.
- Carrying out of all the above-mentioned activities in close interaction with and in compliance with all requirements of the relevant competent authorities, allowing to perform clinical trials.
- Conduct of an interventional randomised controlled clinical trial comprising phase 1 and phase 2 to generate scientific evidence demonstrating safety and efficacy of the proposed secretome-based therapy.
- Applicants are expected to deliver no later than at month 12 of the project the documentation needed for the GMP-conform production (e.g. SOP - Standard Operating Procedures) and no later than at month 24 the documentation needed for the conduct of

¹⁸⁹ Good Manufacturing Practice (GMP): <https://www.who.int/teams/health-product-policy-and-standards/standards-and-specifications/gmp>

the clinical trial (e.g. IMPD¹⁹⁰), enabling to get the regulatory approval for the clinical trial. The overall goal is to perform and finalise the phase 1 and phase 2 clinical trials during the lifetime of the project and further achieve authorization of the proposed secretome-based therapy.

- Optionally and if essential for the chosen secretome-based therapy, the work should also include an engineering step of the secretome to achieve the desired profile for increased safety and improved therapeutic effect. To this end, the secretome or its bioactive component(s) may be modified either pre- or post-biogenesis, by use of classical methods on the parent cells, except their genetic modification, or by physico-chemical modification of the bio-active secretome component. The effected modifications of the secretome should lead to the improvement of the functional properties/features and/or of the delivery to target site (organ, tissue, etc.) for the bioactive secretome component. All these modifications should not alter the main mechanism of action and retain the proposed secretome-based therapy within the boundaries of substances of human origin¹⁹¹. The therapeutic effect of the secretome or its components should come from its/their endogenous capabilities and functionalities; exogenous loading with drugs (using the secretome or its components as drug carrier), be it pre- or post-biogenesis, is not in scope.

All types of diseases, dysfunctions or health impairments may be targeted, preference should be given to conditions that affect larger patient populations¹⁹² and/or represent a high burden on public health systems.

Sex differences should be taken into consideration, both with regard to the parent cells and for the targeted therapeutic application. Participation of small and medium-sized enterprises (SMEs) is strongly encouraged and if an exploitation strategy is developed, it should commit to a first deployment in the EU.

Proposals should consider the involvement of the European Commission's Joint Research Centre (JRC) as a potential interface between research activities and pre-normative regulatory science and in relation to the potential validation of test methods fit for regulatory purpose. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

Applicants should provide details of their clinical studies¹⁹³ in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

HORIZON-HLTH-2025-01-TOOL-03: Leveraging multimodal data to advance Generative Artificial Intelligence applicability in biomedical research (GenAI4EU)

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 15.00 and 17.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 50.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination "Developing and using new tools, technologies and digital solutions for a healthy society". To that end, proposals under this topic should aim to deliver results directed towards and contributing to all the following expected outcomes:

¹⁹³ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

- Researchers, including clinical researchers, have access to robust, trustworthy and ethical Generative Artificial Intelligence (AI)¹⁹⁴ models able to effectively advance biomedical research towards predictive and personalised medicine.
- Researchers, including clinical researchers, know how to use Generative AI models to synthesise the available scientific information and large-scale multimodal data and how to apply the necessary precautions, in order to deliver new knowledge and breakthrough scientific discoveries.
- Research community benefits from advanced methodologies to assess the validity and application of accurate, transparent, traceable, and explainable Generative AI models.

Scope: The availability of large-scale multimodal health data, scientific information, and novel Generative AI models, combined with high-performance computing capacities offer an unprecedented opportunity for researchers to achieve breakthroughs in our understanding of disease development and to develop new predictive models for disease management, personalised treatment solutions and personalised care pathways. The European Commission recognises this potential and considers health research and healthcare, among the priority sectors for building the Union's strategic leadership [COM(2024) 28 final].

This topic will contribute to advancing research and providing new evidence on how these models contribute to and support biomedical research and its applicability towards more predictive and personalised medicine, while also defining use conditions, usability requirements and training needs of the researchers. It aims to cover existing gaps related to Generative AI in biomedical research, addressing both capabilities and existing limitations.

Research actions under this topic should include all the following activities, ensuring multidisciplinary approaches and a broad representation of stakeholders in the consortia (e.g. industry, academia, healthcare professionals):

- Develop new or re-purpose existing Generative AI models for biomedical research across various medical fields and/or therapeutic indications. The models should be robust, based on the use of large-scale, complex, and multimodal high-quality data (real and/or synthetic data), such as but not limited to medical imaging, genomics, proteomics, other molecular data, electronic health records, laboratory results, unstructured health data and/or available scientific and public information relevant to biomedical research. The applicants may choose any type of available large-scale biomedical data and/or their combinations and justify their relevance for training and optimisation of the Generative AI tools.
- Develop a proof of concept with at least two use cases relevant for predictive and personalised medicine in different medical fields to demonstrate the scientific added value compared to currently used methods and/or potential future clinical utility of the

¹⁹⁴ Generative AI is a type of AI technology that can generate various forms of new content such as text, images, sounds, and even code, such as for programming or gene sequencing (<https://ec.europa.eu/newsroom/dae/redirection/document/101621>).

Generative AI models in biomedical research. The applicants should actively engage potential end users in the development, adaptation and testing of the new/repurposed models, considering sustainability aspects.

- Develop or revise existing methodologies to assess alignment with human values and the use cases of developed and/or repurposed Generative AI models, their applicability, performance, limitations and added value in biomedical research. These methodologies should demonstrate the technical, scientific, and potential future clinical utility, robustness and trustworthiness of the developed or repurposed Generative AI models, in particular:
 - o Appropriate performance metrics for continuous evaluation and testing of scientific, technical robustness and relevance of the Generative AI models, as well as risks from misalignment of training data (which may degrade performance, e.g. through including but not limited to hallucinations or confabulations of these models).
 - o Appropriate metrics for model intelligibility, robustness, alignment with ethical principles and approaches for ethical evaluation of AI trustworthiness¹⁹⁵.
 - o Appropriate solutions to identify and mitigate potential bias and confounding¹⁹⁶ of Generative AI models and include examples from different perspectives (e.g., representativeness of the data, bias of the trainer, bias of training and validation data, algorithmic discrimination and bias including gender bias etc.).
 - o Methods to systematically address and assess ELSI (Ethical, Legal, and Societal Implications) aspects, including data privacy, risk of discrimination/bias (not limited to sex, gender, age, disability, race or ethnicity, religion, belief, minority and/or vulnerable groups).
 - o Appropriate techniques to ensure explainability of the model in order to increase users' trust.
 - o Approaches and metrics (where feasible) for the usability of Generative AI models for researchers.

All proposals should demonstrate EU added value by developing and/or using trustworthy and ethical Generative AI models developed in the EU and Associated countries, involving in the consortium EU industrial developers of Generative AI solutions, including leading-edge startups when possible. An open-source approach is encouraged when technically and economically feasible.

¹⁹⁵ Ethics Guidelines for Trustworthy AI, published by the European Commission's High Level Expert Group on Artificial Intelligence: <https://ec.europa.eu/futurium/en/ai-alliance-consultation.1.html>

¹⁹⁶ Guidelines on the responsible use of Generative AI in research developed by the European Research Area Forum: https://research-and-innovation.ec.europa.eu/news/all-research-and-innovation-news/guidelines-responsible-use-generative-ai-research-developed-european-research-area-forum-2024-03-20_en

The proposals should adhere to the FAIR¹⁹⁷ data principles and apply GDPR¹⁹⁸ compliant processes for personal data protection based on good practices developed by the European research infrastructures, where relevant. The proposals should promote the highest standards of transparency and openness of models, as much as possible going well beyond documentation and extending to aspects such as assumptions, code and FAIR data management.

Proposals are encouraged to exploit potential synergies with other relevant projects funded under Horizon Europe and/or Digital Europe Programmes. When the use cases are relevant to diseases covered by specific Horizon Europe Partnerships or missions (e.g., the European Partnership on Rare Diseases, the Cancer Mission, etc.), the proposals should leverage the knowledge/data platforms already developed, such as the Virtual Platform of the European Joint Programme of Rare Diseases¹⁹⁹ etc. Moreover, the applicants are encouraged to leverage available and emerging European data infrastructures (e.g., the European Health Data Space²⁰⁰, European Genomic Data Infrastructure²⁰¹, Cancer Image Europe²⁰², European Open Science Cloud²⁰³, EBRAINS²⁰⁴ etc.), whenever relevant. In addition, adopting EOSC recommendations and services for high-quality software is also encouraged, if applicable. The creation and expansion of health data and/or AI infrastructures or large-data curation initiatives, existing or under development, are not in the scope of this topic.

This topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts and institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

Successful proposals are encouraged to utilise the resources offered by the AI factories²⁰⁵, when relevant and in accordance with the specific access terms and conditions.

Proposals should consider the involvement of the European Commission's Joint Research Centre (JRC) with respect to the value it could bring in providing an effective interface between research activities and pre-normative regulatory science as well as strategies and frameworks that address regulatory requirements. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

All proposals selected for funding under this topic are strongly encouraged to collaborate, for example by participating in networking and joint activities, exchange of knowledge,

¹⁹⁷ See definition of FAIR data in the introduction to this work programme part.

¹⁹⁸ General Data Protection Regulation: https://commission.europa.eu/law/law-topic/data-protection_en

²⁰⁵ <https://digital-strategy.ec.europa.eu/en/policies/ai-factories>

developing, and adopting best practices, as appropriate. Therefore, proposals are expected to include a budget for the attendance to regular joint meetings and may consider covering the costs of any other potential joint activities without the prerequisite to detail concrete joint activities at this stage. The details of these joint activities will be defined during the grant agreement preparation phase.

Applicants envisaging to include clinical studies²⁰⁶ should provide details of their clinical studies in the dedicated annex using the template provided in the submission system.

HORIZON-HLTH-2025-01-TOOL-05: Boosting the translation of biotech research into innovative health therapies

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 80.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to prove that the investigational product is ready for clinical testing, proposals must provide evidence of regulatory approval in the EU already in place for phase I clinical study.</p> <p>The proposed EU contribution going to small and medium-sized enterprises (SMEs) must be 50% or more of the total EU contribution to the project as a whole.</p> <p>In addition to the eligibility conditions as described in General Annex B, the consortium must be composed of at most 5 legal entities as beneficiaries.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	The criteria are described in General Annex D. The following exceptions apply:

²⁰⁶ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

	The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: Eligible proposals submitted under this topic and exceeding all the evaluation thresholds will be awarded a STEP Seal ²⁰⁷ .

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Developing and using new tools, technologies and digital solutions for a healthy society”. To that end, proposals under this topic should aim to deliver results directed towards and contributing to all the following expected outcomes:

- Healthcare providers, researchers and patients get faster access to innovative therapies.
- The European Union benefits from more clinical trials being conducted with new biotech therapeutic approaches.
- The competitiveness of small and medium-sized enterprises (SMEs) from the EU and Associated Countries within the health biotech sector is strengthened.

Scope: The Commission Communication *'Building the future with nature: Boosting Biotechnology and Biomanufacturing in the EU'* ²⁰⁸ has recently identified research and technology transfer to the market as a major challenge for the biotechnology sector. This topic aims to speed up the development of innovative biotechnology-based therapies by supporting the initial phases of clinical research. SMEs play a key role in the EU's potential to innovate, with most biotechnology-derived drugs in development being progressed by SMEs and small biotech companies. However, transitioning from drug discovery and development stages to approved products requires substantial investment and sufficient resources in different areas (e.g., manufacturing, clinical trial management, regulatory affairs, etc.), with the time needed for clinical development often exceeding 10 years ²⁰⁹. This topic targets collaborative multidisciplinary consortia of SMEs, academics, clinicians and research organisations bringing together the necessary expertise to launch the clinical development of novel biotechnology-derived therapeutics. Collaboration with the relevant European research infrastructures is encouraged. This topic does not address the full clinical development needed to bring products to market but aims to support the critical transition phase from preclinical to clinical development by supporting the early clinical phases. A non-exhaustive list of biotechnology-derived therapies in scope include monoclonal antibodies, (therapeutic) vaccines, recombinant biomolecules, Advanced Therapy Medicinal Products (ATMPs), nano-

²⁰⁷ https://strategic-technologies.europa.eu/about/step-seal_en

²⁰⁸ https://research-and-innovation.ec.europa.eu/document/download/47554adc-dffc-411b-8cd6-b52417514cb3_en

²⁰⁹ https://go.bio.org/rs/490-EHZ-999/images/ClinicalDevelopmentSuccessRates2011_2020.pdf

based drugs, RNA therapies etc. Whole blood, blood components and other substances of human origin are not within the scope of this topic.

Proposals submitted under this topic should include all the following elements:

- A Clinical study either phase I, II or I/II depending on the appropriate stage of development.
- The proposal should convincingly demonstrate a significant economic potential of the final product(s) for the Single Market.
- A clearly defined exploitation plan, with a detailed proposed route to commercialisation, description of the intellectual property ownership and benefit for the SME(s). The plan should include an anti-shelving strategy, commercial forecasts for the product sales & revenue, and strategies for follow-up financing as well as market authorisation. The exploitation strategy should envisage a first deployment in the EU.
- Justification of the patient populations that will benefit directly from the development of the therapies. Clinical indications where potentially large patient populations could benefit will be favoured.

The maximum project duration should not exceed four years.

Applicants should provide details of their clinical studies²¹⁰ in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

²¹⁰ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

Destination - Maintaining an innovative, sustainable, and competitive EU health industry

Topics under this destination are directed towards the Key Strategic Orientation 3 “*A more resilient, competitive, inclusive, and democratic Europe*” of Horizon Europe’s strategic plan 2025-2027. In addition, Key Strategic Orientation 2 “*The Digital Transition*” and Key Strategic Orientation 1 “*The Green Transition*” are supported.

Research and Innovation supported under this destination should contribute to the following expected impact, set out in the strategic plan impact summary for the Health Cluster: “*the EU health industry is innovative, sustainable, and globally competitive thanks to improved uptake of breakthrough technologies and innovations (including social innovations) that make the EU with its Member States and Associated Countries more resilient and less reliant on imports of critical health technologies*”.

The health industry is a key driver for growth and has the capacity to provide health technologies to the benefit of patients and providers of healthcare services. The relevant value chains involve a broad variety of key players from supply, demand and regulatory sides. In addition, the path of innovation in health is long and complex. The development of novel health technologies is generally associated with uncertainties and market barriers due to expensive and risky development (e.g., high attrition rate in pharmaceutical development), high quality and security requirements (e.g., clinical performance, safety, data privacy and cybersecurity) and market specificities (e.g., strong regulation, pricing and reimbursement issues). In addition, the growing concern about environmental issues is putting more pressure on this industry. Therefore, there is a need for Research and Innovation integrating various stakeholders to facilitate market access of innovative health technologies (medical technologies, pharmaceuticals, biotechnologies, digital health technologies).

In this work programme part, Destination “*Maintaining an innovative, sustainable and competitive EU health industry*” focuses on collaborative efforts to advance manufacturing processes and activities to ensure increased knowledge on and a faster uptake of medical devices and *in vitro* diagnostic medical devices in the current EU regulatory context. The results will support the EU Industrial Policy, with a focus on strengthening the resilience of the single market, addressing the EU’s strategic dependencies, gaining technological sovereignty and accelerating the green and digital transitions. In addition, the results will further strengthen the single market, by implementing the Digital Single Market strategy, providing evidence and guidelines for stakeholders and regulators to ensure take-up of innovations, supporting environmental, fiscal and socio-economic sustainability while fostering healthcare access and reducing health inequities. The results will also support the implementation of the Regulations on Medical Devices (MDR) and *In Vitro* Medical Devices (IVDR) and the Pharmaceutical Strategy for Europe, especially aspects related to the importance of ensuring industry competitiveness, innovation and sustainability and the development of high quality, safe, effective, and greener medicines.

In view of increasing the impact of EU investments under Horizon Europe, the European Commission welcomes and supports cooperation between EU-funded projects to enable

cross-fertilisation and other synergies. This could range from networking to joint activities such as the participation in joint workshops, the exchange of knowledge, development and adoption of best practices, or joint communication activities. All topics are open to international collaboration to address global environment and health challenges.

In particular, the topics under this destination will support activities aiming at: i) optimising the manufacturing of Advanced Therapy Medicinal Products (ATMPs) with the ultimate aim that healthcare providers, researchers and patients get faster access to ATMPs with demonstrated health benefits for unmet medical needs; ii) advance digitalisation of conformity assessment procedures in the context of medical device and *in vitro* diagnostic medical device development; iii) facilitating and enabling improved knowledge on the conduct of multinational clinical studies of orphan devices and/or highly innovative (“breakthrough”) devices.

Expected impacts:

Proposals for topics under this destination should set out a credible pathway to contributing to maintaining an innovative, sustainable and competitive EU health industry, and more specifically to one or several of the following expected impacts:

- Health industry in Europe and Associated Countries is more competitive and sustainable, assuring European leadership in breakthrough health technologies and open strategic autonomy in essential medical supplies and (digital) technologies, contributing to job creation and economic growth, in particular with small and medium-sized enterprises (SMEs).
- Health industry is supported by cross-sectoral Research and Innovation in the context of convergence of health technologies (integrating medical technologies, pharmaceuticals, biotechnologies, digital health, and e-health technologies) while strengthening key market positions.
- Health industry is working more efficiently along the value chain from the identification of needs to the scale-up and take-up of solutions at national, regional or local level, including through early engagement with patients, healthcare providers, health authorities and regulators ensuring suitability and acceptance of solutions.
- Citizens, healthcare providers and health systems benefit from a swift uptake of innovative health technologies and services through the provision of evidence and guidelines for stakeholders, policymakers and regulators. These efforts offer significant improvements in health outcomes, also potentially strengthening access to healthcare for all and reducing health inequities while health industry benefits from decreased time-to-market.
- Citizens, healthcare providers and health systems benefit from increased health security in Europe and Associated Countries due to reliable access to key manufacturing

capacity, including timely provision of essential medical supplies and technologies of particularly complex or critical supply and distribution chains.

Legal entities established in China are not eligible to participate in Innovation Actions in any capacity. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

The protection of European communication networks has been identified as an important security interest of the Union and its Member States. Entities that are assessed as high-risk suppliers²¹¹ of mobile network communication equipment (and any entities they own or control) are not eligible to participate as beneficiaries, affiliated entities and associated partners to topics identified as “subject to restrictions for the protection of European communication networks”. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

Proposals are invited against the following topic(s):

HORIZON-HLTH-2025-01-IND-01: Optimising the manufacturing of Advanced Therapy Medicinal Products (ATMPs)

Call: Cluster 1 - Health (Single stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health’s programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation</p>

²¹¹ Entities assessed as “high-risk suppliers”, are currently set out in the second report on Member States’ progress in implementing the EU toolbox on 5G cybersecurity of 2023 (NIS Cooperation Group, Second report on Member States’ progress in implementing the EU Toolbox on 5G Cybersecurity, June 2023) and the related Communication on the implementation of the 5G cybersecurity toolbox of 2023 (Communication from the Commission: Implementation of the 5G cybersecurity Toolbox, Brussels, 15.6.2023 C(2023) 4049 final).

	and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).
<i>Award criteria</i>	The criteria are described in General Annex D. The following exceptions apply: The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ²¹² .

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Maintaining an innovative, sustainable, and competitive EU health industry”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to most of the following expected outcomes:

- Academic and industrial developers advance processes that support the timely and robust development of Advanced Therapy Medicinal Products (ATMPs);
- Manufacturers integrate improved technologies/processes (including Artificial Intelligence solutions), analytic tools, methods including non-clinical methods and assays for more flexible manufacturing of ATMPs;
- Healthcare providers, researchers and patients get faster access to ATMPs with demonstrated health benefits for unmet medical needs;
- Companies in the EU and Associated countries get a better market position in the field of ATMP manufacturing and improve their knowledge on how to advance process improvements;

²¹² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- The EU and Associated countries lay the foundations for academic centres of excellence²¹³ in ATMPs.

Scope: New pioneering treatments called Advanced Therapy Medicinal Products (ATMPs)²¹⁴, including cell and gene therapies, are at the cutting edge of medicines discovery. Owing to their precise nature, ATMPs embody personalised medicine and reflect a shift in medicine towards potentially one-time curative therapies instead of chronic therapies that mainly cure the symptoms but not the underlying cause of diseases.

ATMPs have undergone important technological advancements that are improving their efficacy, precision, scalability, and safety. Additionally, the disease focus of ATMPs is likely to shift further from rare diseases to more common conditions with larger patient populations. However, the development and manufacturing of ATMPs still faces important challenges, such as long development times, expensive manufacturing processes and a fragmented and dispersed biomanufacturing landscape.

The topic focuses on addressing the challenges of ATMP manufacturing, the need for highly specialised equipment and facilities, including in-process quality control and validation tests, scaling up and batch-to-batch reproducibility, whilst maintaining the efficacy of an ATMP product during the manufacturing process and/or the transition from centralised to decentralised manufacturing.

This topic aims to optimise the ATMP production where the general manufacturing process for a given medicinal product has already been established but has not been sufficiently optimised for its scale-up. Collaboration is crucial to refine the manufacturing of ATMPs, emphasising advancements in processes - including leveraging the potential of digital tools and advanced sensors -, fostering standardisation and enhancing quality controls for more efficient production and deployment of these innovative therapies, ideally covering the entire manufacturing lifecycle.

The proposals should address all the following activities for only one chosen category of ATMP as defined by Regulation 1394/2007 per proposal:

- Design an improved manufacturing process for ATMPs by:
 - o Exploring the potential of platform technologies in manufacturing, quality control, non-clinical or clinical testing;
 - o Integrating either computational modelling, automation, robotics or digital/Artificial Intelligence solutions with meaningful and measurable impact;

²¹³ A centre of excellence refers to a team with a clear focus on a particular area of research; such a centre may bring together faculty members from different disciplines and provide shared facilities.

²¹⁴ ATMPs as classified by the European Medicines Agency (EMA): <https://www.ema.europa.eu/en/human-regulatory-overview/advanced-therapy-medicinal-products-overview>

- Verify the improved performance of the developed process, in comparison to established ones.
- Demonstrate a reduction in the timeframe and costs of manufacturing while maintaining product quality and standardisation.
- Demonstrate the translatability, scalability, and robustness of the process suitable for the flexible manufacturing (centralised or decentralised) and deployment of ATMPs by important stakeholders in a patient-centric manner, including the medical community and hospitals.
- Assess the process and methods developed for their regulatory validity and utility (for example standardised assays including for potency), taking into consideration the potential regulatory impact of the results and, as relevant, develop a regulatory strategy for generating appropriate evidence as well as engaging with regulators in a timely manner.
- Promote green and sustainable industrial production and minimise environmental impact.

Participation of small and medium-sized enterprises (SMEs) is strongly encouraged and proposals should include a commitment for first deployment in the EU.

Where relevant, proposals are warmly invited to liaise with the Coordination and Support Action (CSA) project JOIN4ATMP²¹⁵, in view of creating complementarities and potential synergies.

The Joint Research Centre (JRC) may participate as a member of the consortium selected for funding. Proposals should consider the involvement of the European Commission's JRC regarding its experience in this field and with respect to the value it could bring in providing an effective interface between research activities and pre-normative science as well as strategies and frameworks that address regulatory requirements. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

Applicants envisaging to include clinical studies²¹⁶ should provide details of their clinical studies in the dedicated annex using the template provided in the submission system.

HORIZON-HLTH-2025-01-IND-02: Digitalisation of conformity assessment procedures of medical devices and in vitro diagnostic medical devices

Call: Cluster 1 - Health (Single stage - 2025)

²¹⁵ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/how-to-participate/org-details/999999999/project/101137206/program/43108390/details>,
<https://cordis.europa.eu/project/id/101137206>

²¹⁶ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 4.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, legal entities established in the United States of America may exceptionally participate as a beneficiary or affiliated entity, and are eligible to receive Union funding.</p> <p>Coordinators of projects must be legal entities established in an EU Member State or Associated Country.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ²¹⁷.</p>

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Maintaining an innovative, sustainable, and competitive EU health industry”. To that end, proposals under this topic should aim to deliver

²¹⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

results that are directed, tailored towards and contributing to all the following expected outcomes:

- Notified Bodies (NBs), device²¹⁸ developers and manufacturers adopt digitalisation in their conformity assessment procedures thus facilitating device development. As certain steps of conformity assessment do also require involvement of regulatory authorities (e.g. consultation of medicines authorities), digitalisation of these steps would also bring relevant benefit;
- Device developers and manufacturers have access to digitalised conformity assessment procedures. These procedures will become more efficient, less onerous, and more predictable, which will reduce costs and shorten the time to market access;
- Device developers and manufacturers, in particular small and medium-sized enterprises (SMEs), can direct a larger part of their resources towards the research and development of innovative devices.

Scope: The regulations on Medical Devices (MDR) and *In Vitro* Diagnostic Medical Devices (IVDR) have introduced stricter regulatory requirements in view of ensuring a high level of patient safety and public health. The implementation of the new regulatory requirements still remains a challenge for manufacturers. SMEs face particular challenges as they have limited resources to adapt to the new framework. One of the main issues reported by manufacturers is the complexity and perceived unpredictability of the conformity assessment procedure involving a Notified Body.

The Medical Device Coordination Group (MDCG) assists the Commission and the Member States in ensuring a harmonised implementation of the MDR and IVDR, notably through the development of guidance and templates. Notably, the conformity assessment procedures are still based on continuous exchange of highly complex technical documentation in an electronic format (e.g., pdf or excel files) between the key actors of NBs and manufacturers, requiring several iterations between them. Further digitalisation of this process (from document to data-driven processes) can bring greater efficiency, accuracy, and transparency and lead to a more predictable and harmonised assessment process. This is expected to reduce the administrative burden as well as certification timelines and facilitate the conformity assessment procedure for manufacturers, particularly SMEs. In turn, this will contribute to maintaining the EU as a business-friendly environment for all manufacturers, which will ultimately benefit patients. For example, digitalisation can lead to simplification through the reduction of administrative burden, use of a single-entry point for all exchange of information. If relevant, applicants may liaise with an ongoing study on supporting the monitoring of the availability of medical devices in the EU market²¹⁹. Potential improvements related to digitalisation can include pre-defining mandatory data elements, the possibility of getting

²¹⁸ For the purpose of this topic, the reference to ‘devices’ includes both medical devices and *in vitro* diagnostic medical devices, unless otherwise specified.

²¹⁹ Study commissioned by the European Commission’s Directorate-General for Health and Food Safety via the European Health and Digital Executive Agency (results not yet published): https://health.ec.europa.eu/study-supporting-monitoring-availability-medical-devices-eu-market_en

alerts on whether data is complete, the identification of missing parts and inconsistencies and a reduction of error rates in this regard. Overall improved communication would be anticipated with digitalisation.

Any actions as part of the proposal will be performed under the current regulatory framework and will not involve changing MDR/IVDR requirements. Proposals should present a major step towards digitalisation in Europe and Associated Countries. Governance of a potential IT infrastructure developed in Europe and Associated Countries is outside the scope of the topic.

The proposals should cover all the following points:

- all steps of the MDR/IVDR procedures, from manufacturer's preparation of technical documentation and other pre-application activities for certification to issuance of a MDR/IVDR certificate by a NB;
- all actors involved in the conformity assessment procedure, including manufacturers, NBs, EU reference laboratories, expert panels of medical devices, as well as agencies involved in the consultation activities;
- a good representation of different NBs, including representation from small and large NBs, public and private NBs and a representative mix focusing on medical devices and *in vitro* diagnostic medical devices. The proposal should put a strong focus on consensus building activities between the different stakeholders involved.

The proposals should address all the following activities:

- Feasibility study
 - o Review existing initiatives aimed at digitalising MDR/IVDR conformity assessment procedures, or part thereof, and investigate digitalisation of conformity assessment/approval procedures for devices in other jurisdictions (e.g., US Food and Drug Administration). Consider lessons learned from digitalising conformity assessment procedures in other areas than medical devices.
 - o Examine basic processes/workflows established by individual NBs.
 - o Identify main steps of the conformity assessment procedure to be digitalised, actors involved, and essential elements and requirements to be considered prior to digitalisation.
 - o Collect and analyse feedback from main stakeholders on challenges and feasibility of the digitalisation process, identify interoperability with existing workflows used by manufacturers and/or NBs.
 - o Determine technical specifications required for the digitalisation as well as the possible options regarding digital transformation platforms.

- o Analyse facilitating factors, main challenges, possible solutions and required resources.
- Pilot
 - o Develop a pilot for the whole or part of the MDR/IVDR conformity assessment procedure, including Key Performance Indicators (KPI). This will involve collaboration with relevant stakeholders, including NBs, manufacturers, the European Commission and other involved parties.
 - o Develop a dedicated platform to run the pilot or identify an existing platform suitable for the pilot.
- Roadmap towards digitalisation
 - o Based on the lessons learned from the pilot, identify different steps to scale-up the pilot in order to digitalise MDR/IVDR conformity assessment procedures, or part of them. Identify associated challenges and possible solutions to address these.
 - o Present a roadmap to the piloted approach, including possible alternatives, covering actors involved and resources needed.

HORIZON-HLTH-2025-03-IND-03-two-stage: Facilitating the conduct of multinational clinical studies of orphan devices and/or of highly innovative (“breakthrough”) devices

Call: Cluster 1 - Health (Two stage - 2025)	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants submitting a proposal under the blind evaluation pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply:

	<p>In recognition of the opening of the US National Institutes of Health's programmes to European researchers, any legal entity established in the United States of America is eligible to receive Union funding.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>
<i>Award criteria</i>	<p>The criteria are described in General Annex D. The following exceptions apply:</p> <p>For the first stage, the thresholds for each criterion will be 4 (Excellence) and 4 (Impact). The overall threshold applying to the sum of the two individual scores will be set at a level that ensures the total requested budget of proposals admitted to stage 2 is as close as possible to four times the available budget, and not less than three and a half times the available budget.</p> <p>For the second stage, the thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ²²⁰.</p>

²²⁰

This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: This topic aims at supporting activities that are enabling or contributing to one or several expected impacts of destination “Maintaining an innovative, sustainable, and competitive EU health industry”. To that end, proposals under this topic should aim to deliver results that are directed, tailored towards and contributing to all the following expected outcomes:

- Healthcare providers increase their hands-on experience regarding the clinical use of orphan devices²²¹ and/or of highly innovative (“breakthrough”) devices and get timely access to such devices with demonstrated clinical benefits;
- Developers and manufacturers collect and obtain scientific evidence on their proposed intervention/ approach with the device under investigation;
- Patients benefit from the development, studies and use of orphan devices and/or of highly innovative (“breakthrough”) devices;
- Companies in the EU and associated countries get a better market position in this field and improve their knowledge on how to conduct multinational clinical studies for these devices.

Scope: The focus of this topic is on multinational clinical studies²²² of orphan devices²²³ and/or of highly innovative (“breakthrough”) devices, including digital and Artificial Intelligence (AI) based tools and techniques.

The emphasis within rare disease research and innovation has predominantly centred on pharmaceuticals, leaving a noticeable gap in the support for developing orphan devices. Orphan devices are specifically intended for use in rare diseases or conditions or in specific indications for rare cohorts of patients with an otherwise non-rare disease or condition. As, by their nature, orphan devices are intended for use in a small number of individuals each year, often infants and children, generating clinical data within an appropriate period of time and conducting clinical investigations is especially challenging due to low patient recruitment volumes.

Besides orphan devices, also highly innovative (“breakthrough”) devices are in the scope of this topic if they are expected to provide major clinical benefits for the treatment, diagnosis or

²²¹ For the purpose of this topic, the reference to ‘devices’ includes both medical devices and *in vitro* diagnostic medical devices, unless otherwise specified.

²²² See definition of clinical studies in the introduction to this work programme part.

²²³ A device should be regarded as an ‘orphan device’, if it meets the following criteria: i) the device is specifically intended to benefit patients in the treatment, diagnosis, or prevention of a disease or condition that presents in not more than 12.000 individuals in the European Union per year and ii) at least one of the following criteria are met:

- there is insufficiency of available alternative options for the treatment, diagnosis, or prevention of this disease/condition, or
- the device will offer an option that will provide an expected clinical benefit compared to available alternatives or state of the art for the treatment, diagnosis, or prevention of this disease/condition, taking into account both device and patient population-specific factors. MDCG 2024-10 Guidance on clinical evaluation of orphan medical devices: https://health.ec.europa.eu/document/download/daa1fc59-9d2c-4e82-878e-d6fdf12ecd1a_en?filename=mdcg_2024-10_en.pdf.

prevention of a life threatening, seriously debilitating or serious and chronic disease or condition, regardless of whether they target small patient populations. Highly innovative (“breakthrough”) devices²²⁴ aim to address unmet medical needs. ‘Unmet medical needs’ should be understood as a condition for which there exists no satisfactory method of diagnosis, prevention or treatment in the EU or, even if such a method exists, in relation to which the device concerned will be of major advantage to those affected²²⁵. Those may include devices using digital tools and AI based technologies.

Developers of such devices often face challenges to generate clinical data in the pre-market phase in a timely manner.

Time and cost of clinical data collection can adversely affect public health by significantly delaying the availability of devices needed to treat or diagnose rare diseases or conditions or that may improve patient care or public health. Many devices are used off-label to respond to this unmet need. Nonetheless, a high level of clinical evidence based on thorough clinical data is needed to ensure patient safety.

Clinical development strategies for implementing multinational clinical studies have the potential to offer improved efficiency and to reach larger patient samples. Challenges may arise from the potential uncertainty regarding how regional disparities in regulatory, clinical, business, ethical and cultural practices may affect study design, conduct, data interpretation and various other outcomes.

This topic targets those challenges by supporting multinational studies aiming to gather pre- or post-market clinical data to demonstrate the device’s safety and performance (including determination of any undesirable side-effects and their acceptability when weighed against the expected clinical benefits).

The proposals should demonstrate that they address all the following activities for a device that is an orphan device or a highly innovative “breakthrough” device (or both), at any point of the pre- or post-market stage, including the development stage, with the overall purpose to generate data in support of CE marking under the Regulations on medical devices (MDR) or *in vitro* diagnostic medical devices (IVDR):

- Design and conduct multinational clinical studies in a minimum of two different countries in the EU or Associated Countries, with a focus on orphan devices and/or highly innovative (“breakthrough”) devices, with a view to demonstrate the safety and clinical performance of the device(s) subject to the study.
- Present a sound clinical study feasibility plan, including an appropriate patient selection and realistic recruitment plans at different sites, justified by scientific publications or

²²⁴ See Appendix 8 to MEDDEV 2.7/1 revision 4 (<https://ec.europa.eu/docsroom/documents/17522/attachments/1/translations>) or the FDA’s Breakthrough Devices Program (<https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program>).

²²⁵ Based on Article 4(2) of Commission Regulation 507/2006 which defines the term ‘unmet medical needs’ in the field of medicinal products.

preliminary results. Proposals should adopt a gender-sensitive and intersectional approach, considering individual characteristics such as gender, sex, race, ethnicity, disability and age. Additionally, socioeconomic, lifestyle and behavioural factors should be taken into account. For this, the topic requires the effective contribution of social sciences and humanities (SSH) disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

- Demonstrate potential clinical benefit²²⁶ for patients and healthcare providers, including quality of life and consideration of patient-reported outcomes when relevant.
- Involve patients, patient organisations, carers and healthcare professionals in the design of the clinical studies.
- Identify, collect and record relevant good practices and experiences related to the design, conduct, sample handling, data analysis and results reporting of multinational clinical studies. In addition, provide appropriate recommendations and lessons learned.
- For multinational clinical studies, authorisation for the study approval by more than one national competent authority may be necessary. Develop a regulatory strategy and interaction plan for generating appropriate evidence as well as engaging with regulators and other relevant bodies (e.g., European Medicines Agency (EMA), EMA expert panels²²⁷, national regulators, Health Technology Assessment bodies, etc.) in a timely manner. Consider also the potential for future regulatory impact of the results.

Proposals may include multiple devices, but the minimum expected is one device.

Participation of small and medium-sized enterprises (SMEs) is strongly encouraged.

For orphan devices or highly innovative devices relevant to rare disease patients, applicants should look for complementarities and potential synergies with actions implemented under ERDERA²²⁸ the co-funded European Partnership on Rare Diseases proposed under Horizon Europe²²⁹, as well as synergies with actions implemented under the EU4Health programme.

The Joint Research Centre (JRC) may participate as a member of the consortium selected for funding. Proposals should consider the involvement of the European Commission's JRC regarding its experience in this field and with respect to the value it could bring in providing

²²⁶ 'Clinical benefit' is defined in the Medical Device Regulation (EU) 2017/745, Article 2(53) as follows: Clinical benefit means the positive impact of a device on the health of an individual, expressed in terms of a meaningful, measurable, patient-relevant clinical outcome(s), including outcome(s) related to diagnosis, or a positive impact on patient management or public health.

²²⁷ EMA pilots scientific advice for certain high-risk medical devices - European Medicines Agency (EMA): <https://www.ema.europa.eu/en/news/ema-pilots-scientific-advice-certain-high-risk-medical-devices>

²²⁸ 'European Rare Diseases Research Alliance', <https://cordis.europa.eu/project/id/101156595>

²²⁹ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/opportunities/topic-details/horizon-hlth-2023-disease-07-01>

an effective interface between research activities and pre-normative science as well as strategies and frameworks that address regulatory requirements. In that respect, the JRC will consider collaborating with any successful proposal and this collaboration, when relevant, should be established after the proposal's approval.

Applicants should provide details of their clinical studies²³⁰ in the dedicated annex using the template provided in the submission system. As proposals under this topic are expected to include clinical studies, the use of the template is strongly encouraged.

²³⁰ Please note that the definition of clinical studies (see introduction to this work programme part) is broad and it is recommended that you review it thoroughly before submitting your application.

Other Actions not subject to calls for proposals

Grants to identified beneficiaries

1. Grant to the Global Alliance for Chronic Diseases (GACD)

Expected Outcome: Proposals should set out a credible pathway to contributing to one or several expected impacts of destination “Tackling diseases and reducing disease burden”.

Project results are expected to contribute to the following expected outcome: enable the European Commission to take part in GACD²³¹, which brings together leading health research funding agencies of key countries (currently Australia, Brazil, Canada, India, Japan, New Zealand, South Africa, Thailand, UK and USA) to coordinate research activities addressing on a global scale the prevention and treatment of chronic, non-communicable diseases such as cardiovascular diseases, diabetes, mental and neurological diseases, lung diseases and cancer.

Scope: Recommendations of GACD are expected to have a fundamental value for future orientation of public health research policy. This will also contribute to the implementation of the Union’s strategy for international cooperation in research and innovation.

Award criteria:

The criteria are described in General Annex D. The following exceptions apply: The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.

Procedure:

The evaluation committee will be composed fully by representatives of EU institutions.

Legal and financial set-up of the Grant Agreements:

Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025)²³².

The funding rate will be 100%.

Legal entities:

GACD Action, Wellcome Building, 215 Euston Road, London NW1 2BE, United Kingdom

²³¹ <https://www.gacd.org>

²³² This decision is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Form of Funding: Grants not subject to calls for proposals

Type of Action: Grant to identified beneficiary according to Financial Regulation Article 198(e) - Coordination and support action

The general conditions, including admissibility conditions, eligibility conditions, award criteria, evaluation and award procedure, legal and financial set-up for grants, financial and operational capacity and exclusion, and procedure are provided in parts A to G of the General Annexes.

Indicative timetable: Fourth Quarter of 2025

Indicative budget: EUR 0.60 million from the 2025 budget

2. Presidency event - Cyprus. Advancement of Treatments for Rare Diseases

This action will cover the organisation of a high-level conference by the Cypriote presidency on the advancement of treatments for Rare Diseases within the EU.

Rare Diseases (RDs), often called orphan diseases, are a large (>7000) and diverse group of disorders that collectively pose a substantial disease burden and affect approximately 30 million people in the EU. The proposed conference should align with the goal of making Europe a world leader in RD research and innovation, addressing the challenges faced by patients with RDs and improving their access to effective treatments and care across Europe. It should aim to engage stakeholders in the RD community to support concrete health benefits to patients through the development of innovative treatments.

The conference should be informed by key EU initiatives on RDs both on healthcare and research sides, such as:

- The European Reference Networks (ERNs)²³³, their registries, their Joint Action JARDIN²³⁴ (all funded under the EU4Health programme) and their clinical research coordination platform ERICA²³⁵ (funded under Horizon 2020).
- The Horizon Europe European Partnership on Rare Diseases, namely the European Rare Diseases Research Alliance (ERDERA)²³⁶, and its predecessor the European Joint Program co-fund on Rare Diseases (EJP RD)²³⁷.
- The European Platform on Rare Disease Registration (EU RD Platform)²³⁸.

²³³ https://health.ec.europa.eu/rare-diseases-and-european-reference-networks/european-reference-networks_en

²³⁴ <https://jardin-ern.eu>

²³⁵ <https://cordis.europa.eu/project/id/964908>, <https://erica-rd.eu>

²³⁶ <https://cordis.europa.eu/project/id/101156595>, <https://erdera.org>

²³⁷ <https://cordis.europa.eu/project/id/825575>, <https://www.ejprarediseases.org>

²³⁸ https://eu-rd-platform.jrc.ec.europa.eu/_en

- Public-private projects under the Innovative Health Initiative (IHI) such as Conect4Children²³⁹ (pan-European collaborative pediatric network for high quality clinical trials in children), Screen4Care²⁴⁰ and RealiseD.
- EU policies and regulations to incentivise the development of orphan drugs, the encouragement of member states to develop national plans and strategies for treatment of RD.

The conference should aim to address the following goals:

- Raise national profiles, for example by leveraging tools offered by the ERDERA Partnership and enhance awareness, knowledge exchange, collaboration and coordination between stakeholders in RD treatments.
- Promote innovation and research that accelerates the translation of scientific findings into new therapies as well as repurposing of already approved drugs for RDs.
- Explore ways to improve the regulatory framework for the approval and equity of access to orphan drugs, ensuring that safe and effective treatments reach patients across all member states.
- Discuss potential solutions to enhance data security, sharing and infrastructure for research and treatment of RDs, recognising the critical role of big data in advancing medical knowledge, enabling AI-based solutions and improving patient outcomes.

The conference should aim to engage with a diverse audience across sectors and disciplines, including representatives from national political, health and research authorities; national research funding agencies; private investors; patients and advocacy groups; EU institutions and agencies; healthcare providers, clinicians and researchers. Participants should also include representatives from pharmaceutical and biotechnology companies and from regulatory bodies such as the European Medicines Agency (EMA), technology and data specialists, Non-Governmental Organisations (NGOs), media professionals, health technology assessment (HTA) experts, legal and ethical experts.

The inclusion of these key stakeholders should ensure the relevance and actionability of the conference's conclusions which are expected to be summarised in a report. This report should provide a comprehensive framework for addressing the challenges and opportunities related to RDs in Europe.

Award criteria:

The criteria are described in General Annex D. The following exceptions apply: The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.

²³⁹ <https://cordis.europa.eu/project/id/777389>, <https://conect4children.org>

²⁴⁰ <https://cordis.europa.eu/project/id/101034427>, <https://www.screen4care.eu>

Procedure:

The evaluation committee will be composed fully by representatives of EU institutions.

Legal and financial set-up of the Grant Agreements:

Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025)²⁴¹.

The funding rate will be 100%.

Subcontracting is not restricted to a limited part of the action.

Legal entities:

The Cyprus Institute of Neurology and Genetics, 6 Iroon Avenue, 2371 Nicosia, Cyprus

Form of Funding: Grants not subject to calls for proposals

Type of Action: Grant to identified beneficiary according to Financial Regulation Article 198(e) - Coordination and support action

The general conditions, including admissibility conditions, eligibility conditions, award criteria, evaluation and award procedure, legal and financial set-up for grants, financial and operational capacity and exclusion, and procedure are provided in parts A to G of the General Annexes.

Indicative timetable: Second Semester of 2025

Indicative budget: EUR 0.30 million from the 2025 budget

3. Supporting European and global efforts to sustain the global biodata ecosystem

Expected Outcome:

Results under this action are expected to contribute to all the following expected outcomes:

- Promote dialogue, exchange and strategic cooperation among public and private research funders in the EU and globally to ensure the long-term sustainability of and access to a robust and open biodata ecosystem for life sciences R&I.

²⁴¹ This decision is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Enhance knowledge and expertise on global biodata resources, including through analysis on their quality, utility, reliability, interoperability and cost, that would enable funders to make informed decisions about supporting these resources.

The action is expected to contribute to enhanced sustainability of and access to global biodata resources, thus advancing groundbreaking scientific research and innovation with the aim to solving global health challenges.

Scope:

This action continues and builds on an international initiative supporting the long-term sustainability of and access to key biodata resources for life sciences R&I, as executed through an organisation named the Global Biodata Coalition. The experience from this initiative underlines the continued need for global coordination to support and protect the fragile and vulnerable ecosystem of biodata resources that are essential for life sciences, including the ongoing and growing need to enhance the quality, reliability, interoperability and accessibility of biodata. In this context, the proposal should address:

- The establishment of a secretariat supporting the work needed for the achievement of this objective, including through the identification of (and interaction with) global biodata resources. The secretariat provides activities which inform and support the funding community about how best to ensure the health and well-being of the global biodata ecosystem, including providing technical advice and expertise to strengthen institutional and administrative capacity to accelerate financial support for the planning, development and implementation of biodata resources.
- The establishment of a governance framework and the creation of a fora for discussion of strategic funding priorities and strategic decision-making to ensure long-term support and sustainability of the global biodata ecosystem.

The work of the secretariat and governance framework should address global and European needs in biodata sustainability, taking into account specific contexts. The Secretariat will advocate and promote awareness of global ethical and data standards and principles arising from relevant international, European and national law.

It is expected that the proposal has a period of implementation of at least five years.

Award criteria:

The criteria are described in General Annex D. The following exceptions apply: The thresholds for each criterion will be 4 (Excellence), 4 (Impact) and 4 (Implementation). The cumulative threshold will be 12.

Legal and financial set-up of the Grant Agreements:

Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the

Research and Training Programme of the European Atomic Energy Community (2021-2025)²⁴².

The funding rate will be 100%.

Subcontracting is not restricted to a limited part of the action.

Legal entities:

EMBL - European Molecular Biology Laboratory, Meyerhofstrasse 1, 69117, Heidelberg, Germany

Form of Funding: Grants not subject to calls for proposals

Type of Action: Grant to identified beneficiary according to Financial Regulation Article 198(e) - Coordination and support action

The general conditions, including admissibility conditions, eligibility conditions, award criteria, evaluation and award procedure, legal and financial set-up for grants, financial and operational capacity and exclusion, and procedure are provided in parts A to G of the General Annexes.

Indicative timetable: Second Semester of 2025

Indicative budget: EUR 5.00 million from the 2025 budget

Other Instruments

1. Studies, conferences, events and outreach activities

A number of specific contracts will be signed in order to: (i) support the dissemination and exploitation of project results; (ii) contribute to the definition of future challenge priorities; (iii) undertake citizen surveys such as Eurobarometers; (iv) carry out specific evaluations of programme parts; (v) support future European Research Area (ERA) policy actions; and (vi) organise conferences, events and outreach activities.

Subject matter of the contracts envisaged: studies, technical assistance, conferences, events and outreach activities.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: 2025

Indicative budget: EUR 1.37 million from the 2025 budget

²⁴² This decision is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

2. Subscription to the Human Frontier Science Program Organization

An annual subscription to the international Human Frontier Science Program Organization (HFSP)²⁴³ will allow researchers from EU non-G7 Member States to fully benefit from the Human Frontier Science Program (HFSP), enable initiatives to help the affected scientific community in and from areas recently severely ravaged by conflict and/or war on European ground and contribute to the implementation of the Global Approach to Research and Innovation, Europe's strategy for international cooperation in a changing world²⁴⁴.

Type of Action: Subscription action

Indicative timetable: Second Quarter of 2025

Indicative budget: EUR 6.92 million from the 2025 budget

3. External expertise in relation to EU research and innovation policy issues

This action will support the provision of independent expertise in support of the assessment, design, implementation, evaluation and valorisation of EU research and innovation policies in the areas currently in scope of the Health Cluster.

Individual experts will work on tasks such as, but not limited to: portfolio analysis of projects funded under Horizon Europe or previous European research and innovation programmes; analysis of the contribution of research results (at national, EU and/or international level) to EU policy objectives and emerging issues, including policy recommendations; analysis of the state-of-the-art at European and international level; participation in studies, conferences, events, symposia, etc, including the drafting of papers and reports on their conclusions; assistance for setting-up a research and innovation strategy for selected domains; policy recommendations and options assisting Commission services in elaborating evidence-based and scientifically sound policy proposals; assistance in the evaluation of calls for expression of interest; advice on the valorisation, communication, dissemination and exploitation of research results; identification of innovative solutions as well as potential gaps and synergies to be addressed by EU research and innovation policy; advise on promising technologies covered by European and nationally funded projects and on ways to stimulate synergies, etc.

In addition to individual experts, this action could provide for Commission expert groups.

A special allowance of maximum EUR 450/day will be paid to the experts appointed in their personal capacity who act independently and in the public interest.

Form of Funding: Other budget implementation instruments

Type of Action: Expert contract action

²⁴³ The European Commission is a member of the HFSP Organization (HFSP) and has funded HFSP under previous Framework Programmes

²⁴⁴ Communication from the Commission on the Global Approach to Research and Innovation. Europe's strategy for international cooperation in a changing world, COM(2021) 252, 18.5.2021 (<https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=COM%3A2021%3A252%3AFIN>).

Indicative budget: EUR 0.10 million from the 2025 budget

Horizon Europe
Work Programme 2025

5. Culture, Creativity and Inclusive Society

IMPORTANT NOTICE:

This draft has not been adopted or endorsed by the European Commission. Any views expressed are the views of the Commission services and may not in any circumstances be regarded as stating an official position of the Commission.

This draft is made public before the adoption of the work programme to provide potential participants with the currently expected main lines of this work programme. Only the adopted work programme will have legal value.

The adoption of the work programme will be announced on the Horizon Europe website and on the Funding and Tenders Portal.

Information and topic descriptions indicated in this draft may not appear in the final work programme; and likewise, new elements may be introduced at a later stage. Any information disclosed by any other party shall not be construed as having been endorsed by or affiliated to the Commission.

The Commission expressly disclaims liability for any future changes of the content of this document.

Introduction

Cluster 2, 'Culture, Creativity and Inclusive Society' aims to meet EU goals and priorities on enhancing democratic governance and citizens participation, on the safeguarding and promotion of cultural heritage, and to respond to and shape multifaceted social, economic, technological and cultural transformations. Cluster 2 mobilises multidisciplinary expertise of European social sciences and humanities (SSH) for understanding fundamental contemporary transformations of society, economy, politics and culture. It aims to provide evidence-based policy options for a socially just and inclusive European green and digital transition and recovery.

The EU is strongly committed to the UN Sustainable Development Goals (SDGs), many of which have an important impact on culture, creativity, and inclusive society, notably: SDG 1 (No poverty), SDG 3 (Good Health and Well-being), SDG 4 (Quality Education), SDG 5 (Gender Equality), SDG 8 (Decent Work and Economic Growth), SDG 10 (Reduced Inequalities), SDG 11 (Sustainable Cities and Communities), SDG 12 (Responsible Consumption and Production), and SDG 16 (Peace, Justice, and Strong Institutions), with their specific targets to achieve a better and more sustainable future for all.

Proposals are invited against the following three (3) destinations:

Activities contributing to the **destination "Innovative Research on Democracy and Governance"**, will provide knowledge, data and scientifically robust recommendations to reinvigorate and defend democratic governance and improve trust in democratic institutions. In the long-term, this will contribute to help safeguard fundamental rights to empower active and inclusive citizenship. By doing so, they will also strengthen accountability, transparency, effectiveness and trustworthiness of rule of law-based institutions and policies. Activities will help address an increasing number of threats from both internal and external actors, notably those who use harming methods enabled by digital technologies and social media. They will focus on tackling increased hatred, disinformation, information manipulation, and foreign interference, as well as the polarisation of political debate. The fight against radicalisation and extremism will be a priority, alongside efforts to combat social isolation caused by online group dynamics and addressing algorithmic bias. Combating antisemitism and minority discrimination will be essential to building a more inclusive and equitable society.

Activities contributing to the **destination "Innovative Research on the European Cultural Heritage and the Cultural and Creative Industries"**, will support research and innovation to boost sustainable growth and job creation through the cultural and creative industries. R&I actions will promote artificial intelligence for creativity and innovation, better access and engagement with cultural heritage and improve its protection, enhancement and restoration. A new European partnership for Resilient Cultural Heritage will be launched, and support for the European Collaborative Cloud for Cultural Heritage will be continued.

At the same time, through the **destination "Innovative Research on Social and Economic Transformations"**, actions will help tackle social, economic and political inequalities,

support human capital development and contribute to a comprehensive European strategy for inclusive growth. Activities will improve the understanding of how technological, climate, economic and demographic changes impact society. They will inform the design of policies addressing existing and emerging challenges, harnessing new opportunities (particularly in the areas of employment, education, mental health and well-being) and contributing to reaching the objectives set out by the Action Plan of the European Pillar of Social Rights. A key focus of the activities will be to boost sustainability and inclusion, by supporting vulnerable groups and protecting individuals from discrimination (based on sex, gender, racial or ethnic origin, religion or belief, disability, age or sexual orientation).

Horizon Europe is the research and innovation programme in a system of European and national funding programmes which share policy objectives. Through the programme, special attention will be given to ensuring cooperation between universities, scientific communities and industry, including small and medium enterprises, and citizens and their representatives, to bridge gaps between territories, generations and regional cultures, especially caring for the needs of the young in shaping Europe's future. Funded projects could be EU Synergies grants, meaning that as such, they have the possibility to also receive funding under other EU programmes. To enable synergies by design in this context, project proposers should consider and actively seek strategic combinations with, and where appropriate possibilities for further funding from, other R&I-relevant EU, national or regional and cross-border programmes (such as ERDF including Interreg, ESF+, JTF, EMFF, EAFRD and InvestEU), as well as private funds or financial instruments.

The EU's Recovery and Resilience Facility (RRF) aims at financing projects that directly tackle the economic and social impacts from the Coronavirus crisis and support the green and digital transition. For project ideas that directly contribute to these objectives and that have a strong focus in one Member State it is advisable to check access to the RRF for a fast and targeted support.

Synergies with relevant Union programmes will be sought, regarding the take-up of research results and innovative solutions developed under Horizon Europe, for example via the following programmes:

- Creative Europe: it improves the safeguarding and valorisation of cultural heritage and further supports the cultural and creative sector. Creative Europe can improve sectorial networking and cooperation of Member States and non-EU Participating Countries in the Creative Europe Programme¹ to apply the latest technologies, stimulate new scientific approaches and boost innovation potential stemming from Horizon Europe.
- Erasmus+: it supports efforts to efficiently use the potential of Europe's talent and social assets in a lifelong learning perspective throughout the education, training and youth fields. It promotes measures for the inclusion of people with fewer opportunities, including newly arrived migrants, and supports skills development and citizens' participation and engagement, encouraging young people to engage and learn to

¹ [list-3rd-country-participation_crea_en.pdf \(europa.eu\)](#)

participate in civic society and democratic life, raising awareness about EU values, including via online platforms and tools for virtual cooperation. As regards Cluster 2, Erasmus+ projects could benefit for instance from the use of innovative practices for migrant integration in education, up-take of innovative methods for citizen engagement and education for fostering EU values and democracy stemming from Horizon Europe.

- Global Europe, the EU's Neighbourhood, Development and International Cooperation Instrument: it supports and consolidates democracy, rule of law and human rights, supports civil society organisations outside the EU, furthers stability and peace and addresses other global challenges including migration and mobility. The actions can benefit from drawing on the findings of H2020 and Horizon Europe projects regarding trust in governance, tackling disinformation and citizens' participation and engagement.
- Digital Europe Programme (DIGITAL): while Horizon Europe supports research and development of digital technologies, DIGITAL supports the wide uptake and deployment of innovative digital solutions in areas of public interest (including public administration, justice and education), by setting up and making accessible Europe-wide data spaces and platforms and providing SMEs and public administrations access to the latest digital technologies, for example via Digital Innovation Hubs. Priority actions for the first four years of DIGITAL include "Safer internet for kids", a "Platform for combating disinformation", supporting the EU language technology industry in developing and deploying latest AI-based technologies in all EU languages, contributing to the skills and employment of ICT professionals (including women and girls) and the EU digital platform for cultural heritage, Europeana, which supports the digital transformation of cultural heritage institutions.
- Technical Support Instrument (TSI): by supporting the efforts of the national authorities in improving their administrative capacity to design, develop and implement reforms, the TSI can benefit from the good practices, innovative processes and methodologies identified or developed in H2020 and Horizon Europe projects, and get access to the expertise in research bodies participating to such projects.
- Citizens, Equality, Rights and Values programme: the programme can draw on the results of H2020 and Horizon Europe projects in the field of citizens' engagement, to support civil society organisations in encouraging and facilitating active participation in the construction of a more democratic Union and awareness raising of EU rights and values.
- European Social Fund Plus (ESF+): The programme aims to promote social cohesion and equip people with the skills needed for the evolving demands of the labour market. Member States and regions can use the ESF+ to mainstream and upscale innovative technologies and solutions in the areas of employment, social inclusion, education and training, including successful models and practices developed under Horizon 2020 and Horizon Europe. In addition, the ESF+ can support operations and researchers granted a Seal of Excellence under Horizon Europe.

- European Regional Development Fund: ERDF focuses, among others, on the development and strengthening of regional and local research and innovation ecosystems and smart economic transformation, in line with regional/national smart specialisation strategies. It can support investment in research infrastructures, activities for applied research and innovation (including industrial research), experimental development and feasibility studies, building research and innovation capacities and the uptake of advanced technologies and roll-out of innovative solutions from the Framework Programmes for research and innovation through the ERDF. It helps governments reap the benefits of digitisation and encourages investments in social and cultural infrastructure, the development of cultural services and the conservation of cultural heritage. Interreg is a main instrument of ERDF to support cooperation across regions and countries. Support to the protection and development of cultural heritage, to SMEs, to social innovation in culture and creative industries is central to Interreg. Interreg can also complement Horizon Europe's initiatives by supporting policy learning and regional cooperation.
- European Agricultural Fund for Rural Development (EAFRD): relevant stakeholders can benefit from the dissemination and take-up of R&I results in the field of cultural heritage, in particular in rural and remote areas.
- The InvestEU Programme can fund the uptake of R&I results related to Cultural and Creative Industries (CCI) and cultural heritage.
- The Asylum, Migration and Integration Fund (AMIF) supports the EU migration policy to strengthen and develop all aspects of the common European asylum system, support legal migration to the Member States and effective integration policies. It contributes to countering irregular migration. Horizon Europe contributes to the implementation of the AMIF providing an evidence base for policies and projects, as regards asylum protection, legal and irregular migration management and migrant integration.

To increase the impact of EU investments under Horizon Europe, the European Commission encourages collaboration between EU-funded projects to build on complementarities through networking, joint workshops, knowledge exchange, best practices, and joint communication activities. Complementarities can be explored between projects funded under the same or different topics, Clusters or pillars of Horizon Europe. This includes collaborations between projects funded under Cluster 1 and Cluster 2 for complementary actions, such as promoting social inclusion, health equity (including gender equality and support for marginalised groups), and mental health initiatives in education, work, and daily life (including through culture and the arts). The cross-cluster complementarities are set out in detail in the Strategic Plan of Horizon Europe for 2025-2027.

In line with the EU's Global Approach to Research and Innovation, and as for the Work Programmes of 2021-2022 and 2023-2025, the Work Programme 2025 will remain almost completely open to the participation of non-associated third countries to all Research and Innovation Action (RIA) and Innovation Action (IA) topics. In support of the Global Gateway

Strategy², projects involving international partners should lead to increased scientific knowledge and transfer of technology among partner countries allowing to address global challenges across the world and create sustainable growth and jobs. Cooperation should take place in a value-based way, creating linkages, not dependencies

The topics in this cluster require the effective and extensive contribution of SSH disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, to produce meaningful and significant effects enhancing the societal impact of the related research activities.

CALL

Call - Culture, Creativity and Inclusive Society - 2025

HORIZON-CL2-2025-01

Overview of this call³

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ⁴	Indicative number of projects expected to be funded
		2025		
Opening: 15 May 2025 Deadline(s): 16 Sep 2025				
Destination Innovative Research on Democracy and Governance				
HORIZON-CL2-2025-01-DEMOCRACY-01: Advisory support and network to counter disinformation and foreign information manipulation and interference (FIMI)	CSA	3.50	3.00 to 3.50	1
HORIZON-CL2-2025-01-DEMOCRACY-02: Fostering the consolidation of European science diplomacy	CSA	3.00	2.50 to 3.00	1
HORIZON-CL2-2025-01-DEMOCRACY-03: Preparing the EU for future enlargement: challenges and opportunities	RIA	10.50	3.00 to 3.50	3
HORIZON-CL2-2025-01-DEMOCRACY-04: Open strategic autonomy, economic and research security in EU foreign policy	RIA	7.00	3.00 to 3.50	2

³ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.

The Director-General responsible may delay the deadline(s) by up to two months.

All deadlines are at 17.00.00 Brussels local time.

The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

⁴ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

General conditions relating to this call	
<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and exclusion</i>	The criteria are described in General Annex C.
<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

Call - Culture, Creativity and Inclusive Society - 2025 - Two-stage

HORIZON-CL2-2025-02-TWO-STAGE

Overview of this call⁵

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ⁶	Indicative number of projects expected to be funded
		2025		
Opening: 15 May 2025				
Deadline(s): 16 Sep 2025 (First Stage), 17 Mar 2026 (Second Stage)				
Destination Innovative Research on European Cultural Heritage and Cultural and Creative Industries				
HORIZON-CL2-2025-02-HERITAGE-02-two-stage: Innovative approaches to intangible cultural heritage for societal resilience	RIA	12.00	3.00 to 4.00	3
Destination Innovative Research on Social and Economic Transformations				
HORIZON-CL2-2025-02-TRANSFO-04-two-stage: Gender differences in career trajectories of parents and their implications for gender equality and family well-being	RIA	10.20	Around 3.40	3
Overall indicative budget		22.20		

General conditions relating to this call

<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and</i>	The criteria are described in General Annex

⁵ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.
The Director-General responsible may delay the deadline(s) by up to two months.
All deadlines are at 17.00.00 Brussels local time.
The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

⁶ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

<i>exclusion</i>	C.
<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

Call - Cluster 2 Partnerships

HORIZON-CL2-2025-03

Overview of this call⁷

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ⁸	Indicative number of projects expected to be funded
		2025		
Opening: 15 May 2025 Deadline(s): 16 Sep 2025				
Destination Innovative Research on European Cultural Heritage and Cultural and Creative Industries				
HORIZON-CL2-2025-03-HERITAGE-01: Co-funded European partnership for Resilient Cultural Heritage	COFUND	60.00	Around 60.00	1

⁷ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.
The Director-General responsible may delay the deadline(s) by up to two months.
All deadlines are at 17.00.00 Brussels local time.
The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

⁸ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

Overall indicative budget		60.00

General conditions relating to this call	
<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and exclusion</i>	The criteria are described in General Annex C.
<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

DESTINATIONS

Destination Innovative Research on Democracy and Governance

Resilient and strengthened democratic systems, anchored in robust and inclusive political decision-making, will be fundamental in the context of complex and interconnected challenges and threats our citizens and societies are confronted with. As stated in the Political Guidelines for the European Commission 2024-2029, “Europe’s future in a fractured world will depend on having a strong democracy and on defending the values that give us the freedoms and rights that we cherish.”⁹

The Strategic Foresight Report 2023¹⁰ already recalled how “disenfranchisement, growing discontent, and the lack of a positive agenda combine into an erosion of trust in public institutions, polarisation, and an enhanced appeal of extremist, autocratic, or populist movements” and how “democracy is increasingly challenged as the governance model best suited to deal with growing socio-economic issues.” The report acknowledged that even “in the EU, some of the core requirements for a functioning democracy are impaired.” A democratic impairment manifested in several phenomena like “challenges to the rule of law, and an increasing silent citizenship, e.g. a consistent decrease of electoral turnout in many Member States in both national and European elections, or the growing lack of interest in general democratic life [...] the personalisation of politics, with political leaders considered more important than political parties, [...] polarisation of the political debate and the sense of isolation [...] amplified by mis- and disinformation, group dynamics in social media, or algorithmic bias.”

Social sciences and humanities research is critical for effectively addressing those challenges. While science will provide knowledge, insights and theoretical frameworks, the involvement of stakeholders on the ground (community organisations, policymakers, civil society representatives, among others) is determinant for facilitating the uptake and impact of research results and therefore encouraged in this destination. This collaborative approach ensures that research is based on real-world experiences and needs, leading to more effective and relevant outcomes.

By addressing key societal challenges through this inclusive methodology, the impact of research on citizens’ lives will be enhanced. For instance, promoting gender equality and protecting minority rights are not only academic endeavours but necessities that reinforce social cohesion and justice. Research findings can shape legislation, drive social innovations, and support the development of initiatives that directly benefit communities. Research contributes to the development of democratic systems that are more inclusive, flexible and adaptable to change. By considering a wide range of views and experiences, policies and institutions are better able to address the needs of all citizens, increasing social fairness.

⁹ Political Guidelines for the next European Commission 2024-2029, <https://europa.eu/wywg4P>, p. 23

¹⁰ https://commission.europa.eu/system/files/2023-07/SFR-23_en.pdf

Expected impact:

Proposals for topics under this destination should set out a credible pathway to contributing to the following expected impact of the Horizon Europe Strategic Plan:

- Reinvigorating democratic governance by improving the accountability, transparency, effectiveness and trustworthiness of institutions and policies based on rule of law, and through the expansion of active and inclusive citizens' participation and engagement empowered by the safeguarding of fundamental rights.

The aim of the research investment supporting this impact is to develop a robust evidence base on which to build effective, relevant and sensitive policies that bolster the resilience of democratic systems and protect them from threats.

The expected impact will be achieved by generating new knowledge and understanding, and developing strategies, methods and innovative solutions, as well as policy recommendations, under the following three areas:

1. **GLOBAL CHALLENGES - Fostering democracy and promoting EU values in times of geopolitical shifts and global poly-crisis**, including: effectiveness of science diplomacy as a way to strengthen multilateral cooperation; balancing ethical foreign policy with economic and security interests in foreign countries; disinformation and Foreign Information Manipulation and Interference (FIMI), as a tool of warfare; EU enlargement and neighbourhood policies to better understand the mechanisms to promote democratisation and the attainment of the EU *acquis*, fundamental values and the rule of law.
2. **RESILIENT DEMOCRACIES – Increasing the resilience of democracy in the face of external and internal threats**, including: nature of extremism and drivers of radicalisation, polarisation and hate speech, (such as xenophobia, racism or misogyny); autocratic and anti-democratic tendencies in the EU; violence and conflict in society with a focus on politically motivated violence (incl. antisemitism); balance between protecting free speech and implementing necessary regulation of it; public misconceptions towards EU enlargement.
3. **AGILE INSTITUTIONS & INCLUSIVE SOCIETIES – Modernise democratic institutions and public sector processes for the 21st century**, including: innovative public administration and new ways to guarantee quality and incisiveness of public administration (through an indirectly managed action); trust in governance and the Rule of Law, including independence and efficiency of the judiciary; ecosystem-based approach to public decision- and policymaking, combined with foresight and anticipatory governance.

The destination will seek synergies with other relevant EU programmes, in particular for the uptake of research results and innovative solutions developed under Horizon Europe. Interaction – among others – with the following programmes is encouraged: Digital Europe (DIGITAL), Technical Support Instrument, CERV (Citizens, Equality, Rights and Values),

Erasmus+, ESF+ and Global Europe: Neighbourhood, Development and International Cooperation Instrument.

Applicants are encouraged to consider, where relevant, the services offered by the current and future EU-funded European Research Infrastructures, particularly those in the social sciences and humanities domain¹¹. Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this destination is FAIR (Findable, Accessible, Interoperable and Re-usable).

To maximise the impacts of R&I under this Destination in line with EU priorities, international cooperation will be encouraged whenever relevant in the proposed topics.

Proposals are invited against the following topic(s):

HORIZON-CL2-2025-01-DEMOCRACY-01: Advisory support and network to counter disinformation and foreign information manipulation and interference (FIMI)

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p> <p>If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.</p>
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply:

¹¹ For a full list see <https://ri-portfolio.esfri.eu/ri-portfolio/table>. In the social sciences domain, see for example: CESSDA - Consortium of European Social Science Data Archives (<https://www.cessda.eu/>), ESS – European Social Survey (<https://www.europeansocialsurvey.org/>), SHARE - Survey of Health, Ageing and Retirement in Europe (<https://www.share-eric.eu/>) or the European Holocaust Research Infrastructure (<https://ehri-project.eu/>)

	The granting authority can fund a maximum of one project.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹².</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- EU institutions and national decision-makers, practitioners in relevant sectors, civil society organisations and other societal actors have an increased understanding of the validity of theoretical models, the possibilities to implement recommendations, toolkits, methodologies and other solutions to prevent and counter FIMI and related disinformation actions.
- Practitioners in relevant sectors, civil society organisations and other societal actors involved in the design and implementation of measures to prevent and counter FIMI, including disinformation in different sectors have access to a network and tailor-made advisory support.
- EU institutions and national decision-makers are equipped with science-based tools and evidence-based policy recommendations to proactively conceive, implement, and innovate measures to prevent and counter FIMI and related disinformation actions, and other actions instigated by third countries.

In addition, projects should contribute to at least one of the following expected outcomes:

- Frameworks and approaches that advance common understanding and facilitate collaboration to address and counter disinformation and FIMI, such as D-RAIL¹³ or the DISARM framework¹⁴, are enhanced, improved or complemented, to foster their adoption by a wider audience of professionals.
- Practitioners in relevant sectors (such as education, security, defence, transport, foreign relations, ICT, media, etc.), civil society organisations and other societal actors have better knowledge and increased awareness of the challenges posed by disinformation and FIMI and of their pervasiveness in their respective sectors.

¹² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹³ <https://www.disinfo.eu/publications/directing-responses-against-illicit-influence-operations-d-rail>

¹⁴ <https://www.disarm.foundation/framework>

- EU institutions and national decision-makers, practitioners in relevant sectors, civil society organisations and other societal actors have evidence of the ways of working and impact of new technologies (AI, Big Data, etc.) in the creation and dissemination of disinformation content and FIMI activities and have new tools and methods to design and implement appropriate initiatives to address these phenomena.

Citizens, civil society organisations and other societal actors have increased capacities to identify and counter disinformation content and FIMI and related disinformation actions.

Scope: Hybrid threats, and more specifically the phenomena of disinformation and FIMI¹⁵ are a growing danger for democracy, human rights, social cohesion, and European security. In recent years, the EU has developed and started to implement several strategies and numerous projects to counter disinformation and FIMI.

The aim of this action is to bring to society the benefits from previously EU-funded research (including SSH research) dealing with disinformation and FIMI in the field of democracy and governance be it in Horizon 2020 and Horizon Europe or other relevant programmes (such as Citizens, Equality, Rights and Values, Digital Europe, and Global Europe). For this, proposals should build on the rich stock of actionable recommendations, knowledge, toolkits, educational material, and scientific methods etc. developed in particular by the several Horizon 2020 and Horizon Europe projects on disinformation and FIMI and make them accessible to a wider audience (i.e., professionals in various sectors, including media, education, security, defence, transport, foreign relations, ICT, etc.).

Several projects¹⁶ funded under Horizon 2020 have aimed to conceive and implement solutions that help professionals spot and debunk mis- and disinformation and information manipulation or address hybrid threats. Proposals should indicate which Horizon 2020 projects are considered sources of research results relevant to the activities to be carried out and are encouraged to seek collaboration with these research teams. Recent projects funded under Horizon Europe investigate specifically the FIMI phenomenon. Proposals should build on, and seek cooperation with, past and on-going EU-funded projects,¹⁷ as well as EU-led initiatives, such as the One-Stop-Shop for Tackling R&I Foreign Interference. Proposals should indicate which additional Horizon Europe projects they would build on, should there be more than those funded under the mentioned topics.

Proposals should further develop frameworks already in use by FIMI and disinformation practitioners (such as the DISARM Framework). Proposals should also consider the work

¹⁵ See: https://www.eeas.europa.eu/eeas/tackling-disinformation-foreign-information-manipulation-interference_en

¹⁶ Such as EU-HYBNET (<https://cordis.europa.eu/project/id/883054>).

¹⁷ In particular, projects funded under HORIZON-CL2-2023-DEMOCRACY-01-01: Detecting, analysing and countering foreign information manipulation and interference; HORIZON-CL2-2023-DEMOCRACY-01-02: Developing a better understanding of information suppression by state authorities as an example of foreign information manipulation and interference; HORIZON-CL3-2021-FCT-01-03: Disinformation and fake news are combated and trust in the digital world is raised.

done by the EDMO Hubs¹⁸ and find ways to integrate these results into the advisory support and design actions to disseminate Hubs.

The capacity-building activities and advisory support should be addressed to a wide range of stakeholders and potential end-users, including non-scientific and non-academic actors, such as public bodies, NGOs, fact-checkers, civil society organisations, policymakers, educational bodies, law practitioners, or other potential end-users of the research results. The involvement of one or more of these categories of stakeholders is required to test and take up the research results and to explore their readiness to be implemented and replicated. Those activities and support could also involve signatories of the Code of Conduct on Disinformation, media companies, public and private broadcasters, online news platforms, and digital services object of the European Media Freedom Act (EMFA), and other private entities, such as providers of intermediaries' services under the Digital Services Act (DSA). The involvement of these categories of stakeholders is required to provide researchers with access to data necessary to undertake research and access to platform data on the spread and behaviour of disinformation online.

With the emergence of new technologies (especially those based on [generative] Artificial Intelligence and the use of Big Data), the actors promoting disinformation and FIMI activities have significantly increased their capacity to act, they are able to develop more targeted content across a broader spectrum of sectors, and they are more effective than disinformation approaches based for instance on bot farms¹⁹. AI could also be used to develop new disinformation detection technologies, while addressing the ethical and legal challenges implied.

Proposals should identify gaps in research, in particular with regards to access to data, as well as other obstacles to large-scale scientific inquiry of disinformation and FIMI threats. They should identify challenges and opportunities based on an analysis of ongoing and past research and innovation projects, particularly those offered by generative Artificial Intelligence in the context of generation, dissemination, detection and debunking of disinformation and FIMI activities more broadly. The proposals should make concrete recommendations on how the gaps in research could be filled.

Proposals are encouraged to also address the issue of identity-based disinformation and FIMI targeting LGBTIQ people.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-DEMOCRACY-02: Fostering the consolidation of European science diplomacy

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.50 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²⁰</p>

Expected Outcome: Building on the recommendations of the EU Science Diplomacy Working Groups²¹, the project should contribute to all of the following expected outcomes:

- EU and national policymakers as well as researchers obtain a taxonomy of European science diplomacy which maps the relevant players, including from academia, policymaking, diplomacy, civil society, and business, and have an overview of the science diplomacy ecosystems in the EU and the existing capacities, infrastructures,

²⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

²¹ <https://op.europa.eu/en/publication-detail/-/publication/4b319f3d-e9ff-11ef-b5e9-01aa75ed71a1>

networks (including diaspora and alumni networks), training activities, strategies, and publications at EU and national level. This should also include a mapping of science diplomacy strategies of third countries to inform EU responses.

- Design and launch a European Science Diplomacy Platform as a community of research and practice providing an impartial space for interaction and resources for institutional capacity building, knowledge sharing and scaling up of best practices, involving the key players in European science diplomacy, from both the EU and national levels, liaising also with European scientists in the diaspora and alumni of European mobility schemes, and creating links with existing platforms.
- Building on the activities of existing mechanisms such as the Marie Skłodowska-Curie Actions (MSCA), ERC, COST, EURAXESS, the European Universities initiative, the European Diplomatic Academy, and relevant programmes at national level, schemes, competence frameworks and curricula for training, capacity-building, and mutual learning in European science diplomacy, are developed, paying particular attention to the needs of science counsellors and other diplomats dealing with matters that rely heavily on scientific expertise.

Scope: Not least thanks to the Horizon 2020 cluster on science diplomacy, which funded three projects in 2016-2022²², a vibrant community of European science diplomacy scholars and practitioners has emerged, leading to the development of the EU Science Diplomacy Alliance²³. Further input was delivered by the former Strategic Forum for International S&T Cooperation (SFIC)²⁴, which suggested the development of an EU Science Diplomacy Platform and Roadmap. In addition, a growing number of Member States have adopted national science diplomacy strategies or agendas, or are currently exploring their development, and have strengthened scientific-technological capacities in their Ministries of Foreign Affairs (e.g., establishment of an informal Network of Science Advisors and Science Diplomacy Coordinators in EU Ministries of Foreign Affairs). An increasing number of recent EU policy documents have made explicit or implicit reference to science diplomacy and the need for foreign policy to be based on the best possible evidence. Against the background of a rapidly changing geopolitical and scientific-technological environment, with global competitors using science diplomacy in a much more strategic manner, there is a need to consolidate European science diplomacy efforts and explore synergies to tackle existing vulnerabilities.

Science diplomacy forms an integral part of the Global Approach to Research and Innovation²⁵, the EU's strategy for international cooperation in research and innovation, which prominently advocates that a stronger focus on science and technology in the EU's

²² [Using Science for/in Diplomacy for Addressing Global Challenges \(S4D4C\)](#), [Inventing a Shared Science Diplomacy for Europe \(InsSciDE\)](#), [European Leadership in Cultural, Science and Innovation Diplomacy \(EL-CSID\)](#)

²³ <https://www.science-diplomacy.eu>

²⁴ https://research-and-innovation.ec.europa.eu/strategy/strategy-2020-2024/europe-world/international-cooperation/science-diplomacy/sfic_en

²⁵ https://research-and-innovation.ec.europa.eu/system/files/2021-05/ec_rtd_com2021-252.pdf

foreign and security policies in terms of science diplomacy would help the EU to project soft power and pursue our economic interests and fundamental values more effectively. In its Conclusions on the Global Approach²⁶, the Council called on the Commission and the European External Action Service to develop a European Science Diplomacy Agenda. At the informal Competitiveness Council meeting in July 2023, EU Research Ministers underlined the importance of European science diplomacy action. Consequently, the European Commission organised together with the Spanish Presidency of the Council of the EU the first European Science Diplomacy Conference in Madrid in December 2023 and the launch of EU Science Diplomacy Working Groups to develop recommendations for a potential future European framework for science diplomacy.

Against this background, the Coordination and Support Action will contribute to consolidating the European science diplomacy landscape both in research and in practice. In particular, it should provide, once operational, a mapping of all relevant players, which is still lacking at this point, and establish a European Science Diplomacy Platform²⁷. The added value of such a platform is that it can serve as a “do tank”, bringing together scientists (including from SSH disciplines) and diplomats alike and delivering concrete support for policy needs, such as:

- advising on the use of science diplomacy to help achieving the EU’s foreign and security policy goals (e.g., in the context of Global Gateway²⁸),
- identifying research needs and providing expert knowledge to policymakers and diplomatic services through science advice and science communication, thereby strengthening multilateralism and democratic governance,
- designing methods for assessing the impact of relevant actions,
- exploring synergies with other fields of diplomacy, most notably tech / innovation / digital diplomacy, as well as public diplomacy and culture diplomacy, including the use of arts to communicate science related to global challenges,
- assisting policy dialogues with audiences and stakeholders in third countries as well as international organizations and other multilateral settings, and
- supporting the EU’s science diplomacy outreach to partners world-wide, including to relevant international organizations, such as UNESCO.

In addition, this Coordination and Support Action should explore and develop mechanisms for training, capacity-building, and mutual learning in science diplomacy in a consistent manner, including by exploring the feasibility of science diplomacy fellowship schemes in European and Member State/Associated Countries’ institutions at home and in diplomatic representations abroad.

²⁶ <https://data.consilium.europa.eu/doc/document/ST-12301-2021-INIT/en/pdf>

²⁷ Creating links with existing platforms such as the EU’s [Cultural Relations Platform](#) and the EU [Alumni Platform](#).

²⁸ [Global Gateway - European Commission \(europa.eu\)](#)

Engagement with partners outside the EU is particularly encouraged for this project.

Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-DEMOCRACY-03: Preparing the EU for future enlargement: challenges and opportunities

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The consortium must include at least one entity, as a beneficiary, established in one of the following countries: Albania, Bosnia Herzegovina, Georgia, Kosovo²⁹, Montenegro, North Macedonia, Republic of Moldova, Serbia, Ukraine, or Türkiye.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).³⁰.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Policymakers and public administrations in each Member State, candidate country, potential candidate country, and at EU institutional level, are provided with thematic

²⁹ This designation is without prejudice to positions on status and is in line with UNSCR 1244/1999 and the ICJ Opinion on the Kosovo declaration of independence.

³⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

insights on lessons learned from previous enlargement processes for the development of future policies with particular attention to democracy, rule of law and governance related topics.

- Societal awareness of the enlargement process is increased both within the Union and in the candidate country(ies), or potential candidate country(ies), through a deeper understanding of the political, social and economic consequences of enlargement versus non-enlargement of the EU.
- EU authorities and public authorities in Member States benefit from better use of existing interactive tools to better inform and promote educational opportunities on enlargement process for citizens in the Union and in the enlargement countries.
- Public's at large involvement in enlargement is enhanced through transparent and participatory processes, leveraging digital tools for broader engagement.

Scope: As stressed in several Commission's communications³¹ and following the granting of the candidate country status to Georgia, Moldova and Ukraine, there is a need to invest more in understanding enlargement priorities, opportunities, and challenges based on the perspective of a EU counting more than 30 Member States. This also means that EU Member States need to be better prepared, while citizens and civil society must gain a better understanding of what enlargement entails.

The proposed research should improve on the one hand, the EU Member States' understanding of the history, political and economic situation of the candidate countries and potential candidates, through socio-historical research, combined with a legal and economic approach (including expertise from relevant SSH disciplines). And, on the other hand, it should support EU citizens and civil society to gain a better understanding on challenges and opportunities related to potential future enlargements of the EU.

Reflecting on previous enlargements, the proposals should provide thematic insights on lessons learned and identify potential similarities with the candidate countries, focusing particularly on democracy, rule of law and governance-related topics.

Adopting a flexible and adaptive approach to enlargement, responsive to geopolitical dynamics and regional challenges, might be necessary. Utilizing foresight and scenario planning can help the EU and the Member States to anticipate future changes and strategically manage the enlargement process. This approach can also consider differentiation within EU governance to build resilient, inclusive, and participatory societies.

A comparative analysis of the detailed terms and conditions of membership in the accession treaties, both regarding terms and conditions issued by Member States and acceding countries

³¹ COM(2024) 146 final <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=COM:2024:146:FIN> on "pre-enlargement reforms and policy reviews"; COM(2020) 57 final <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:52020DC0057> on "Enhancing the accession process - A credible EU perspective for the Western Balkans"; COM(2023) 691 final <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=COM:2023:691:FIN> on "New growth plan for the Western Balkans".

upon joining the Union, such as transition periods for the freedom of movement of workers and persons, or the acquisition of real estate, could serve as an interesting case study for candidate countries and other stakeholders involved in this process. Public support and engagement for EU enlargement are crucial but fluctuate largely between Member States and candidate countries. To foster a more inclusive process, it is essential for the proposals to involve citizens early in the enlargement discussions, ensuring transparency and addressing political, economic and social concerns aiming at improving the credibility and acceptance of the enlargement process. The proposals should also address the EU's readiness to enlarge, considering the "enlargement fatigue" and the rise of euroscepticism within the Union and in the candidate countries.

Building concrete knowledge through comparative analysis of the motives of candidate countries to join the EU would be beneficial to observe any similarities and whether these motivations are still present, strengthened or declining in the Member States. Efforts should also be directed towards effective and inclusive communication on the EU integration process and the benefits of enlargement.

Additionally, the proposals should collect evidence on the role of societal dialogues and education in proposing learning approaches to EU integration and enlargement prospect within the Union. This research could combine mutual, social and intercultural learning to support the development of local or regional initiatives by the civil society. These learning approaches could also be based on evidence from formal learning in education institutions or informal learning through civil society initiatives. Proposals should consider citizens' engagement and dialogue, for seeking wider input and encourage youth participation.

To support this goal, the proposals should identify the most effective tools for public administration and policymakers to improve citizens' understanding of the enlargement process, seizing educational opportunities and societal awareness. Utilising emerging digital technologies such as artificial intelligence and social media could be beneficial in meeting the crucial needs to use digital communication.

Pilots should be carried out in at least four EU Member States to assess the effectiveness of these tools, which may also have synergies with people-to-people programmes such as Erasmus+, the European Solidarity Corps, Interreg, or the Civil Society Facility, fostering a common European spirit between EU Member States and candidate countries.

Based on the research, policy recommendations should be developed to promote inclusive strategic communication and citizen engagement on EU integration and values within the Union and in the Member States. These policy recommendations should also explore how to support the reform process of candidate countries and/or learn from their existing reforms regarding Chapters of the Acquis, such as of Chapter 10 (Information Society and Media), Chapter 23 (Judiciary and Fundamental Rights), Chapter 24 (Justice Freedom and Security), and Chapter 34 (Institutions).

Proposals are encouraged to network with and build on previously funded projects under Horizon Europe calls³², Horizon 2020 or other EU programmes, e.g. Global Europe³³ or the Instrument for Pre-accession³⁴. Clustering and cooperation with other selected projects under this topic and other relevant projects are strongly encouraged.

Applicants to this topic are also encouraged to consider the data offered by European Research Infrastructures in the social sciences and humanities domain³⁵.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-DEMOCRACY-04: Open strategic autonomy, economic and research security in EU foreign policy

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 7.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ³⁶.</p>

³² In particular HORIZON-CL2-2023-DEMOCRACY-01-08: Political perspectives for the Eastern Neighbourhood and the Western Balkans, HORIZON-CL2-2021-DEMOCRACY-01-04: Democratic politics in the EU's neighbourhood, as well as other relevant projects funded under other clusters and pillars of Horizon Europe.

³⁵ For example, CESSDA, the European Social Survey or SHARE.

³⁶ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link:

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- EU institutions, national decision-makers, and practitioners in various relevant fields dispose of consolidated concepts, workable definitions and a robust evidence base for policymaking, regarding open strategic autonomy and economic security - including research security.
- EU institutions and national decision-makers gain a better understanding of how the open strategic autonomy and economic security – including research security – can benefit the EU and its Member States, associated countries, Neighbourhood, and developing countries, and of the impacts of potentially divergent EU and Member States' related policies.
- EU institutions and national decision-makers are provided with policy recommendations on how to enhance open strategic autonomy and economic security – including research security – without harming economic and societal actors in the EU, associated countries, Neighbourhood and developing countries or the geopolitical influence of the EU.
- EU institutions, national decision-makers and researchers (including from SSH disciplines) have a deeper understanding of the drivers of open strategic autonomy and economic security – including research security – in key policy fields and what its historical evolution has been.

Scope: The EU's open strategic autonomy refers to the EU's ability to act autonomously (i.e., without depending on other countries) in strategically important policy areas, linked to both the economic and non-economic spheres. These areas may include energy, research, health, media, technology, defence, food, industry, as well as development cooperation, promotion of democracy and defence and promotion of human rights.

The concept of open strategic autonomy is not new, and its interpretation has changed, producing various legislative and non-legislative initiatives in several areas of key importance for the EU and its Member States. Since 2021, the scope of the EU's open strategic autonomy has been expanded to practically all EU policy areas, including that of democracy and governance, but other similar concepts also emerged. In recent years and since Russia's invasion of Ukraine in February 2022 in particular, progress has been made towards achieving (open) strategic autonomy, although the concept remains clouded by changing terminology.

The European Economic Security Strategy was launched in June 2023³⁷, setting out a framework for robust assessment and management of economic security risks at EU, national and corporate levels. In December 2023, the European Commission's Joint Research Centre (JRC) published a report assessing open strategic autonomy in the innovation and production domains³⁸. It observes that, in addition to pure economic dependencies, the changing

https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

³⁷ See: https://ec.europa.eu/commission/presscorner/detail/en/IP_23_3358

³⁸ See: <https://publications.jrc.ec.europa.eu/repository/handle/JRC136359>

geopolitical landscape has increased potential vulnerabilities stemming from international collaboration in research and innovation. In May 2024, the Council adopted a Recommendation on Enhancing Research Security, which aims to keep international cooperation in research and innovation both open and safe by managing risks and building resilience in the R&I sector across Europe.

Against this background, proposals should contribute to conceptual clarity, definition of key concepts and the theoretical framework underpinning these concepts as well as gather evidence for policymaking, including through analysis of the threat landscape. Proposals should analyse the drivers for open strategic autonomy and economic security in various sectors of the European economy, notably the research, innovation and production domains, and map the relevant actors, trends, and risks.

Proposals are encouraged to analyse the correlation between the concepts of open strategic autonomy and economic security, including research security, considering the three pillars of the European Economic Security Strategy: promoting the EU's competitiveness, protecting it from risks to economic security and collaborating with the widest range of countries that share the EU's concerns or interests. Hence, proposals should develop recommendations on how to strike the right balance between being "as open as possible" and "as closed as necessary", taking into consideration also what the implications of greater autonomy / technological sovereignty of the EU and its Member States would mean for economies and populations outside the EU, especially in developing countries.

Proposals are encouraged to assess the proportionality and effectiveness as well as the costs and benefits of policies and measures aiming at open strategic autonomy/technological sovereignty and economic security, including research security, and their implications for the research and innovation sector. This includes analysing interlinkages and tensions with concepts such as open science, academic freedom, research integrity and science diplomacy. Proposals should also analyse the risks and implications of individual Member States not adhering to EU strategic autonomy policies and explore the legal tools available to prevent and address such divergences.

There is a risk that open strategic autonomy ambitions do not consider negative impacts on developing countries, and might weaken multilateralism, cross-border trade, and foreign investment. Moreover, the open strategic autonomy policies could encourage the spread of protectionist policies globally, impacting particularly on developing countries. They could also unintentionally undermine Europe's position as a trade and development partner in developing countries. The latter could build ties with other global players, potentially increasing their dependence on them for resource extraction, trade, infrastructure development, and other key areas. Therefore, proposals should also consider what the implications of greater autonomy or sovereignty of the EU and its Member States would be for populations outside the EU, and how this could influence the engagement of professionals and organizations active in areas such as development cooperation, promotion of democracy and defence and promotion of human rights.

Proposals are encouraged also to investigate and gather evidence on what policies other international key partners develop in the areas of open strategic autonomy and economic security, including research security, and how these may impact the EU and its Member States. Ideas should be developed indicating how a level playing field in the cooperation with these key partners/geopolitical players could be guaranteed, ensuring that safeguarding measures do not hinder cooperation between partners.

In recent years, many Member States have developed foreign policy guidelines and strategies that incorporate feminist principles and the promotion of respect for minorities. These political developments, alongside academic debates, indicate a growing trend of integrating ethical and feminist principles into diplomatic strategies. Proposals are encouraged to consider such ethical and gender-responsive approaches to foreign policy and the design of open strategic autonomy. Research activities should involve a wide range of stakeholders and societal actors, including non-scientific and non-academic actors, such as public bodies, policymakers, private corporates, industry federations, media organisations, non-governmental organisations, civil society organisations, educational research bodies. Proposals under this call are encouraged to make use of participative methodologies and experimental methods.

Proposals should build on past EU-funded projects, and seek cooperation with on-going ones, addressing issues relating to strategic autonomy. Proposals should indicate which Horizon 2020 projects are considered sources of research results relevant to the activities to be carried out. Research activities could involve the analysis of Important Projects of Common European Interest (IPCEI). Clustering and cooperation with other selected projects under this topic and other relevant projects are strongly encouraged.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-DEMOCRACY-05: Countering and preventing radicalisation, extremism, hate speech and polarisation

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions

<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ³⁹.</p>
---	---

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- EU and national decision makers, researchers (including from SSH disciplines), practitioners, educators, and media organisations are equipped to deliver effective prevention and counter measures on radicalisation, extremism, hate speech, and polarisation, by gaining a comprehensive understanding of the linkages between social and economic inequality, polarisation, radicalisation, and hatred, and by implementing effective recommendations, tools, narratives, methodologies, and other innovative solutions.
- EU institutions and national policymakers gain insights into radicalisation, extremism, and hate speech, including their impact on young people and how youth perceive and engage with information on these phenomena, whether online or offline.
- EU institutions, national decision-makers, and civil society organisations acquire a thorough understanding of the mechanisms driving successful extremist, radical, and hate campaigns, as well as the diverse political environments and their modes of interaction and communication, extending beyond social media and online platforms.

In addition, projects should contribute to at least one of the following expected outcomes:

- Improved understanding of methodologies to effectively map hate ecosystems online through qualitative and quantitative tools, also with a view to supporting the enforcement of existing laws prohibiting racist, xenophobic and misogynistic hate speech, and to protect potential victims.
- Increased understanding of the link between disinformation (including foreign information manipulation and interference FIMI) and hate speech, and radicalisation and extremism, in particular how disinformation and hate campaigns deepen social divisions and create the conditions for radicalisation and extremism.
- Increased understanding of patterns of media consumption by individuals and their use of traditional media vs social media to form their own opinion, the effects of a polarised

³⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

public sphere on the media landscape, including the role of journalists; and the possible developments in the area of citizens'-led media content.

- Increased understanding of the role of traditional media, online media, social media, and artificial intelligence in countering mis- and disinformation and information manipulation, hatred, and the spread of narratives that drive radicalisation, polarisation, and extremism in societies.
- Improved tools and methods to assess the reliability of sources and related meta-tagging systems to map different points of view, as well as other actionable journalistic practices (e.g. forums, citizens' engagement and outreach, communication channels with editorial teams) which have proven effective in improving the quality of debate in the media.
- Increased availability of training tools, materials, and methods for educators and educational organisations to engage with students, enhancing their capacity to provide opportunities to raise awareness and counter hate, extremism and polarisation.

Scope: The phenomena of radicalisation, extremism, incitement to hatred and polarisation are a growing threat to democracy and social cohesion. In recent years, the EU has adopted several strategies to combat racism, antisemitism and xenophobia, as well as to counter hate speech and hate crimes. The EU also has policy tools to respond to all forms of extremism and radicalisation. As recalled by the Joint Communication "No Place for Hate"⁴⁰ of 6 December 2023, these initiatives are even more urgent considering the growth in hate speech and crimes against women and people belonging to vulnerable groups in recent years.

Social media amplifies radicalisation, extremism, hate speech, information manipulation and polarisation. Algorithm-driven personalisation restricts the public sphere and creates "echo chambers" where users primarily engage with like-minded views. This confirmation bias intensifies polarisation, fuels radicalisation, aids in recruiting extremists, and promotes hate speech and crime. Confirmation bias influences both social and traditional media users, as individuals seek information aligning with their beliefs. This trend impacts public discourse, fostering mis- and disinformation and information manipulation including conspiracy theories by limiting exposure to diverse perspectives and distorting perception of reality.

These phenomena arise from distortions in online interactions and media outlet characteristics, especially those that are mostly if not solely disseminated online. In certain member states, online media have become a primary information source alongside, or in the place of, traditional media channels (TV, radio, press), while lacking transparency regarding affiliations with interest groups or foreign influences. Moreover, radicalization and polarisation spread through social networks beyond social media. Therefore, proposals should also consider offline social networks, which include relationships like friendships, kinships, and shared interests, not solely reliant on online platforms.

Research activities should involve a wide range of stakeholders and potential end-users, including non-scientific and non-academic actors, such as, but not limited to, public bodies,

⁴⁰ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A52023JC0051>

media organisations and outlets, journalists, social media platforms, and representatives from other social networks, non-governmental organisations, civil society organisations, policymakers, educational bodies, other potential end-users of the research results. The involvement of one or more of these categories of stakeholders is required to test and uptake the research results and to explore their readiness to be implemented and replicated. More specifically, research activities are encouraged to involve private entities, such as providers of intermediaries' services under the Digital Services Act (DSA), as their involvement is required to provide researchers with access to data necessary to undertake research and access to platform data on the spread and behaviour of disinformation online.

Proposals are encouraged to explore the following themes (among others): radicalisation and polarisation driven by stereotypes related to gender, religion, or ethnic minorities; the impact of new technologies on the production and dissemination of radicalisation and extremist content; the role of social cohesion, as both radicalisation and democratic participation are significantly influenced by the level of social cohesion within society; linkages between social and economic inequality and radicalisation, extremism, hatred and polarisation⁴¹.

Proposals are encouraged to include historical and comparative analysis, which is crucial for understanding the past uses of hate speech as well as contemporary efforts by radical and extremist organisations to shape narratives. By contextualising these dynamics, proposals can explore the evolution and impacts of these phenomena over time, providing insights into effective strategies for combating them.

Proposals should collaborate with the EU Knowledge Hub on radicalisation prevention (RAN – Radicalisation Awareness Network) to align priorities and share outcomes and should develop advisory services to its members.

Proposals are encouraged to seek collaboration whenever possible with relevant projects selected under previous EU-funded calls, such as HORIZON-CL3-2022-FCT-01-03 - Enhanced fight against the abuse of online gaming culture by extremists. Clustering and cooperation with other selected projects under this topic and other relevant projects are strongly encouraged.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-DEMOCRACY-06: Towards a European research hub on contemporary antisemitism and Jewish life and culture

Call: Culture, Creativity and Inclusive Society - 2025

⁴¹ Research in this field was recommended also by EU citizens in the context of the European Citizens Panel on tackling hatred in society, held in April and May 2024.

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁴².</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- A network of practitioners, including researchers in the field of contemporary antisemitism and research on Jewish life, is established and developed, providing a dynamic space for academic conversations, as well as training and career opportunities.
- Research gaps and relevant research centres to further develop research on contemporary antisemitism and Jewish life in Europe are identified, with a particular focus on regions previously underrepresented in the study of contemporary antisemitism and Jewish life
- Discussion and formulation of methodological standards in the field are facilitated, fostering high quality empirical work.

⁴² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Strategic planning for the field on a Europe-wide level, including a concrete and credible action plan to grow this network into a sustainable research institution, is provided.
- Links between research and policymaking within and for Jewish communities as part of the wider process of nurturing Jewish life in Europe are deepened.

Scope: The first-ever EU strategy on combating antisemitism and fostering Jewish life (2021-2030)⁴³ is an ambitious and comprehensive strategy adopted by the European Commission on 5 October 2021. Generations after the end of the Shoah, antisemitism is worryingly on the rise, in Europe and beyond, especially since the turn of the 21st century⁴⁴.⁴⁵ the Commission calls "for action, for all Europeans, to ensure that Europe is a place where our founding values are enjoyed by everyone, on an equal basis." Antisemitism is incompatible with Europe's core values. It represents a threat not only to Jewish communities and to Jewish life, but to an open and diverse society, to democracy and the European way of life. The European Union is determined to put an end to it.

The third pillar of the Strategy covers "Education, research and Holocaust remembrance" for a Europe that remembers its past and looks into the future through research and education. In this context, an independent expert report was commissioned in 2022 to assess the need to create a research hub on contemporary antisemitism and Jewish life and deliver recommendations⁴⁶.

The goal of this action is to establish a research hub in the shape of a network of researchers on contemporary antisemitism and Jewish life in Europe, bringing together a critical mass of such actors in Europe, from Member States and Associated Countries representing the different parts of Europe. Such a hub should foster the research field's identity and support training and career opportunities for researchers in the field, with a focus on early career researchers. Indeed, the hub's primary objectives should be to help recruit, train and retain expert capacity in research on contemporary antisemitism and Jewish life, and to help ensure that research generated by the field can be used to help formulate policy, at national and European levels.

One of the key expected outcomes is to prepare the sustainability of the hub. That includes exploring and eventually securing further regional, national and European funding, including (but not restricted to) a possible development into a permanent research infrastructure or European partnership. Proposals should demonstrate the capacity of the consortium to secure funding beyond the project's lifetime.

⁴³ Text of the strategy available here: <https://op.europa.eu/s/zXwi>. The first progress report on its implementation can be retrieved here: <https://op.europa.eu/s/zXwh>

⁴⁴ See, for instance, the third survey of the European Union Agency for Fundamental Rights on discrimination and hate crime against Jews, available at: <https://fra.europa.eu/en/project/2023/third-fra-survey-discrimination-and-hate-crime-against-jews>

⁴⁵ https://commission.europa.eu/document/c60c451c-ccd2-406a-be3a-ef65123f2bb6_en

⁴⁶ [Independent Expert Report "The field of research on contemporary antisemitism and Jewish life - Working towards a European research hub" \(2023\)](#)

In practical terms, the hub should be embedded within an appropriate existing research community– to help manage the practicalities of the work and to ensure optimal synergy with the field as it is currently constructed. It should provide opportunities for members to meet in person (in the shape of conferences, seminars, events etc) across geographical Europe. It should have a governance structure that includes an executive board comprised of leading research and policy specialists in the field, a permanent professional secretariat, and be supported by professionals in the areas of social research and policy, training, event management and communications. The hub should have a strong online presence to support its objectives, which should be focused on promoting the field and drawing in students, researchers and policymakers who have an interest in it.

In the long term (5 to 10 years), the hub is expected to contribute to stimulating interest in the field and attracting talents at all career stages. Among possible actions, it could oversee an internship programme for postgraduate researchers and/or start a summer school program. It is also encouraged that it builds a programme to help establish and distribute research grants for PhDs in contemporary antisemitism and in Jewish life, as well as smaller training grants for researchers at all levels to develop methodological, policy development and knowledge transfer expertise.

For more senior scholars, the hub is expected, also in the long term, to help create new academic positions focused exclusively on contemporary antisemitism and on specific aspects of European Jewish life (history, sociology, education, literary/media studies, demography, culture, heritage, etc.) and to provide the space for these position-holders to network together, in order to increase the impact of the research. In order to improve retention and growth in the field, the hub should establish (in the long term) at least one annual prize for an outstanding established scholar in the field and for an early career researcher, to help give prominence to the field and encourage new and existing research specialists. In addition, the hub could for instance, in the long term, work with major foundations operating in countering antisemitism and in fostering European Jewish life, promote initiatives that help make existing field research accessible to researchers and policymakers, and offer grants to Jewish community organisations in Europe to fund specific research projects.

The hub should act as an interface between research (including SSH disciplines) and policy. Consequently, it should organise at least one international conference gathering researchers, community leaders and policymakers. It is strongly encouraged to set up an annual conference that should continue running beyond the end of this action. In addition, it should publish annual reports summarizing the new research and research trends in the field in a format accessible and useful to policymakers.

Given the global dimension of antisemitism, international cooperation is encouraged.

Applicants to this topic are encouraged to consider the data offered by European Research Infrastructures in the social sciences and humanities domain, in particular EHRI (European Holocaust Research Infrastructure)⁴⁷.

Given the level of ambition of the goals to be achieved, the project should have a minimum duration of 36 months.

HORIZON-CL2-2025-01-DEMOCRACY-07: The autocratic appeal: nature, drivers and strategies

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁴⁸ .

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Policymakers, public authorities and citizens at large are equipped with updated and exploitable scientific knowledge (including through SSH disciplines and fields) and understanding of the increasing autocratic tendencies, also in established democracies, including digital authoritarianism and erosion of human rights, as well as of the factors contributing to the rise of these tendencies (including the spread of disinformation in the public sphere, public disparagement of the rule of law, excessive use of police force, demonization of political opposition...).

⁴⁷ <https://www.ehri-project.eu/>

⁴⁸ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Public authorities, journalists and publics alike are provided with methods and tools capable of a) early warning and characterisation of autocratic tendencies, their drivers and strategies; and b) identifying tactics for resisting and combating them.
- Relevant actors (democratic governments, media, civil society organisations) are enabled to take more informed decisions when engaging and dealing with autocracies.

Scope: In many parts of the world, democracies are under attack. Reports and indicators⁴⁹ confirm that we are in an ongoing wave of autocratisation, with the number of autocracies increasing steadily since around the turn of the century. Instead of the announced “end of history” through the triumph of the liberal democratic order, authoritarianism seems to have gained appeal while the democratisation wave rolls back. The ongoing invasion of a democratic European country by an authoritarian regime is just one token, and consequence, of the current autocratisation wave.

How does autocracy work in the twenty-first century? Why does authoritarianism continue to spread, not only as an alternative to, but also within liberal democracy, where populist leaders frequently deploy authoritarian tactics and practices, weakening and eroding the rule of law from the inside, while continuing to gain strength and popularity? The growing acceptance of autocratic approaches in well-functioning established democracies is an under-researched phenomenon, and therefore scientific knowledge and understanding of those tendencies could contribute to the development of tools to counteract them. Social and psychological aspects, as well as philosophical and historical dimensions, will need to be considered for such an analysis. Historical experiences with autocratic regimes can shed light on commonalities and differences, so that the lessons from the past underpin current analysis and responses.

Resistance against autocratisation requires also further investigation. While not overlooking structural pre-conditions, patterns of autocratisation, as well as the motivations and strategies used by authoritarian actors, the research to be funded should also look at the actors resisting autocratisation and their strategies, investigating the modalities, actors and patterns of resistance against processes of autocratisation, so as to generate updated and exploitable scientific knowledge on this field. Could media literacy, culture, creativity and arts, for instance, play a role in stemming autocratic tendencies⁵⁰? What role is left to LGBTIQ people and religious, migrant or ethnic minorities, usually targeted by autocrats and populist leaders, in the resistance playbook against autocracies? Could the heteronormative and whitewashing activities of autocracies, visible in different domains such as culture and arts, entertainment industry, tourism or sports, be also resisted and counteracted?

Particularly striking, among those strategies to distract from persistent authoritarian practices, is the adoption of gender-equality reforms by some autocracies to boost their international

⁴⁹ For instance, those from the annual Democracy Reports published by the Varieties of Democracy Institute.

⁵⁰ The Annex to the Council Resolution on the EU Work Plan for Culture 2023-2026 (2022/C 466/01) states for instance that “cultural co-creation can authentically underpin and credibly communicate our European values, including artistic liberties and cultural rights, in large parts of the world, and thus help contain the reach of authoritarian systems.”

image. While increased autocracy and anti-democratic tendencies go hand in hand with the global setback on gender equality and sexual and reproductive health and rights, proposals should not overlook the causes and consequences of autocracies' pursuit of gender equality. This will shed light on the overall patterns and drivers of autocracies in the twenty-first century.

The resistance against autocratisation tendencies has also moved into the digital realm, in order to counteract the “digital authoritarianism”⁵¹ to which authoritarian and authoritarian-leaning leaders have resorted to. In the digital age, authoritarian power is built and sustained in transnational and globalized configurations that involve state and non-state actors, cutting across regime types. Via online censorship, internet shutdowns, digital surveillance and online disinformation and information manipulation, aspiring autocrats try to silence and disable access to information. Proposals should aim at disentangling the actor configurations engaged in digital authoritarian practices and investigate how these practices fit within the larger authoritarian playbook. In parallel, they should also focus on the challenges brought by resistance to digital authoritarianism, such as protests and investigative research and advocacy, enriching the analysis of the resistance playbook.

Proposals should investigate how to effectively protect democracies from autocratic tendencies and narratives. What means and strategies for protection are at the disposal of different stakeholders (public authorities, civil society organisations, media, citizens)? How can autocratic reforms be reversed and overcome without resorting to anti-democratic means (e.g. party bans, presidential executive orders, censoring) nor inducing large protests leading to increased polarisation?

Proposals could also look into the interrelations between the phenomena of science scepticism and science-denial, distrust in democracies and the autocratic appeal. Proposals should adopt a multidisciplinary, and actor-based, approach, integrating fields such as political science, law, sociology, philosophy, psychology, media and digital studies, gender studies, and history. Proposals should engage citizens, civil society organisations etc. in the development of their activities to ensure calibration and uptake.

The rise of autocracies and populisms in Europe is not an isolated phenomenon and needs to be looked at within a global context. Therefore, international cooperation is encouraged.

Proposals are encouraged to seek collaboration whenever possible with relevant projects selected under previous EU-funded calls, such as HORIZON-CL2-2022-DEMOCRACY-01-05, under Horizon Europe, or GOVERNANCE-03-2018, SU-GOVERNANCE-09-2020 and SU-GOVERNANCE-11-2018, under Horizon 2020. Clustering and cooperation with other selected projects under this topic and other relevant projects are strongly encouraged.

⁵¹ Understood as the practices that rely on digital technologies to prevent critical debate and accountability demands to powerholders by disrupting information flows and free expression and/or by using digital technologies to surveil citizens, activists, civil society organisations.

HORIZON-CL2-2025-01-DEMOCRACY-08: Economic inequalities and their impact on democracy

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁵².</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Enhanced understanding of the interplay between economic inequalities and attitudes towards democracies, achieved by adopting an intersectional perspective across local, national, and transnational levels and acknowledging varying territorial contexts.
- Deeper insights into economic inequalities, including citizens' own perceptions of such inequalities, across diverse demographic groups, and their impact on public participation, the shaping of attitudes for instance towards women's and minorities' rights, as well as trust in democratic processes.
- Enhanced policymakers' awareness through evidence-based policy recommendations on the relationship between economic inequalities and attitudes towards democracy, bridging research and policy by presenting data and potential solutions to foster informed discussion and adoption of targeted measures.
- Existing data are used effectively, and new data avenues are explored to better understand and address the impacts of economic inequalities across diverse demographic

⁵² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

groups, as well as citizen's own perceptions of these inequalities, on democratic participation and trust in democratic institutions.

- Novel and intersectional approaches to enhance understanding of and participation in democratic processes among economically vulnerable populations, including low- or no-income individuals, and those (at risk of) experiencing downward mobility from the middle class, integrating factors associated with social mobility and individual characteristics such as age, sex, gender, racial or ethnic origin, religion, or belief, and disability.

Scope: Economic inequalities, encompassing wealth and income inequalities (e.g., in the form of money, financial assets, or real estate), pose a significant challenge to democratic societies. Over the past decades, while between-country inequality has generally decreased, within-country inequality has risen in numerous countries as global economic growth has not been evenly distributed. This widening gap in wealth has exacerbated political polarisation and fuelled distrust in democratic institutions worldwide. These trends not only suggest correlations between these phenomena but also threaten core democratic principles such as social justice, inclusion, and equal participation and representation. For instance, extremist parties often gain traction when governments fail to protect those disadvantaged by economic changes. Research indicates that governmental shortcomings in protecting those marginalised by structural economic shifts (e.g., cuts to social security entitlements, public investment and/or tax increase) fuel the roots of populism. Understanding this cycle and the complex relationship between economic inequality and democracy is key for a functioning democratic society. Proposals are encouraged to look at the efficiency and effectiveness of public policies in addressing inequalities. For instance, examining the gap between the design and implementation phases of policies aimed at reducing economic inequalities can help better understand their impact on democracy.

Historically, economic disparities have sometimes revitalised public participation and political engagement in various forms, such as trade unions, civic involvement, and political parties. This contrasts with contemporary trends where economic inequalities often correlate with disinterest or even rejection of democracy. Hence, there is a pressing need for SSH research to delve into why, how, and to what extent economic inequalities can undermine trust in democracy and broader societal structures, and how to counteract these trends. Proposals should consider diverse territorial contexts, moving beyond urban/rural dichotomies, and explore strategies to bolster democracies in these different contexts.

Moreover, research has shown that economic inequalities, when assessed solely through economic indicators, fail to provide a comprehensive understanding of their impact on democracy. Citizens' perceptions of economic inequalities appear to play a central role in shaping attitudes towards democratic processes and institutions. These perceptions are often exacerbated by dichotomies such as rich/poor, rural/urban, employed/unemployed, educated/uneducated, and native/immigrant. There is a lack of comparative work including citizens' perceptions, particularly through an intersectional and intergenerational lens.

Therefore, research proposals should consider perceived inequalities as an integral part of the research framework.

Key research questions revolve around the intersection and impact of income and wealth inequalities on democratic practices. This involves exploring, for instance:

- How do income and wealth inequalities across different geographic and territorial areas influence policy preferences of different social and age groups, notably political polarisation, voter turnout, and trust in democratic institutions and processes.
- How perceived economic inequalities (in contrast to economic inequalities measured by quantitative indicators) influence trust and participation in democratic processes.
- How do economic inequalities intersect with social class, racial or ethnic origin, religion or belief, sex, gender, age, disability, and citizenship/nationality in different geographic areas, and what is the cumulative impact on democratic practices.
- What role do local media and community networks play in shaping perceptions of economic inequality across different regions, and how do these perceptions impact democratic engagement.
- How does geographic mobility (e.g., inter-city, rural-to-urban or vice-versa, national, international, temporary, permanent) influence the transmission of economic inequalities, and how do these processes affect participation and trust in democratic institutions.
- What strategies could address varying levels of civic engagement among people and communities from different income brackets and levels of wealth.

The funded research should also generate knowledge on intergenerational transfers, that is, inheritances and inter-vivos gifts, (perceived) inequalities, and their impact on democracy: how do these intergenerational transfers influence wealth inequality, and thus, in line with the main subject of this call, how do they impact democracy, for instance in terms of participation or trust in institutions?

When exploring economic inequalities, proposals should consider at least three additional intersecting dimensions of inequalities alongside economic ones, such as sex, gender, disability, social class, religion or belief, age, and racial or ethnic origins. For example, recent research across all EU Member States reveals that young men residing in regions marked by rising unemployment and perceived inequities in public institutions are inclined to view democratic principles like gender equality as challenges to their interests. Understanding these dynamics is crucial for addressing how economic inequalities intersect with democratic values and social attitudes.

Proposals are encouraged to involve diverse disciplinary perspectives, including but not limited to economics, political economy, political science, public administration, history, (political) sociology, (social) psychology, gender studies, and public policy. Approaches that

combine social science theories with data science techniques or incorporate novel mixed methodologies are encouraged.

Proposals should involve a diverse array of stakeholders across diverse demographic groups - encompassing different age groups, genders, minority communities, persons with disabilities, and socio-economically disadvantaged populations, including representatives from trade unions, civil society organisations, social welfare bodies, and (local) government representatives.

Applicants to this topic are encouraged to make use of the data provided by European Research Infrastructures in the social sciences and humanities domain, particularly CESSDA, the European Social Survey or SHARE.⁵³ Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

Cooperation should be sought with the Community of democracy practitioners and researchers funded under HORIZON-CL2-2024-DEMOCRACY-01-12. Moreover, proposals should build on the results of other EU projects, including the one funded under H2020-SC6-REV-INEQUAL-05-2016 - Inequalities in the EU and their consequences for democracy, social cohesion, and inclusion.

It is encouraged that proposals also exploit potential complementarities with projects funded under the following H2020 topics: REV-INEQUAL-07-2016: Spatial justice, social cohesion, and territorial inequalities; GOVERNANCE-04-2019 – Enhancing social rights and EU citizenship, and, under the following Horizon Europe topics: TRANSFORMATIONS-03-2018-2019: Innovative solutions for inclusive and sustainable urban environments; and TRANSFORMATIONS-22-2020: Enhancing access and uptake of education to reverse inequalities, as well as with Horizon Europe projects funded under HORIZON-CL2-2022-DEMOCRACY-01-03: The impact of inequalities on democracy and HORIZON-CL2-2023-DEMOCRACY-01-07: Intersectionality and equality in deliberative and participatory democratic spaces.

HORIZON-CL2-2025-01-DEMOCRACY-09: Fighting against disinformation while ensuring the right to freedom of expression

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and

⁵³ <https://www.cessda.eu/>, <https://www.europeansocialsurvey.org/> and <https://share-eric.eu/>

	selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁵⁴.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- EU institutions, national decision-makers, practitioners in relevant sectors, civil society organisations and other societal actors are better equipped to confront and prevent different forms of mis- and disinformation and information manipulation, while protecting and respecting the freedom of expression and academic freedom.
- EU institutions and national decision-makers have a better understanding of the categories of stakeholders opposing policies and initiatives aimed at combating disinformation and information manipulation, including understanding the drivers behind their narratives, and are better equipped to engage with them.
- EU institutions and national decision-makers understand how digital media shapes public opinion and regulate it without compromising citizens' rights to information, media freedom, privacy and data protection, and protection from harm.

In addition, projects should contribute to at least one of the following expected outcomes:

- Media, education and security practitioners are increasingly knowledgeable about tools and legal remedies to counteract the narratives of those opposing policies and initiatives designed to combat disinformation, and to recognise and counter their drivers.
- EU institutions and national decision-makers have a better understanding of the role of independent media and the role and importance of “media dissemination hubs” and professional “mediators” who facilitate citizens’ access to professionally produced content and analyse the crucial aspect of access to information (such as availability, accessibility, affordability, comprehensibility, transparency, inclusivity, privacy and data protection, and security).

⁵⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- EU institutions, national decision-makers, and practitioners in the media sector have a better understanding of astroturfing, its use in spreading mis- and disinformation and information manipulation, and are equipped with tools and policy recommendations to recognize and counter this phenomenon.
- EU institutions, national decision-makers, practitioners in the media sector, and other relevant societal actors have adequate educational materials to understand how to design and implement initiatives to combat mis- and disinformation and information manipulation without harming freedom of expression.

Scope: Mis- and disinformation and information manipulation can thwart political and societal responses to external challenges, such as climate change, public health, or migration. Solutions to such challenges, to be successful, must be based on evidence.

Freedom of expression is a fundamental human right that involves the right to hold and express one's opinions, as well as the right to receive and impart information and ideas, without prior authorization (censorship) or other forms of interference from the government or any other form of public authority. Therefore, freedom of expression is crucial to democracy and a key value of the European project, and it is closely linked to the role of the independent (news) media, a key pillar for checks and balances in a democratic system⁵⁵.

Proposals should investigate how the functioning of the media systems (in particular the data-driven information systems, that use data as a core component of their operation, decision-making processes, and overall functionality) favours disinformation, including gendered disinformation and anti LGBTIQ rhetoric, by creating an optimal environment for its creation, diffusion and proliferation.

Proposals are encouraged to look into the market incentives for media that promote mis- and disinformation and information manipulation, such as decline in viewers and incentives to focus on content that promotes engagement over factuality. This trend is driven by the need to catch audience attention in a competitive media landscape, which often prioritizes sensationalism and emotional reactions over accuracy.

Proposals should also explore how regulations aimed at countering disinformation can be conceived in compliance with citizens' fundamental rights, such as the right to freedom of expression, and preserving independent and pluralistic news media.

Proposals should investigate how to develop a diverse and healthy online (news) media sphere, through the design and management of trust indicators and comparison between facts and opinions on social media platforms, browsers, and websites, to help citizens, particularly children and youth, distinguish content produced with journalistic standards from non-sourced content and opinions. Such investigation should consider existing initiatives such as browser

⁵⁵ Article 11 of the European Charter of Fundamental Rights and article 19 of the Universal Declaration of Human Rights provide the guiding definitions of this right, which encompasses also the freedom of artistic expression: <https://fra.europa.eu/en/eu-charter/article/11-freedom-expression-and-information> and <https://www.un.org/en/about-us/universal-declaration-of-human-rights>

plugins and journalism trust indicators and should be developed/tested with media organisations. Therefore, research activities should involve media organisations and/or media practitioners, as well as information spreaders (individuals or entities that actively disseminate information across various platforms and channels, such as influencers, among others), in consultation and piloting activities to develop theoretical models and policy recommendations. The involvement of one or more of these categories of stakeholders is particularly important to develop innovative methodologies and solutions to counter growing phenomena, such as astroturfing. Astroturfing misleads by impersonating grassroots support through fake accounts or paid actors, amplifying visibility and public influence of misleading media content. It undermines trust in genuine online exchanges, manipulates public opinion, and reinforces echo chambers. This misuse of digital platforms spreads disinformation, undermining online debate integrity.

Proposals are also encouraged to investigate the role of professional “mediators”, i.e. individuals and entities involved in the development, structuring, and dissemination of media content: journalists, editors, producers, and broadcasters. These “mediators” play an important role in understanding and filtering information before it reaches the public and are critical in developing narratives and shaping public discourse. Moreover, proposals are encouraged to investigate the role of “media dissemination hubs”, which distribute information and influence public opinion and public discourse through news, entertainment, and other types of content (such as platforms similar to traditional media, newspapers, TV, radio, and digital channels, namely social media, news websites).

Proposals should develop policy recommendations and methodologies for how to define and provide legal safeguards for protecting open civic discourse in the face of, but not limited to, Holocaust denial, hate speech or incitement to violence.

Proposals should build on past EU-funded projects, and seek cooperation with on-going ones, as well as plan to exploit potential complementarities with project(s) funded under HORIZON-CL2-2022-DEMOCRACY-01-05 — Evolution of political extremism and its influence on contemporary social and political dialogue; HORIZON-CL2-2022-DEMOCRACY-01-06: Media for democracy – democratic media; HORIZON-CL2-2022-DEMOCRACY-01-07: Politics and the impact of online social networks and new media; HORIZON-CL3-2021-FCT-01-03: Disinformation and fake news are combated and trust in the digital world is raised. Clustering and cooperation with other selected projects under this topic and other relevant projects are strongly encouraged.

Research activities should involve a wide range of stakeholders and societal actors, including non-scientific and non-academic ones, such as, but not limited to public bodies, policymakers, private corporates, media organisations, non-governmental organisations, civil society organisations, fact-checkers, educational bodies, education and security practitioners, libraries and other cultural heritage institutions. The latter, with their extensive collections - including newspaper archives and web archives from recent decades - can provide valuable historical insights and help study the evolution of disinformation practices over time. Proposals are encouraged to make use of participative methodologies and experimental methods.

Research activities should also involve entities which are signatories of the Code of Practice on Disinformation, and entities which are subject to the Digital Services Act (DSA) and to the European Media Freedom Act (EMFA).

Research activities could also involve signatories of the Code of Conduct on Disinformation, media companies, public and private broadcasters, online news platforms, and digital services object of the European Media Freedom Act (EMFA), and other private entities, such as providers of intermediaries' services under the Digital Services Act (DSA).

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-DEMOCRACY-10: The role of civic and citizenship education for strengthening civic and democratic participation and support for common European values

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁵⁶ .
<i>Eligibility and admissibility conditions</i>	The conditions are described in General Annex B. The following additional eligibility criteria apply: In order to achieve the expected outcomes, consortia must include, as

⁵⁶ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

	beneficiaries or affiliated entities, (i) at least one secondary or higher education establishment, or public body with the capacity to roll out curricula, or public body in charge of teacher education and training; and (ii) at least one civil society organisation.
--	---

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Policymakers, education and training institutions, and educators have a better understanding of the impactful learning, teaching and assessment of citizenship education (underpinned by SSH research and evidence), including formal or formal and non-formal learning.
- Policymakers, education and training institutions, and educators gain a sound understanding of the impact of citizenship education related formal or non-formal learning on young people's (aged 15-29) civic and democratic engagement (through different forms of community and political engagement), including young people from disadvantaged backgrounds, and considering gender-specific barriers and opportunities.
- Policymakers, education and training institutions, and educators gain a sound understanding of effective collaborative mechanisms between different actors in formal and/or non-formal education sectors in delivering effective citizenship education.
- Policymakers, education and training institutions, and educators are more aware of and can roll out competence-based, transformational (fostering critical thinking and personal development) and action-oriented (fostering active civic engagement and democratic participation) pedagogical approaches to citizenship education, including innovative learning methodologies.

Scope: Education should equip young people with competences for their personal, social, professional as well as civic engagement and development, enabling them to contribute to our democracies, now and in the future, by shaping active, engaged and creative citizens who are aware of their shared values and able to improve their living environment, as recalled in the 2023 Council conclusions on the contribution of education and training to strengthening common European values and democratic citizenship⁵⁷. In the current context of growing social concerns and political polarisation, as well as in some cases insufficient engagement of young people in democratic life, we need effective educational and training tools to increase and nurture civic engagement and democratic participation and trust in democratic processes. How can different types of citizenship education (including combining formal education with non-formal or informal learning) increase the level of democratic knowledge, and encourage young people to become more involved in their communities and in democratic decision-making?

⁵⁷

[Council conclusions on the contribution of education and training to strengthening common European values and democratic citizenship](#)

This involves developing citizenship competence, in line with the 2018 Council Recommendation on key competences for lifelong learning⁵⁸, and includes, for example, building knowledge and understanding of the European common values, of citizens' obligations and responsibilities, developing critical thinking in understanding main contemporary events and history, understanding of social and cultural diversities and how national identities contribute to the European identity, an ability and willingness to constructively communicate and engage with others in common or public interest and in decision-making, as well as supporting equality and diversity, culture of peace and non-violence.

The aim of this topic is twofold. First, to understand and enhance – through innovative methodologies tested and measured by successful projects – young people's civic knowledge (understanding of democratic institutions and processes) and democratic citizenship attitudes, as well as their experiences, willingness, and opportunities to engage in their communities and participate in civic life, fostering a culture of dialogue, democratic debate, and tolerance. Second, to assess the effectiveness of the teaching methods used to promote civic knowledge, attitudes, and engagement, ensuring they contribute to the development of informed and active citizens.

Proposals are expected to consider learning in formal educational settings and can also examine non-formal educational settings (e.g. extra-curricular activities, community service projects, youth clubs etc.). While both formal and non-formal learning are relevant and interesting for the purpose of the topic, they are very different in nature, with some overlap, and would require different research methods and approaches, which can be costly. The focus of research should be on formal education, while research on non-formal education would bring an added value because of the interplay: whether and how formal education actors collaborate with non-formal education actors, for example.

Proposals should address both young people from disadvantaged and from non-disadvantaged backgrounds and should also consider the gendered aspects of young people's engagement, looking at the different barriers and opportunities for young women and men. Proposals should cover ages 15 to 29.

Proposals should also address the following aspects:

- Design, pilot and test methodologies in formal learning, or in formal and non-formal learning, such as pedagogical approaches on transformational and action-oriented learning, aimed at helping to create critically engaged participants in society, civic learning opportunities, measures related to open classroom climate or student co-creation of education institution related policies and processes (democracy-in-action learning environments). Proposals are encouraged to use mixed methods approaches combining qualitative and quantitative (e.g. small, randomized control trials to test the effectiveness of specific interventions) methods. They may include methodologies for direct youth participation in decisions that concern them, for example in school, sport, cultural

⁵⁸

[Council Recommendation on key competences for lifelong learning](#)

activities, public space, any policies in the remit of local administrations. Proposals are expected to pilot innovative methodologies, and not simply to test existing protocols. They are encouraged to include young people in the design of these innovative methodologies and may develop digital gamified pedagogical tools.

- Produce step-by-step explanations for education and training institutions, educators, national education authorities, and policymakers to roll out innovative methodologies in formal and possibly also non-formal learning, designed to create positive effects on levels of civic engagement, a culture of democratic debate, tolerance, and understanding of democratic institutions and processes. To help improve the supply and quality of democratic citizenship education, proposals are expected to develop guidelines on methodology, content and teacher training, a toolbox of pedagogical materials for teachers, and assessment tools to help identify implementation gaps.

The proposed research should also examine what educational tools and approaches need to be in place in formal, or formal and non-formal education, to equip young people for constructive participation in democratic decision-making, understanding of social and cultural diversity, readiness to support inclusive societies, and peaceful conflict resolution. Proposals may also devise (and run) ways to measure the extent to which extending the right to vote to young people aged 16 and 17 has increased their political participation (e.g. voting in elections), and what specific awareness-raising educational accompanying measures were put in place, in those countries where such measures have recently been put in place, focusing on the varying effects across different genders and intersectional demographics.

Proposals may also study where existing models and practices of civic and citizenship education may have failed (could have a negative impact or are simply insufficient) and led to a paucity of civic engagement, and a culture of polarisation rather than debate. This could include, for example, an analysis of large-scale assessments of young people's knowledge and understanding of concepts and issues related to civics and citizenship, in order to build on previous findings in the tested methodologies.

For their contributions to the outcomes of this topic to be successful, applicants must include in their consortia public authorities with the capacity to roll out curricula or institutions in charge of teacher education and training, and/or education and training institutions, in order to better understand the realities faced by those with the capacity to implement the project's findings and design adapted pilots and methodologies, and to facilitate the roll-out of the methodologies successfully tested by the project. There must also be active engagement of civil society in projects as partners, e.g. youth clubs, sports clubs, community projects, or arts and culture organisations. Testing and innovation work packages should be led or co-led by public authorities with the authority to roll out curricula or education methodologies, and/or education and training institutions, and/or educators in formal and non-formal learning.

Proposals should detail how they will develop close involvement of education bodies and practitioners in the field of democracy promotion, and in particular those involved in relevant projects that received support from other EU programmes, e.g. Erasmus+, European Solidarity Corps, CERV, or Global Europe. Proposals should explain how they will establish

connections, find synergies, and build on the work of projects funded under previous Horizon Europe Calls as, for instance:

HORIZON-CL2-2022-DEMOCRACY-01-04: Education for democracy; HORIZON-CL2-2024-DEMOCRACY-01-08: Culture, the arts, and cultural spaces for democratic participation and political expression, online and offline; HORIZON-CL2-2022-DEMOCRACY-02-01: Network for innovative solutions for the future of democracy; HORIZON-CL2-2022-DEMOCRACY-01-03: The impact of inequalities on democracy; HORIZON-CL2-2022-DEMOCRACY-01-08: Representative democracy in flux; and HORIZON-CL2-2022-DEMOCRACY-01-02: The future of democracy and civic participation.

HORIZON-CL2-2025-01-DEMOCRACY-11: Independence of the judiciary as an aspect of rule of law compliance

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁵⁹.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- EU authorities and public authorities in the Member States have access to comparative research information on the independence, impartiality and integrity of judicial institutions across the EU to ensure the rights to an effective remedy and fair trial and to strengthen accountability in the broad sense.

⁵⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Policymakers and judicial authorities have a better understanding of the functioning of the safeguards for judicial independence in each other's justice systems, also strengthening judicial cooperation between the Member States.
- Policymakers and public administrations in Member States are provided with research on the implementation at national level of international and EU rules and standards to better assess their impact on judicial independence.
- The EU's capacity to proactively promote rule of law, fundamental human rights and democracy is strengthened with a better understanding of the functioning of the safeguards for judicial independence in the Member States, including their context, current legal practice, the statutory framework, leading court cases and major relevant developments with up to date, reliable and comparable information.

Scope: Judicial independence is a principle of EU law, closely linked to the rule of law, the right to a fair trial and effective judicial protection, as guaranteed by the Treaty on European Union and the Charter of Fundamental Rights of the EU.

The EU already benefits from several tools to ensure the respect of the rule of law. These instruments serve to promote the rule of law, prevent rule of law problems from emerging, and respond to them when they materialize.

On the preventive side, one of the tools is the annual EU Justice Scoreboard which has been providing comparable data on the independence, quality, and efficiency of national justice systems since 2013. In addition, the annual European Rule of Law Mechanism, with the annual Rule of Law Report at its centre, has been providing since 2020 a qualitative assessment of significant developments in the areas of justice, anti-corruption, media independence and institutional checks and balances in every Member State⁶⁰, including specific recommendations for all Member States, aiming to prevent challenges to the rule of law from emerging or deepening.

Gaining a better understanding on the implementation of international and EU standards and its impact on judicial independence is crucial to support the EU's capacity to proactively promote rule of law, fundamental human rights, and democracy.

Reflecting on reform activities at national level and the complexity of national justice systems, proposals should contribute to improve the understanding of the functioning of the safeguards for judicial independence in each other's justice systems. This can be achieved with a multidisciplinary research approach (including research in SSH disciplines), complementing the data and analysis gathered through the annual EU Justice Scoreboard and annual Rule of Law Report.

While using a multidisciplinary approach such as a socio-legal approach, proposals should compare and critically assess national frameworks for judicial independence. Special focus should be put on how national rules, covering e.g. the procedure regarding appointments,

⁶⁰ Since 2024, the Rule of Law Report has also been covering selected candidate countries.

promotion and dismissals of judges and members of judicial administration bodies, workload assessment of judges, allocation of cases, disciplinary proceedings, and transfers of judges, work in practice.

Proposals should also contribute to building concrete knowledge on current legal practice, the statutory framework, leading court cases and major relevant developments at national level with up to date, reliable and comparable information in the Member states and in the enlargement countries.

Additionally, a comparative analysis on the independence, impartiality and integrity of judicial institutions across the EU could serve as a case to illustrate the rights to an effective remedy and fair trial, and also to strengthen accountability in the broad sense.

To support this goal, proposals should provide an outline for a comparative analysis of the safeguards for judicial independence in the Member States and, where appropriate, enlargement countries. Proposals should also highlight good practices on the implementation of international and EU rules and standards at national level.

Based on the research on the implementation of international and EU rules and standards at national level, policy recommendations could be developed to reflect on how judicial cooperation between the Member States could be strengthened.

Proposals are encouraged to network with and build on previously funded projects under the Horizon Europe⁶¹, Horizon 2020 or other EU programmes, e.g. Citizen, Equality, Rights and Values, and the Internal Security Fund (ISF)⁶². Clustering and cooperation with other selected projects under this topic and other relevant projects are strongly encouraged.

HORIZON-CL2-2025-01-DEMOCRACY-12: Community of democracy practitioners and researchers

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility</i>	The conditions are described in General Annex B. The following

⁶¹ In particular the projects funded under HORIZON-CL2-2024-DEMOCRACY-01-03: What is the long-term impact of rule of law and other European values on socio-economic outcomes.

⁶² [Citizens, Equality, Rights and Values Programme - European Commission \(europa.eu\)](#) and [Internal Security Fund - European Commission \(europa.eu\)](#)

<i>conditions</i>	<p>exceptions apply:</p> <p>If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁶³.</p>
<i>Eligibility and admissibility conditions</i>	<p>The conditions are described in General Annex B. The following additional eligibility criteria apply:</p> <p>In order to achieve the expected outcomes, consortia must include, as beneficiaries or affiliated entities, (i) at least one public body with a policy-making role, and (ii) at least one civil society organisation.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- The networking and capacity-building work of the European network set up under HORIZON-CL2-2022-DEMOCRACY-02-01⁶⁴ is strengthened and augmented.
- Research and innovation communities in the field of democracy and civic deliberation and participation and citizenship education are less fragmented and better networked across Europe.
- Researchers in democracy, including rule of law; practitioners in civic participation and deliberation; communication experts; and public authorities and governments have access to research results, innovative methodologies, and tools in the field of democracy and civic deliberation and participation and citizenship education through networking events, accessible platforms, databases, knowledge repositories, advice and capacity building on enhancing diversity and inclusion, civic participation, civic and citizenship

⁶³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁶⁴ <https://cordis.europa.eu/project/id/101112280>

education and innovative and experimental deliberation processes at all governance levels.

- Public authorities and governments practice democratic innovation, by applying research results, innovative methodologies, and tools in the field of democracy and civic deliberation and participation and citizenship education which have been distilled by the network into useful “how-tos” and trainings for policymakers, public authorities, and governments.
- Policymakers and research funding organisations are provided with proposals for future research agendas in the field of democracy.

Scope: Creating a network for researchers (including from SSH disciplines), policymakers and civil society organisations to collaborate to formulate policy recommendations and to create knowledge-sharing opportunities was the goal of the HORIZON-CL2-2022-DEMOCRACY-02-01 call topic⁶⁵: to support a necessary tool to strengthen and renew European democracy. The goal of this current call topic is to strengthen, augment, and pursue the work of the network⁶⁶ of researchers in democracy together with practitioners of civic participation and deliberation and of citizenship education across Europe, previously set up. This network should contribute to the EU’s future policy to strengthen and renew democracy.

The selected proposal will establish an innovative successor network of democracy research organisations and practitioners of democratic innovation, which will:

- Produce policy recommendations to strengthen and renew democracy in all governance levels and democratic debate in Member States and Associated Countries, drawing on the existing body of knowledge. These recommendations must be accessible, publicly available, and well disseminated including through a central open access repository.
- Help policymakers in the EU and Associated Countries to design civic participation strategies for relevant policy areas, in conjunction with the European Commission’s Competence Centre on Participatory and Deliberative Democracy⁶⁷ as relevant.
- Organise 2 retreats per year for policymakers from EU Member States, Associated Countries and EU institutions, targeting high-level officials, to learn and exchange from experts and peers on democratic strengthening and renewal, and encourage exchange on emerging or persisting challenges and threats to democracy, participation, and civic engagement.
- Design capacity building activities on inclusive participatory and deliberative forms of democracy at different governance levels, including training and knowledge sharing.

⁶⁵ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/opportunities/topic-details/horizon-cl2-2022-democracy-02-01>

⁶⁶ <https://nets4dem.eu/>

⁶⁷ https://knowledge4policy.ec.europa.eu/participatory-democracy_en

- Organise at least one conference on democratic innovations gathering researchers, practitioners, education bodies and EU and national policymakers.

Proposals should establish links to and seek complementarities with closely related actions, such as relevant R&I actions funded by Horizon Europe (such as the network established under HORIZON-CL2-2024-DEMOCRACY-01-12 ⁶⁸) or synergies with the Citizens Equalities Rights and Values programme (CERV)⁶⁹. Specifically, it must build on, rather than repeat or reproduce, the work produced by Nets4Dem under HORIZON-CL2-2022-DEMOCRACY-02-01. Proposals are also invited to build links with global communities addressing democracy.

The project should have a minimum duration of 36 months.

⁶⁸ See: <https://cordis.europa.eu/project/id/101178637>

⁶⁹ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/programmes/cerv>

actions will also assess the role intangible cultural heritage plays for fostering societal resilience amidst societal challenges.

DIGITAL: The digital transition promises enormous opportunities for Europe's cultural heritage and cultural and creative industries but also implies serious challenges. It is important to ensure that, throughout the digital transition, EU citizens enjoy cultural heritage and contribute to its interpretation and enrichment.

R&I actions will focus on how the benefits of digitised and digital cultural heritage may be exploited, reaping the benefits while avoiding the pitfalls. A particular focus will be on supporting the European Collaborative Cloud for Cultural Heritage (ECCCH), as well as on exploring challenges and opportunities of digital technologies such as artificial intelligence for culture, creativity and cultural heritage, and the ways cultural and creative industries can successfully engage with such technologies.

INNOVATIVE: To an ever-greater degree, creativity and cultural dimensions drive innovation and competitiveness – while underpinning resilience and well-being. Cultural and creative dimensions make new digital and physical products and services appealing and attractive. Similarly, societal transformations depend on behavioural changes, which are largely based on changes in lifestyle, culture and perceptions. In such processes, the human is at the centre, and cultural heritage, the arts and the cultural and creative industries are key.

R&I actions will cover a variety of subjects, such as strengthening the capacity of European design to act as a driver of sustainable competitiveness and reinforcing the role of culture and the arts for promoting European values, preventing conflicts, fostering peace and reconciliation and promoting health, well-being and social cohesion.

Many of the actions funded under this Destination will need access to and/or generate data. Where appropriate, actions should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud or included in the European Strategy Forum on Research Infrastructures (ESFRI) and the ESFRI roadmap, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of such actions is FAIR (Findable, Accessible, Interoperable and Re-usable).

The innovation ecosystems created and nurtured by the Knowledge and Innovation Communities (KICs) of the European Institute of Innovation and Technology (EIT), in particular the KIC “EIT Culture and Creativity”, may contribute to actions under this destination, and may as appropriate be considered by applicants.

In line with the Commission priorities, R&I actions under this Destination will help promote our European way of life, contribute to a Europe fit for the digital age and to achieving the European Green Deal goals, as well as support an economy that works for people. They will

contribute to the New European Bauhaus⁷² initiative, to reaching the UN Sustainable Development Goals and to building a stronger, more participatory and crisis-resilient society and economy. They will support the realisation of the full potential of cultural heritage, arts and cultural and creative industries as drivers of sustainable innovation and a European sense of belonging.

The topic ‘HORIZON-CL2-2025-01-HERITAGE-03: A European Collaborative Cloud for Cultural Heritage – Innovative use cases’ aims at supporting the digital European cultural heritage collaborative space referred to as the “European Collaborative Cloud for Cultural Heritage” (ECCCH), and contributes to the vision and objectives of the Commission⁷³.

An ex-ante impact assessment for the ECCCH was carried out between December 2021 and March 2022 by eight renowned independent experts contracted by the Commission⁷⁴. This ex-ante impact assessment examined and described the needs of a digital European cultural heritage collaborative space from the perspective of the foreseen users (cultural heritage institutions, researchers, cultural and creative industries, etc.) and of European societies, thoroughly reviewed existing initiatives that might satisfy parts of these needs, and outlined the most important aspects to consider in implementing such a collaborative space.

The conclusion of the ex-ante impact assessment is that the ECCCH is highly important to Europe’s cultural heritage institutions and to European societies. In order to address the urgent evolving needs of Europe’s cultural heritage sector in the digital age for specifically adapted collaborative spaces, the European Union is ramping up its investments through the ECCCH, and also the common European Data Space for Cultural Heritage (the Data Space)⁷⁵ funded under the Digital Europe programme. The topics under the ECCCH are based on the conclusions and recommendations of the experts’ ex-ante impact assessment.

Some key characteristics of the vision for the ECCCH include:

- The ECCCH will be addressed to professionals⁷⁶. It will enable an unprecedented level of lasting collaboration and co-creation between public and private players that will generate new realms of research, knowledge and creation of societal value.
- The basic ECCCH platform will provide easy to use tools for the most important needs.

⁷² The New European Bauhaus initiative was launched by European Commission President von der Leyen in her State of the European Union speech autumn 2020. More information here: https://europa.eu/new-european-bauhaus/index_en

⁷³ Recommendation (EU) 2021/1970 of 10 Nov 2021 on a common European Data Space for Cultural Heritage.

⁷⁴ European Commission, Directorate-General for Research and Innovation, Brunet, P., De Luca, L., Hyvönen, E., et al., Report on a European collaborative cloud for cultural heritage : ex – ante impact assessment, 2022, <https://data.europa.eu/doi/10.2777/64014>

⁷⁵ See further <https://digital-strategy.ec.europa.eu/en/library/staff-working-document-data-spaces>

⁷⁶ In the context of the ECCCH calls, ‘professionals’ should be understood as the wide and interdisciplinary group of people working with cultural heritage in a professional or semi-professional way, researchers as well as people working with related activities such as within the cultural and creative industries.

- Active user communities that contribute to training and support, as well as common data models, guidelines and libraries for developing tools (including support for Graphical User interfaces (GUI) and visualisation), will ensure that also less well-equipped institutions will draw the full benefit of the ECCCH.
- To enhance collaboration and co-creation, IPR rights of the digital objects stored in the ECCCH and produced by ECCCH-based collaboration will be fully recorded and traceable. Guidelines for the use of IPR rights, such as rights statements provided by RightsStatements.org should be used where appropriate. This will enable new business models in the intersection between cultural heritage and cultural and creative industries.
- The long-term sustainability of data and data formats is one of the underlying principles of the ECCCH. The ECCCH will tackle these challenges through its architecture and basic functionalities. The design and architecture of the ECCCH is based on three principles:
 - a. digital twins of heritage objects,
 - b. digital continuum, tracing all interactions with heritage objects and related data objects,
 - c. digital ecosystem, open to all stakeholders, professions and activities to interact with each other and with the digital heritage objects, ultimately leading towards a new generation of multidimensional, interconnected and knowledge-enhanced heritage data forming digital commons, where the ECCCH will play a key role.
- The architecture of the ECCCH will ensure an evolutionary design, which will allow the adaption and incorporation of new technologies and tools and to fulfil new user requirements, while discontinuing less used tools.
- An open Application Programming Interface will allow new functionality to be developed and incorporated in the ECCCH by different initiatives, and encourage interoperability.
- The ECCCH will be open and inclusive, both in terms of the users of the platform and the connections to other related initiatives/platforms such as the Data Space.
- The ECCCH should build on the wealth of existing knowledge, technologies and work processes in Europe. It should draw on previous experience and best practice. The ECCCH and the Data Space should complement each other towards the common vision.
- The ECCCH should ensure, through its Governance body, the engagement of a wide range of appropriate representatives from Member States and Associated Countries, as well as from related EU initiatives.

The ECCCH will thus be a genuine collaboration platform, which brings together a wide array of professions, researchers and technologies for museums and other cultural heritage

institutions. It will include and develop interactive tools for research, curation, restoration, preservation and for reaching out to citizens and cultural and creative industries, properly protect and manage IPR and allow commercial as well as non-commercial collaboration with a wide range of players.

All topics under the ECCCH are subject to the following conditions:

- All software developed should be open source, licensed under a CC0 public domain dedication or under an open source license as recommended by the Free Software Foundation⁷⁷ and the Open Source Initiative⁷⁸.
- If the use of fully open source software would require disproportional efforts or significantly diminish the quality or performance of the software, and if suitable non open source function libraries exist, such libraries may be used provided that a full user license free of charge for an unlimited period of time is granted to the consortium responsible for the ECCCH as well as to all users of the ECCCH.
- All software and other related deliverables should be compliant with the data model and the software development guidelines elaborated by the project funded under topic 'HORIZON-CL2-2023-HERITAGE-ECCCH-01-01'.
- All projects funded should participate in concertation activities with the project funded under topic 'HORIZON-CL2-2023-HERITAGE-ECCCH-01-01'

Expected impacts:

Proposals for topics under this Destination should set out a credible pathway to contributing to the following expected impact of the Horizon Europe Strategic Plan:

- The full potential of cultural heritage, arts and cultural and creative industries and sectors as drivers of both sustainable innovation and a European sense of belonging is realised through a continuous engagement with society, citizens and economic sectors.

Legal entities established in China are not eligible to participate in Innovation Actions in any capacity. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

GREEN

Proposals are invited against the following topic(s):

HORIZON-CL2-2025-03-HERITAGE-01: Co-funded European partnership for Resilient Cultural Heritage

Call: Cluster 2 Partnerships

⁷⁷

⁷⁸ <https://opensource.org/licenses>

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 60.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 60.00 million.
<i>Type of Action</i>	Programme Co-fund Action
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>Representatives of the EU institutions will be part of the evaluation committee.</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>The starting date of grants awarded under this topic may be as of the submission date of the application. Applicants must justify the need for a retroactive starting date in their application. Costs incurred from the starting date of the action may be considered eligible.</p> <p>Beneficiaries may provide financial support to third parties (FSTP). The support to third parties can only be provided in the form of grants. Financial support provided by the participants to third parties is one of the primary activities of the action in order to be able to achieve its objectives.</p> <p>As financial support provided by the participants to third parties is one of the primary activities of the action in order to be able to achieve its objectives, the EUR 60 000 threshold provided for in Article 208(a) of the Financial Regulation does not apply.</p> <p>Given the type of action and its level of ambition, the maximum amount of FSTP to be granted to an individual third party is EUR 3 million, per grant. However, if the objectives of the action would otherwise be impossible or overly difficult (and duly justified in the proposal) the</p>

	<p>maximum amount may be higher.</p> <p>The funding rate is up to 30% of the eligible costs.</p>
--	--

Expected Outcome: In line with the European Climate Law⁷⁹ and its vision for a climate-neutral and resilient Europe by 2050, this topic aims at supporting transnational activities which will enable or contribute to several expected impacts of the Horizon Europe programme and its 2nd Strategic Plan 2025-2027, in particular expected impact 8, related to realising the full potential of cultural heritage, and impact 21, related to advancing science for a fair transition to a climate-neutral and resilient society.⁸⁰ To that end, proposals under this topic should contribute to all of the following expected outcomes:

- Public funders of research and innovation actions, policy-makers and research communities are provided with a holistic and strategic research and innovation multi-annual programme of activities related to cultural heritage⁸¹ and resilience (European Partnership for Resilient Cultural Heritage, hereafter referred to as partnership), including challenges, expected impacts, outcomes, objectives, governance, and opportunities for cooperation contributing to the achievement of the relevant UN Sustainable Development Goals (SDGs)⁸² and the targets of the Paris Agreement⁸³;
- Investments in research and innovation at the intersection of cultural heritage and climate change sciences are increased and better co-ordinated between the two fields of research through the sharing of findings, data, tools and methodologies across sectors for the benefit of the society as a whole. To this end, research-based policy recommendations will be proposed to policy- and decision-makers in different sectors of governance at national and regional levels, with a view to overcoming existing fragmentation in the European Research Area (ERA);
- Research funders, businesses, policymakers, cultural heritage professionals and research communities from various scientific disciplines covered by STEAM (natural and formal

⁷⁹ Regulation (EU) 2021/1119 of the European Parliament and of the Council of 30 June 2021 establishing the framework for achieving climate neutrality and amending Regulations (EC) No 401/2009 and (EU) 2018/1999 ('European Climate Law'): <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:32021R1119>

⁸⁰ European Commission, Directorate-General for Research and Innovation, *Horizon Europe strategic plan 2025-2027*, Publications Office of the European Union, 2024, <https://data.europa.eu/doi/10.2777/092911>, p. 8.

⁸¹ Definition of cultural heritage mentioned in the Council conclusions of 21 May 2014 on cultural heritage as a strategic resource for a sustainable Europe (2014/C 183/08) and recalled in the European Framework for Action on cultural heritage: <https://op.europa.eu/en/publication-detail/-/publication/5a9c3144-80f1-11e9-9f05-01aa75ed71a1>

⁸² SDG 3 Good Health and Well-being, SDG 4 Quality Education, SDG 5 Gender Equality, SDG 8 Decent Work and Economic Growth, SDG 9 Industry, Innovation and Infrastructure, SDG 10 Reduced Inequalities, SDG 11 Sustainable Cities and Communities, SDG 12 Responsible Consumption and Production, SDG 13 Climate Action, SDG 16 Peace, Justice and Strong Institutions and SDG 17 Partnerships for the Goals.

⁸³ Council Decision (EU) [2016/1841](#) of 5 October 2016 on the conclusion, on behalf of the European Union, of the Paris Agreement adopted under the United Nations Framework Convention on Climate Change (OJ L 282, 19.10.2016, pp. 1-3); [Paris Agreement](#) (OJ L 282, 19.10.2016, pp. 4-18)

sciences, technology, engineering, arts and mathematics) and SSH (social sciences and humanities), as well as actors from different economic sectors will work towards common objectives and measures. The long-term Strategic Research and Innovation Agenda (SRIA) for the partnership will aim to demonstrate the role and potential of tangible and intangible cultural heritage in advancing Europe's climate neutrality and green transition by providing innovative and traditional knowledge-based solutions;

- A significantly strengthened scientific knowledge base at the intersection of heritage- and climate sciences contributes to more effective climate change adaptation and mitigation measures. Policy-makers and various stakeholders, including local communities, should be enabled to learn and draw lessons from the past, design and tailor risk management to specific threats and the resulting challenges for the traditions and living areas of different populations, cultural landscapes and sites, monuments, intangible cultural heritage and other assets, such as museums, libraries and archives collections under their responsibility;
- European cultural heritage professionals and stakeholders will engage with a wide range of partners from the EU, Associated Countries and worldwide, in the research and innovation actions under the partnership to address the global challenges of climate change, deploy good practices and enhance cultural heritage transnational research, its societal impact and Europe's leading position in the field of cultural heritage and climate neutrality.

Scope: The challenge of cultural heritage lies in preserving and safeguarding a society's rich history, traditions, artefacts, and knowledge. This involves addressing issues such as deterioration, damage, theft, conflict, changing societal values and new challenges such as the climate change. In addition, it is essential to strike a balance between accessibility for future generations and respect for cultural sensitivities.

Proposals for the co-funded partnership on resilient cultural heritage must aim to enhance efforts to better understand and mitigate the effects of the triple planetary crisis (climate change, pollution and biodiversity loss), with focus on the impact of climate change on tangible and intangible cultural heritage, in line with the EU's cultural and environmental policies, embodied in the Creative Europe programme and the European Green Deal.⁸⁴

The partnership will focus on resilience as the individual and collective capacity to anticipate, respond and adapt to situations where the protection and safeguarding of cultural heritage becomes more challenging due to increased risks of loss and damage. At the same time, the potential of cultural heritage to support resilience needs to be harnessed, as cultural heritage has a strong societal, environmental, economic ,psychological and well-being dimension and

⁸⁴ Regulation (EU) 2021/818 of the European Parliament and of the Council of 20 May 2021 establishing the Creative Europe Programme (2021 to 2027) and repealing Regulation (EU) No 1295/2013: <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32021R0818>; European Commission, Directorate-General for Communication, *European green deal – Delivering on our targets*, Publications Office of the European Union, 2021, <https://data.europa.eu/doi/10.2775/373022> ; [Legal documents on Delivering the European Green Deal - European Commission \(europa.eu\)](https://data.europa.eu/doi/10.2775/373022)

contributes to the construction and preservation of individual and collective identity and acceptance of incoming changes.

Through its ability to bring together different stakeholders (e.g. research funders, cultural heritage authorities and professionals, citizens, innovators, policy-makers), the partnership will create a critical mass of resources to implement a long-term Strategic Research and Innovation Agenda (SRIA), building on the work of the Joint Programming Initiative (JPI) Cultural Heritage and the ARCHE Coordination and Support Action funded under Horizon Europe 2021 call for proposals in Cluster 2. Proposals should build on existing knowledge, activities and networks, notably the ones funded by the European Union, to the extent appropriate. The input of other ERA entities such as HERA⁸⁵, CHANSE⁸⁶, the JPI Climate⁸⁷ may be considered.

Proposals should in addition take into account the findings of the first-ever European Climate Risk Assessment (EUCRA) report⁸⁸, which calls for decisive evidence-based actions to prevent lock-in in maladaptive pathways to address climate-related risks, such as in land-use planning and long-lived infrastructure. The partnership is expected to contribute to the Communication *Managing climate risks - protecting people and prosperity*, which requires improving the science base for future adaptation actions and aims to foster innovation and build resilience.⁸⁹ The partnership should also develop its activities considering the 8th Environment Action Programme Mid-Term Review as published in March 2024.⁹⁰

Given that climate change is leading to an increase in the frequency, intensity and complexity of natural disasters within the Union and worldwide, the partnership should in addition contribute to achieving the objectives of the Union Civil Protection Mechanism⁹¹, which includes a focus area on cultural heritage when protecting people, environment and property against natural and man-made disasters in a spirit of international solidarity, through practical cooperation and coordination.

The partnership should be implemented through a joint programme of activities ranging from coordinating transnational research efforts to other activities such as improving access to data and services, optimising the use of and services provided by research infrastructures, as well as networking, capacity building, training and dissemination activities.

In the preparation of topics for the partnership's transnational calls for proposals and additional activities, due attention should be paid to the gender dimension and the

⁹¹ Decision No 1313/2013/EU of the European Parliament and of the Council of 17 December 2013 on a Union Civil Protection Mechanism (OJ L 347, 20.12.2013, p. 924) and Regulation (EU) 2021/836 of the European Parliament and of the Council of 20 May 2021 amending Decision No 1313/2013/EU on a Union Civil Protection Mechanism (OJ L 185, 26.5.2021, p. 1); <https://eur-lex.europa.eu/eli/reg/2021/836/oj>

intersectionality of grounds for potential discrimination such as disability, age, socio-economic status, racial or ethnic origin, nationality, sexual orientation, etc., in order to be in line with EU anti-discrimination policy⁹² and to achieve meaningful and significant outcomes that enhance the societal impact of the relevant activities. The advice of gender experts should be taken into account in developing mitigation and adaptation measures at the nexus of cultural heritage and climate change, in examining the functions of cultural heritage and related societal values, and in supporting sustainable development.

Taking all aforementioned priorities and references into account, the partnership should aim to:

- Build capacity by fostering fundamental and applied interdisciplinary collaborative research (SSH and STEAM) between the cultural heritage and climate research communities.
- Provide resources and incentives to conduct holistic research and nurture collaborative actions to drive the transformation towards more sustainable development, just futures and a healthier way of life and overall well-being.
- Create and disseminate new knowledge, techniques, skills, strategies and materials for sustainable preservation, conservation, and management of climate-related risks in the cultural heritage field as well as other man-made related risks.
- Promote innovations in industries and to provide scaled-up solutions and applications for climate change mitigation and adaptation.
- Develop a coherent methodology for obtaining reliable information, quantitative and qualitative data on cultural heritage and climate change, as well as on the costs and benefits of adaptation measures, with particular emphasis on processes and life cycles related to the circular economy.
- Improve long-term monitoring of cultural heritage through the use of innovative technologies and risk management models to document, inventory and predict the negative and positive impacts of climate change on and through cultural heritage.
- Integrate cultural heritage into mainstream climate change and environmental regulations, policies and adaptation strategies by operationalising heritage-based solutions and knowledge of the past.
- Provide policy recommendations to enhance social cohesion and the European sense of belonging through cultural heritage in communities and societies impacted by climate change.

⁹² A Union of Equality: Gender Equality Strategy 2020-2025, COM(2020) 152 final, <https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52020DC0152>

- Encourage the continued conservation and preservation (through maintenance) by involving, educating and facilitating community participation, with a special focus on sustainability and a quality approach.
- Increase collaboration across countries and regions and to move away from a focus on individual geopolitical regions to overcome the fragmentation of the wide landscape of stakeholders, competences, resources, policies, programmes and initiatives.

The partnership is open to all EU Member States and countries associated to Horizon Europe and will remain open to third countries wishing to join.⁹³ Partners are expected to contribute financially and/or in kind, depending on the level of ambition of the proposed activities. The partnership should be open to new partners throughout its lifetime. Important note: the EU contribution will not be increased accordingly.

The partnership should include or engage with the following stakeholders: (i) ministries responsible for R&I policy, as well as national and regional R&I and technology funding agencies and foundations; (ii) ministries responsible for cultural heritage, education, environment, spatial planning and development, tourism, etc., as well as other relevant national and regional authorities, organisations and providers; (iii) research infrastructures such as the European Research Infrastructure for Heritage Science (E-RIHS); (iv) industry; and (v) charities and other non-profit organisations, for example of end-users of cultural heritage assets, active in safeguarding cultural heritage and/or in adapting to or mitigating the effects of climate change.

The governance structure of the partnership should implicate the relevant stakeholders in advance to coordinate, guide and mentor the research and innovation activities and facilitate the use and uptake of the results. The partnership's activities should give rise to ready-to-use solutions. The governance structure should involve key stakeholders, including, but not limited to, the research and innovation community and cultural heritage professionals from sectors relevant to the scope of the partnership. In order to enhance the societal impact of the activities, the approach should empower citizens to contribute to the co-design/co-creation/co-assessment of research and innovation agendas/contents/outcomes.

To ensure coherence and complementarity of activities and leverage knowledge and investment possibilities, the partnership is expected to establish relevant complementarities with other Horizon Europe actions under relevant Clusters of Pillar II, partnerships and missions, such as “Adaptation to climate change – Climate-ADAPT”, “Restoring our ocean and waters by 2030”, “Biodiversa+”, “Climate-neutral and smart cities”, “Built4People”, and the “New European Bauhaus” Facility.⁹⁴

Proposals should be complementary to ongoing Horizon Europe projects to ensure the complementarity of deliverables and outcomes, where appropriate. Proposals should include a

⁹³ The Global Approach to Research and Innovation *Europe's strategy for international cooperation in a changing world*, COM(2021) 252 final

⁹⁴ Working document on ‘Coherence and Synergies of Candidate European Partnerships under Horizon Europe’;

budget for the attendance of regular joint coordination meetings and may consider covering the costs of any other joint activity, without the prerequisite to detail concrete joint activities at this stage. The partnership will be encouraged to develop cross-fertilisation links with projects funded since the beginning of Horizon Europe notably under Cluster 2, following the call topics within the Green priority of Destination 2, topics relating to the European Collaborative Cloud for Cultural Heritage (ECCCH) or projects such as those selected on the basis of topics HORIZON-CL2-2021-HERITAGE-01-01 – Green technologies and materials for cultural heritage⁹⁵, HORIZON-CL2-2022-HERITAGE-01-08 - Effects of climate change and natural hazards on cultural heritage and remediation⁹⁶, or HORIZON-CL2-2023-HERITAGE-01-01: Advanced technologies for remote monitoring of heritage monuments and artefacts⁹⁷.

Proposals should also explore how to co-operate with other relevant EU and international actions and describe specific activities envisaged. They could propose to facilitate interactions and knowledge transfer with various economic sectors such as: cultural and creative sectors and industries (CCIs), agricultural and forestry policy, blue economy sectors, sustainable tourism, circular economy, infrastructures and construction, as well as society changes and transitions; urbanisation, spatial planning, regional growth, sustainable tourism development.⁹⁸

Moreover, proposals should consider synergies with different EU programmes, including EU space programmes (Copernicus, Galileo) to foster the use of emerging or operational space technologies for policy development, and the Digital Europe programme.⁹⁹ Cooperation with the JRC may be envisaged, in particular for actions related to monitoring monuments, cultural heritage sites and cultural landscapes. The partnership should align with EU-wide initiatives on open access and FAIR data (findable, accessible, interoperable and re-usable).

The partnership should be linked to the European Institute of Innovation and Technology's Knowledge and Innovation Community - EIT Culture & Creativity as there is a common aim to scale up and widen to as many Member States/Associated Countries as possible a culture and creativity-driven European innovation ecosystem.

Proposals may include synergies between Horizon Europe and European Regional Development Fund (ERDF) programmes, including Interreg programmes, since Horizon Europe seeks to promote synergies with other EU programmes and to combine Horizon Europe funding with other EU, national or regional funding instruments in the same

⁹⁵ https://cordis.europa.eu/programme/id/HORIZON_HORIZON-CL2-2021-HERITAGE-01-01/en

⁹⁶ https://cordis.europa.eu/programme/id/HORIZON_HORIZON-CL2-2022-HERITAGE-01-08/en

⁹⁷ https://cordis.europa.eu/programme/id/HORIZON_HORIZON-CL2-2023-HERITAGE-01-01/en

⁹⁸ See above and European Cultural Heritage Green Paper produced by Europa Nostra in close cooperation with ICOMOS and the Climate Heritage Network, with the input of other members of the European Heritage Alliance, and supported by the European Investment Bank Institute and the Creative Europe EU programme. <https://www.europanostra.org/our-work/policy/european-cultural-heritage-green-paper/>

⁹⁹ Regulation (EU) 2021/694 of the European Parliament and of the Council of 29 April 2021 establishing the Digital Europe Programme and repealing Decision (EU) 2015/2240 (OJ L 166, 11.5.2021, p. 1–34); <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32021R0694&qid=1623079930214>

operation, project or initiative in order to achieve greater impact and efficiency (cumulative/complementary funding).¹⁰⁰

To address the ambitious challenges in front of the partnership, cooperation with international organisations, the private sector and non-European institutions and experts may be considered. The participation of third countries is encouraged but their commitment to the partnership would not be taken into account for the calculation of EU funding. Applicants should describe in their proposal the methodology for their cooperation and the objectives they wish to achieve by joining the partnership.

Proposals should pool the necessary financial resources from the participating national (or regional) research programmes with a view to implementing joint calls for transnational proposals resulting in grants to third parties. It is expected that the partnership organises joint calls on an annual basis and will therefore have sufficient time to carry out the co-funded projects.

The total indicative budget for the partnership is up to EUR 60 million and subject to the effective implementation of the financial commitments made by the members of the consortium.

The expected duration of the partnership is seven to ten years.

HORIZON-CL2-2025-02-HERITAGE-02-two-stage: Innovative approaches to intangible cultural heritage for societal resilience

Call: Culture, Creativity and Inclusive Society - 2025 - Two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 12.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions

¹⁰⁰ Annex IV to Regulation (EU) 2021/695 establishing Horizon Europe. - the 2022 Commission Notice on ‘Synergies between Horizon Europe and ERDF programmes’ (2022/C 421/03)(2022/C 421/03); - the 2014 Commission guidance document on ‘Enabling synergies between European Structural and Investment Funds, Horizon 2020 and other research, innovation and competitiveness-related Union programmes’; - the European Court of Auditors’ Special Report No 23/2022 ‘Synergies between Horizon 2020 and European Structural and Investment Funds – Not yet used to full potential’

	under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹⁰¹ .
--	--

Expected Outcome: Projects should contribute to the following expected outcome:

- Policymakers are provided with a multi-dimensional overview and assessment of intangible cultural heritage (ICH) role in contemporary societal challenges and European social, economic, and cultural dynamics. A comprehensive analysis of ICH's potential for societal resilience and its contribution to climate change mitigation and adaptation becomes available.

Additionally, proposals should contribute to at least two of the following expected outcomes:

- Policymakers (at all levels), public authorities and stakeholders have access to an array of innovative practices, strategies, and tools for incorporating ICH in community resilience planning, for ICH innovative safeguarding and for expanding community engagement with ICH practice, safeguarding, and communication. This includes awareness of gender dynamics in ICH practices.
- Innovative policies aimed at preserving ICH amid disasters, conflicts, migration, and population displacements are supported by data and knowledge.
- New methodological approaches and tools using digital technologies for documenting, communicating, and transmitting ICH become available. Community engagement with ICH, particularly among youth, crucial for sustainable and intergenerational transmission of living cultural practices, is broadened. The alliance between communities and researchers is strengthened. The involvement of education and heritage preservation institutions and agencies is enhanced.
- The sustainable use of ICH as source of inspiration for creative designs and practices, to spur sustainable development and provide a valuable resource to communities, e.g. for attracting cultural tourism, is enhanced. Measures to prevent overuse, inappropriate use, and depletion are strengthened.
- A future research agenda is devised for sustainable ICH practices respecting cultural diversity, human rights, and gender equality; cultural aspects of societal resilience will be addressed.

¹⁰¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: Intangible cultural heritage (ICH) includes traditions, oral histories, performing arts, social practices, rituals, festive events, as defined by UNESCO¹⁰². ICH represents a repository of traditional knowledge and forms the backbone of a community's identity and continuity.

Societal challenges such as globalization, urbanization, migration, conflicts, disasters, and climate change significantly threaten the safeguarding and transmission of these cultural legacies. Additional threats include rural depopulation, an ageing society, and a growing disconnection between older and younger generations¹⁰³. Research on ICH is dynamic but noteworthy gaps exist. There is a need for comprehensive risk assessments on the impact of societal challenges and climate change on ICH, including the erosion of cultural practices due to migration, displacement, or to a changed living environment.

A crucial under-researched area is the role of ICH in strengthening resilience against societal challenges and disasters and in fostering climate change mitigation and adaptation measures. Traditional knowledge systems and practices developed over generations by communities, including indigenous communities, and embedded within ICH, provide insights for sustainable natural resource management and adaptation strategies tuned to local ecosystems. This includes identifying natural hazard risks, disaster response, and post-disaster restoration of social and natural environments. Additionally, ICH practices such as rituals, storytelling, or traditional craftsmanship, help preserve cultural identity while enhancing mental health and quality of life, contributing to social well-being, community resilience, and recovery efforts.

In parallel, there is an urgent need for innovative approaches to sustain and revitalize ICH by fostering participatory approaches that actively involve communities, with particular attention to young people, whose engagement is key for safeguarding and transmitting ICH. Furthermore, strengthening research-community collaboration and involving the education sector are essential for co-creating knowledge and innovation with concrete societal impacts. Potential areas for exploration include innovative methods to promote and safeguard ICH, and bridging gaps in heritage roles, including women's contribution in the safeguarding and transmission of ICH. Advanced digital technologies, including artificial intelligence, can innovate support for ICH through sustainable documentation, safeguarding, and dissemination, including through immersive experiences, and respecting the balance between safeguarding and evolution. Consideration should be given to preserving audiovisual collections which serve as carrier of ICH and capture its history and evolution. Proposals might consider leveraging the digital platform and tools provided by the European Collaborative Cloud for Cultural Heritage¹⁰⁴.

¹⁰² Convention for the safeguarding of the intangible cultural heritage (2003) <https://ich.unesco.org/en/convention>. Proposals may adopt a broader definition of intangible cultural heritage, supported by a solid scientific foundation.

¹⁰³ UNESCO highlighted in a visual the phenomena threatening intangible cultural heritage, grouping them into nine categories <https://ich.unesco.org/dive/threat/?language=en>.

¹⁰⁴ In addition, where applicable, proposals can leverage the data and services available through the research infrastructures included in the European Strategy Forum on Research Infrastructures (ESFRI) and the ESFRI roadmap and those federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that any data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

Leveraging ICH through sustainable practices can contribute to sustainable development. ICH reveals ways of living that are less resource demanding. For example, traditional building techniques can inspire sustainable architectural designs; centuries-old agricultural practices can inform organic farming; and traditional crafts, music, and folklore can drive innovation in fashion, product design, and the arts. By integrating intangible cultural elements into modern practices, communities can create globally resonant, high-value products while keeping their cultural significance. Cultural tourism, centred around ICH, can boost local economies, and foster intercultural dialogue. Maintaining the integrity of ICH and preventing depletion is essential, as is ensuring the sustainability and fair distribution of benefits from ICH among the community.

Proposals should consider involving communities bearing and practicing intangible cultural heritage alongside with researchers and other stakeholders. Proposals should build on existing knowledge, activities, and networks, notably those funded by the European Union. They should complement ongoing Horizon Europe projects and are expected to liaise with the European Partnership on Resilient Cultural Heritage (see HORIZON-CL2-2025-03-HERITAGE-01).

The Commission expects funded projects to regularly coordinate with relevant Cluster 2 projects (including those under the European Partnership on Resilient Cultural Heritage) to ensure complementarity of deliverables and outcomes, where appropriate.

DIGITAL

HORIZON-CL2-2025-01-HERITAGE-03: A European Collaborative Cloud for Cultural Heritage – Innovative use cases

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.50 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 26.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>

<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁰⁵.</p> <p>Beneficiaries may provide financial support to third parties to cultural heritage institutions, in take-up of tools, technologies and for populating and validating the relevant use cases through experiments. A maximum of 15% of the budget may be dedicated to financial support to third parties. The maximum amount to be granted to each third party is EUR 60 000.</p>
---	---

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Findings from thorough end-to-end testing based on real use cases contribute to a seamlessly working, user-friendly, inclusive and powerful European Collaborative Cloud for Cultural Heritage (ECCCH).
- By documenting and communicating the use cases deployed, a wide collection of innovative uses of the ECCCH is elaborated, which contributes to exemplify and illustrate its benefits and attract new users and user groups.
- By identifying and implementing improvements and engaging with users, significant contributions are made for the ECCCH to be widely used by European cultural heritage professionals and researchers, enabling new ways to interact, cooperate and co-create, thus supporting the generation of new knowledge and opening of new research paradigms.

Scope: This topic aims at implementing real use cases and carrying out demanding end-to-end testing of the platform and its tools, in order to verify its capabilities and improve the ECCCH.

The activities carried out should focus on concrete use cases, undertaken by the participating institutions, professionals and researchers with a view to improve their results or work processes.

¹⁰⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

The activities carried out should make use of several of the key features of the ECCCH, including the user tools implemented on it¹⁰⁶. Such key features may include use of the advanced digital twins, of the large-scale cooperation and co-creation features, of the digital continuum or of the advanced features for commercial cooperation with, for example, cultural and creative industries¹⁰⁷. Activities carried out may also focus on the seamless interconnection of the ECCCH with other related platforms such as the Common European Data Space for Cultural Heritage and the European Open Science Cloud. Proposals should outline a focus of the planned activities that best achieve the expected outcomes, which may include some of the aspects mentioned.

Activities should involve a wide range of different organisations from across Europe, in accordance with the focus chosen. Entities from at least five different Member States or Associated Countries should be involved as active users of the ECCCH platform. Also, entities of different characteristics should be involved, such as small and large organisations, from different subsectors/areas of activity or scientific disciplines, etc.

The activities carried out and the results generated should be properly documented so as to serve as a good base for improvements or corrections of the platform and/or of the user tools implemented on it, and also for communicating innovative uses of the ECCCH. Contributions should be made to extend the user base of the ECCCH by promoting use cases and outreach activities, possibly together with or coordinated with other ECCCH projects.

Projects funded under this topic may build on testing or other activities carried out by other ECCCH projects, but must not duplicate activities that are funded under other ECCCH projects. Activities should add new value to the ECCCH. Therefore, projects funded under this topic should coordinate closely with previously funded ECCCH projects and provide for sufficient flexibility so as to avoid duplication and ensure that the activities carried out offer important contributions to validate and improve the platform.

Proposals should foresee own capacity to implement important improvements and fix problems detected. Such modifications or extensions of the ECCCH platform functionality should be carried out in accordance with the data model and the software development and documentation guidelines of the ECCCH, established by the project funded under topic HORIZON-CL2-2023-HERITAGE-ECCCH-01-01¹⁰⁸. All software and other related deliverables should be compliant with the guidelines elaborated by the project funded under topic HORIZON-CL2-2023-HERITAGE-ECCCH-01-01, and should be implemented in compliance with the design of the ECCCH, using the low-level libraries established by the project funded under topic HORIZON-CL2-2023-HERITAGE-ECCCH-01-01.

¹⁰⁶ For an orientation of the range of user tools being developed, please refer to the previous ECCCH call topics in the Horizon Europe Cluster 2 Work Programmes 2023 and 2024.

¹⁰⁷ The key features of the ECCCH are further explained in the Destination introduction text and in the 'Report on a European collaborative cloud for cultural heritage - Ex – ante impact assessment' available here:

<https://op.europa.eu/en/publication-detail/-/publication/90f1ee85-ca88-11ec-b6f4-01aa75ed71a1/language-en>

¹⁰⁸ See further <https://cordis.europa.eu/project/id/101157364>

All software developed should be open source, licensed under a CC0 public domain dedication or under an open-source licence as recommended by the Free Software Foundation¹⁰⁹ and the Open-Source Initiative¹¹⁰. If the use of open source software components would require disproportional efforts or significantly diminish the quality or performance of the software, proprietary components may be used provided that: An open functional replacement is available; they do not introduce proprietary data formats or Application Programming Interfaces; a full user license free of charge for an unlimited period of time is granted to the consortium responsible for the ECCCH and all its users. Applicants should state clearly if all developed software will be open source, and if not clearly explain the reasons.

To the extent that data is produced, efforts should be made to ensure that it is FAIR (Findable, Accessible, Interoperable and Re-usable). To the extent that new or modified interoperability standards need to be developed for data sharing within and across data ecosystems, these should build on the FAIR data principles and leverage already adopted practices, especially those in the relevant European common data spaces and in the European Research Infrastructures.

Financial support to third parties may be used to facilitate the engagement with ECCCH users beyond the project consortium. The financial support to third parties can only be provided in the form of grants.

In order to ensure good coordination among the different ECCCH projects, proposals should make provisions to actively participate in the common activities of the ECCCH initiative. Projects funded under this topic should coordinate technical work with the relevant projects funded under other call topics of the ECCCH initiative, and contribute to the activities and objectives of the project funded under the topic HORIZON-CL2-2023-HERITAGE-ECCCH-01-01. Proposals should include a budget for the attendance to regular joint coordination meetings, and may consider covering the costs of any other joint activities without the prerequisite to detail concrete joint activities at proposal stage.

Projects funded under this topic should set up their project websites under the common ECCCH website, managed by the project funded under topic HORIZON-CL2-2023-HERITAGE-ECCCH-01-01.

The Commission expects the different projects funded under this topic to establish regular coordination mechanisms in order to ensure synchronised planning, as well as synergy and/or complementarity of deliverables and outcomes, where this is appropriate.

The Commission estimates that a project duration of approximately 2 – 2.5 years is appropriate for the projects funded under this topic.

Please also refer to the Destination introduction text to consider some key characteristics of the vision for the ECCCH.

¹¹⁰ <https://opensource.org/licenses>

HORIZON-CL2-2025-01-HERITAGE-04: Leveraging artificial intelligence for creativity-driven innovation

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 15.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹¹¹.</p>

Expected Outcome: Projects should contribute to at least three of the following expected outcomes:

- Policy makers, Cultural and Creative Industries (CCI)¹¹² and other stakeholders gain insights into the impact of AI, including, but not limited to, generative AI, on artists, creatives, cultural professionals, creative businesses and on the market for cultural and creative goods and services, as well as on the future of creative work.
- Policy makers, research (including SSH disciplines), education, industry, and society benefit from robust, evidence-based policy recommendations and concrete solutions promoting a mutually beneficial interplay between CCI and AI. These policy

¹¹¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹¹² “Cultural and creative industries are those industries that are based on cultural values, cultural diversity, individual and/or collective creativity, skills and talent with the potential to generate innovation, wealth and jobs through the creation of social and economic value, in particular from intellectual property; they include the following sectors relying on cultural and creative inputs: architecture, archives and libraries, artistic crafts, audiovisual (including film, television, software and video games, and multimedia and recorded music), cultural heritage, design, creativity-driven high-end industries and fashion, festivals, live music, performing arts, books and publishing (newspapers and magazines), radio and visual arts, and advertising” European Parliament resolution of 13 December 2016 on a coherent EU policy for cultural and creative industries (2016/2072(INI))

recommendations and solutions aim for a fairer marketplace that fosters transparency, fairness, non-discrimination, diversity, and accountability by design, while respecting artistic freedom.

- Policy makers, the CCI, and stakeholders are provided with case studies and evidence-based policy recommendations to harness the CCI's potential for AI innovation and promote human-centric, unbiased AI applications.
- Frameworks, protocols, and tools for managing intellectual property and personality rights in AI development, training, and use, addressing unauthorised data use and legal breaches, are available to CCI and public authorities.
- Mechanisms or platforms, such as CCI-led competence centres or hubs, are proposed to facilitate interaction among artists, creatives, AI specialists, cultural institutions, and creative businesses. These will facilitate the sharing of knowledge and experiences on AI-powered innovations and aim to develop new solutions that serve the needs of the CCI and society at large, ultimately enhancing creativity-driven innovation.

Scope: The rapid development and deployment of artificial intelligence are increasingly permeating and transforming economy and society, notably impacting the diverse and dynamic domains of the CCI which, notably, are predominantly composed of SMEs. This transformation offers significant opportunities for innovation, within the CCI and in the economy and society at large, and poses challenges including bias, ethical dilemmas, employment shifts, skills need, and issues related to data access, transparency, preservation of cultural diversity and respect for creators' rights.

To foster a culture- and creativity-driven European innovation ecosystem, it's crucial to understand and address these impacts, build capacity to steer development, anticipate consequences, and prepare the CCI with the necessary skills to thrive in the new scenario. Enhancing the capabilities of the CCI in this rapidly evolving landscape increases innovation potential at the intersection of technology, arts, culture, and society.

Initiatives at the crossroads between art, technology, science, and society, such as the EU's STARTS – Science, Technology, and the Arts – demonstrate the advantages of involving artists and creative professionals to advance innovation and develop technologies that resonate with individuals and reflect cultural diversity. Artistic skills like intuition, imagination, and creativity, which are challenging for AI to replicate, along with expertise in design, visualisation, storytelling, to mention just a few, provide fresh ideas and unique insights for creating human-centric AI tools that address specific challenges and are designed to be ethical, sustainable, trustworthy, culturally sensitive and enhance user experience.

To address the multifaceted intertwining between AI and the CCI, and to foster a sustainable, innovative environment, the following areas could contribute to this topic's expected outcomes:

- Explore the impact of AI - including generative AI, and emerging AI systems - on CCI markets and audiences, ranging from individual artists and creators to processes, services, products, and consumer interactions.
- Investigate AI's current and potential applications within CCI that enhance creativity, innovation, and competitiveness.
- Focus on AI integration in those cultural and creative industries where it is most disruptive or most needed to optimise processes and reap business opportunities, identifying key risks, changes in employment and job profiles, and the need for upskilling, reskilling, and capacity building.
- Develop a sound understanding of how the intersection of CCI and AI can drive innovation both within the CCI and across other sectors, promoting business processes that respect and promote cultural diversity, foster the discoverability of European content and protect and reward human creativity.
- Investigate the underexplored potential of creativity and the arts to engage with AI developments and collaborate with AI specialists and third parties when appropriate. This can aim to design trustworthy, ethical, user-friendly intelligent systems that meet people's needs, enhance user experience, safeguard cultural diversity, address biases (including biases towards gender, sex, age, race or ethnicity, sexual orientation, and migrant status) boost CCI's competitiveness, and promote societal adoption of AI.
- Develop pilots, guidance, and innovative toolkits, including use cases, checklists, and algorithms, addressing CCI needs and values, cultural diversity, and the protection of intellectual property rights, including copyright and related rights.
- Facilitate interaction among artists and creatives, AI developers, cultural institutions, creative businesses, and third parties as appropriate, to promote knowledge transfer and enhance AI-powered innovation in CCI.
- Provide mechanisms or platforms for collaborations, peer learning, and knowledge sharing to build capacity and foster creativity-led innovation, while integrating humanistic perspectives into AI through dialogues that blend creativity and the arts with AI communities within research, policy, and practice.
- Assess the role cultural organisations can play in training AI systems in their areas of competence to represent multilingualism and cultural diversity in digital environments and to foster accessibility, and the extent to which AI contributes to their value creation, enhancing traditional methods and practices and personalising engagement with their public.
- Devise strategic recommendations for policies and practices that foster a mutually beneficial relationship between AI and CCI, propose fair rights management solutions and address employment, skills, and innovation challenges.

Proposals should involve from the outset representatives from the CCI, including the arts and cultural heritage, to ensure their central role in activity development. Proposals need not cover all CCI but may focus on a specific area for thorough analysis to develop a strong knowledge base and highlight strategic directions and routes to improvement.

Proposals should, to the extent appropriate, build on existing knowledge, activities, and networks, especially those funded by the European Union. They should seek complementarities with relevant projects funded under Horizon Europe Clusters 2 and 4¹¹³ and explore synergies with projects dealing with AI and the cultural and creative sectors and industries, funded by other EU programmes like Creative Europe, and Digital Europe.¹¹⁴

HORIZON-CL2-2025-01-HERITAGE-05: Evolution of culture in a virtualising world

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.50 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹¹⁵

¹¹³ For example: HORIZON-CL2-2024-HERITAGE-01-03: Leverage the digital transition for competitive European cultural and creative industries; HORIZON-CL2-2024-HERITAGE-01-02 and HORIZON-CL2-2023-HERITAGE-01-02: Cultural and creative industries for a sustainable climate transition; HORIZON-CL4-2021-HUMAN-01-24 - Tackling gender, race and other biases in AI.

¹¹⁴ Proposals can leverage the data and services available through the research infrastructures included in the European Strategy Forum on Research Infrastructures (ESFRI) and the ESFRI roadmap and those federated under the European Open Science Cloud, as well as data from relevant Data Spaces, including the common European data space for cultural heritage. They could also explore digital infrastructures, including the Alliance for Language Technologies European Digital Infrastructure Consortium (ALT-EDIC). Any data produced in the context of this topic should be FAIR (Findable, Accessible, Interoperable and Re-usable).

¹¹⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- A deepened understanding is developed and made available to researchers (including from SSH disciplines), policy-makers and industry professionals of the possible key long-term impacts on culture¹¹⁶ when citizens spend ever more time and experience an ever-larger share of life events in virtual worlds¹¹⁷, including benefits and risks in relation to human wellbeing, European values, social cohesion and cultural and linguistic diversity.
- Research and knowledge-based measures with a long-term view are developed and put in practice that guide development towards realising the opportunities linked to the virtualisation of life while mitigating the most important threats.
- Significant contributions are made towards making Europe a global leader in virtual worlds that contribute to wellbeing, social cohesion and resilience in addition to competitiveness and growth.

Scope: As technology improves, attractive content is developed and virtual worlds become more accessible, European citizens will spend ever more time and experience an ever larger share of important life events in virtual and blended environments. Leading multinational companies as well as the European Union are making great efforts to accelerate this development, whereby it is the ambition of the European Union to create a thriving and world-leading European industrial ecosystem for virtual worlds¹¹⁸.

As life thus becomes ever more virtualised, in the long term this will inevitably lead to drastic changes in perceptions, beliefs, behaviours and values. Culture will evolve; possibly new elements of culture will be born while old ones disappear. Creativity, cultural production and access to culture will have an ever-greater virtual component, changing the playing field for cultural heritage institutions as well as for cultural and creative industries. European creators will have new ways to create, promote and disseminate European cultural content and engage widely with new audiences.

The development towards virtualisation of life is not entirely new. For instance, gaming communities exist since many years, where members spend large parts of their lives online, and where virtual economic and social ecosystems can be said to have evolved. However, the scale and breadth of the virtualisation of most aspects of human life that is to come will have cultural impacts many orders of magnitude stronger than has been experienced thus far.

¹¹⁶ In the context of this topic, ‘culture’ should be understood in a holistic sense, along the definition proposed by UNESCO in 2001: “the set of distinctive spiritual, material, intellectual and emotional features of society or a social group, that encompasses, not only art and literature but lifestyles, ways of living together, value systems, traditions and beliefs”

¹¹⁷ In the context of this topic, ‘virtual worlds’ should be understood as persistent, immersive environments, based on technologies including 3D and extended reality, which make it possible to blend physical and digital worlds in real time, in line with the Communication COM(2023) 442 ‘An EU initiative on Web 4.0 and virtual worlds: a head start in the next technological transition’

¹¹⁸ See for instance the above mentioned COM(2023) 442 ‘An EU initiative on Web 4.0 and virtual worlds: a head start in the next technological transition’

It is therefore of great importance to deepen our knowledge and understanding of the long-term effects on culture when people spend ever more time in virtual and blended environments - for work, entertainment, playing, studying, socialising, etc. Research should explore both benefits and risks in depth, based on a thorough understanding of what is realistically possible and probable in a long-term perspective. Key opportunities and threats should be identified in relation to the EU's ambition to strengthen human wellbeing, sense of purpose and agency, as well as social cohesion, resilience and growth.

Based on research findings and scientific knowledge, projects should furthermore develop measures that would help realise the opportunities of cultural evolution in virtual and blended worlds, and mitigate the most important threats. Projects should, to the extent reasonably possible, make sure that findings and proposed measures are valid and feasible across the cultural diversity of Europe.

Proposals are not expected to address all aspects of the virtualisation of life, but should choose a focus that has the potential to bring decisive benefits, and should make sure to analyse these areas with sufficient depth to create a solid knowledge base.

Proposals should, to the extent appropriate, build on existing knowledge, activities and networks, notably the ones funded by the European Union. In particular, projects may want to establish links to the future European Partnership on Virtual Worlds, and may want to build on findings developed by relevant past and/or ongoing Horizon Europe projects¹¹⁹.

INNOVATIVE

HORIZON-CL2-2025-01-HERITAGE-06: Europe as a global powerhouse of design for sustainable competitiveness

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.50 and 4.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 13.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions

¹¹⁹ Such as project 'OPENVERSE': <https://cordis.europa.eu/project/id/101135701>

	under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹²⁰ .
--	---

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Enhanced and updated understanding of the European design ¹²¹ sector and design professionals, including its cross-sectoral relevance for innovation and key strengths, opportunities and challenges, is made available to scientists, policy makers, designers, private companies and other key stakeholders.
- Methods, techniques and applications based on research and knowledge that enable the European design sector and design professionals to stay at the forefront of design for sustainable competitiveness¹²² are developed and put into practice.
- Significant contributions are made to boost Europe as a global powerhouse of design for sustainable competitiveness.

Scope: Innovation and competitiveness are driven to an ever-greater degree by cultural dimensions and creativity. Successful new digital and physical products and services need to be not only functional but also appealing and attractive, adapted to cultural traits and market needs.

The process of creating or adapting products, services, processes or business models to human needs and desires, commonly called design, is key not only for competitiveness but also for environmental sustainability and cultural affirmation. It is widely acknowledged that the environmental impact of a product is largely determined at the design stage. The same also holds for digital products or services.

Building on Europe's world-renowned cultural heritage, well-educated and talented workforce, craftsmanship and strong creative traditions, European design is in many ways considered world leading. Large parts of the European economy rely on top-notch design for competitiveness, such as for instance luxury and high-end goods, fashion or the automotive

¹²⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹²¹ In the context of this topic, 'design' should be understood as the process of devising or adapting products, services or organisational and business models to the needs and desires of humans. As a reference, applicants may also refer to the scope of specialised design activities and professions as identified by Eurostat under the NACE classification Revision 2.1 (Regulation 2023/137)

¹²² Sustainable competitiveness builds on productivity growth, environmental sustainability, macroeconomic stability and fairness. See for instance COM(2023) 168 final 'Long-term competitiveness of the EU: looking beyond 2030'

industry. It is estimated that design-intensive industries employ around 27 million persons in the EU, representing around 13% of total employment and more than 15% of GDP¹²³.

Despite its outsize importance for future prosperity and societal and planetary wellbeing, design and its role in driving innovation and competitiveness have not been sufficiently researched. While being one of Europe's key competitive strengths, the European design sector and design professionals are structurally vulnerable and face a challenging pace of drastic changes. For instance, ever more powerful 'generative artificial intelligence' tools become capable of automating tasks previously requiring high levels of skills, while challenging new expectations in terms of reducing the environmental impact of products and services are added.

The challenge is to deepen evidence-based understanding of the European design sector and design professionals, and devise effective methods to strengthen the sector and make Europe a global powerhouse of design for sustainable competitiveness. Such methods may include new or adapted technological solutions, conceptual frameworks as well as innovative business models¹²⁴ and policies. The proposed solutions should to the extent possible be effective as well as economically and politically feasible and culturally acceptable across the diversity of EU member states and associated countries, as well as across different economic sectors. Thus, a wide range of stakeholders should be involved, in accordance with the focus chosen.

Proposals are not expected to address all aspects, subsectors or applications of design, but should choose a focus that can be expected to deliver a significant impact.

Solutions may involve the use of platforms or networks to facilitate sharing investments, facilities or competencies among actors. In such cases, established platforms, networks or clusters should be taken into account, to avoid duplication of efforts.

Proposals should, to the extent appropriate, build on existing knowledge¹²⁵, activities and networks, notably the ones funded by the European Union. In particular, findings and results from projects funded under the topics 'Cultural and creative industries for a sustainable climate transition' of the 2023 and 2024 calls of Horizon Europe Cluster 2 may be taken into consideration, and cooperation may be sought with the collaborative platform 'EKIP'¹²⁶ or its successor.

HORIZON-CL2-2025-01-HERITAGE-07: Cultural Strategies for Peace: culture and creativity as catalysts for conflict prevention and post-conflict reconciliation

Call: Culture, Creativity and Inclusive Society - 2025

Specific conditions

¹²³ See for instance European Union Intellectual Property Office, Report 'Women in Design' (April 2023).

¹²⁴ Such innovative business models may be based on 'circular economy' principles and design for circularity.

¹²⁵ For instance the work of the Open Method of Coordination (OMC) working group of Member States experts on "Stimulating the green transition of cultural and creative sectors" might be relevant.

¹²⁶ See further <https://cordis.europa.eu/project/id/101112111>

<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 12.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹²⁷.</p>

Expected Outcome: Projects should contribute to all the following expected outcomes:

- Organisations active in diplomacy, culture, research (including SSH disciplines), and education gain insights into the strategic importance of culture, including cultural heritage and the arts, in the contemporary geopolitical context. They understand better how culture can be manipulated, instrumentalised, and even destroyed, to fuel conflict, and how culture, the arts, and tangible and intangible cultural heritage contribute to conflict prevention, reconciliation, preparedness, security and sustainable peace.
- Public authorities, international organisations, NGOs, and society benefit from the empirical knowledge base derived from extensive case study collection, analysis, and evaluation, and from the identification of patterns and best practices, offering adaptable models for integrating culture into sustainable peacebuilding, conflict prevention, preparedness and post-conflict reconciliation.
- Policymakers receive evidence-based recommendations and guidelines for innovative, sustainable peacebuilding strategies working with culture and aligned with EU principles and values.
- Mechanisms fostering ongoing collaboration among researchers, practitioners, and policymakers are established, to ensure sustained progress in culture for security, foreign policy, and sustainable peace, and to support continuous advancement and integration of knowledge beyond the projects' conclusion.

¹²⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: Rapidly evolving geopolitical dynamics place the EU amid escalating conflicts and emergent crises, requiring an innovative approach to security frameworks, foreign policy, and peacebuilding strategies. R&I actions can develop groundbreaking solutions for the future, fostering innovative approaches to security and foreign policy. Integrating culture, including cultural heritage and the arts, into these frameworks could contribute to long term peace and stability by preserving community identity and history, enhancing communities' preparedness to crises, facilitating dialogue, reconstructive learning, reconciliation, and social cohesion. International cultural relations need to adapt to contemporary and future challenges by leveraging innovative strategic approaches to culture to facilitate dialogue, promote mutual understanding, and address socio-cultural disparities fuelling conflicts. The arts and culture offer unique avenues for expression, communication, and trust, transcending socio-political barriers and fostering non-violent strategies for social change, while supporting the preparedness of citizens in case of major disruptions.

Addressing the innovative role of culture in conflict prevention, security, preparedness, resilience, and post conflict reconciliation calls for a fully interdisciplinary approach, drawing from a rich variety of disciplines.

Since 2016, the EU has established a policy framework for international cultural relations heading towards a comprehensive strategy¹²⁸ and initiating pilot projects, preparatory actions, and flagship initiatives alongside numerous ground projects. The European External Action Service Concept and the Council Conclusions on the EU approach to cultural heritage in conflicts and crises (2021) emphasize integrating cultural heritage protection into broader security and peacebuilding frameworks. Proposals should map relevant actions and initiatives led by European institutions, international organisations, individual States, and civil society organisations in Member States and Associated Countries, including those from partnerships in international cultural relations. Analysing these initiatives will build an empirical knowledge base, serving as models and inspiration, and provide insights into different approaches under various circumstances, enhancing understanding of what works best for specific purposes, as well as identifying gaps.

To pursue the expected outcomes, proposals might, by way of example:

- Identify successful approaches to integrating cultural heritage as a strategic asset into foreign policy and security frameworks. Explore the potential of cultural heritage as common ground for conflicting parties, contributing to social fabric reconstruction and long-term stability in conflict-affected regions. Examine intangible cultural heritage and traditional knowledge as sources for peacebuilding strategies, fostering people-to-people connectivity, cooperation, and trust.

¹²⁸ European Commission, High Representative of the Union for Foreign Affairs and Security Policy, Joint Communication to the European Parliament and the Council "Towards an EU strategy for international cultural relations", Brussels, 8.6.2016 JOIN (2016) 29 final; Council conclusions on an EU strategic approach to international cultural relations and a framework for action (2019/C 192/04).

- Explore strategies and approaches at the intersection of art and culture, emergency management, and community resilience, with a view to increase preparedness before, during and after crises.
- Collect and analyse case studies of peacebuilding initiatives involving cultural and creative expressions and the arts, including bottom-up practices.
- Analyse current policies to identify gaps and opportunities for integrating culture and peacebuilding into security and development frameworks. Develop policy guidelines and frameworks to help policymakers incorporate cultural strategies into peacekeeping, security and social development agendas.
- Explore digital technologies for enhancing cultural exchange and dialogue in peacebuilding. Explore the imaginaries, narratives, and metaphors currently prevalent in the AI sector, and consider how the development of AI systems could be enhanced to better support cultural diversity, intercultural understanding, and ‘digital humanism’ to promote peace, safety, and fairness.
- Develop metrics for evaluating the impact of cultural initiatives on peacebuilding, preparedness, and conflict resolution. Conduct empirical studies to measure long-term benefits of these programmes on economic stability, social cohesion, and well-being in conflict-affected areas.
- Investigate how culture can be manipulated, instrumentalised and exploited to provoke conflict, including the tactical use of cultural identity and cultural appropriation to incite tensions. Investigate how cultural heritage of troubled pasts can be approached, providing new insights on how co-existence narratives of the past can contribute to reconciliation, reconstructive learning, and mutual understanding. In this respect, complementarities with topic HORIZON-CL2-2025-01-HERITAGE-08 might be sought.
- Collect and analyse good practices related to leveraging cultural heritage, culture, and creativity to address societal challenges such as fragmentation, polarisation, rising extremism, migration, the refugee crisis, and regional and local tensions.
- Investigate how intersectional factors such as gender, age, citizenship, and socioeconomic status affect participation in and outcomes of cultural peacebuilding initiatives. Assess the differential impacts on various demographic groups and develop strategies for inclusivity. Evaluate the role of cultural institutions and practices in restorative and transformative justice.
- Conduct longitudinal studies to assess long-term effects of cultural interventions on community resilience, social cohesion, and economic recovery in post-conflict regions. Identify key determinants of sustainability of cultural peacebuilding efforts and consolidate understanding of how to sustain peace once achieved.

- Investigate the link between culture, cultural heritage, and sustainable economy, examining their effects on post-conflict recovery, reconstruction and sustainable peace. Conflicts damage local economies, leading to exploitation of natural and cultural heritage for sustenance. These activities, often illegal, may generate quick profits but undermine long-term economic stability.
- Establish sustainable collaboration mechanisms to ensure continuous engagement among key stakeholders, researchers, practitioners, and policymakers, including in diplomacy, promoting robust and long-lasting exchange and cooperation.

International cooperation, as well as synergies with the Jean Monnet project HER-UKR: Challenges and opportunities for EU heritage diplomacy in Ukraine¹²⁹ are encouraged.

The Commission encourages projects funded under this topic to seek complementarities for stronger impact. Proposals should, to the extent appropriate, build on existing knowledge, activities, and networks, notably the ones funded by the European Union, in particular under the Horizon Europe framework programme¹³⁰.

HORIZON-CL2-2025-01-HERITAGE-08: Bridging historical past and future potential through conservation, preservation, and adaptive use of Europe's contentious and dissonant heritage

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.50 and 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.</p>

¹²⁹ <https://www.kuleuven.be/her-ukr>.

¹³⁰ Where applicable, proposals could leverage the data and services available through the research infrastructures included in the European Strategy Forum on Research Infrastructures (ESFRI) and the ESFRI roadmap and those federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹³¹.</p>

Expected Outcome: Projects should contribute to all the following expected outcomes:

- Dialogues between academics, local authorities and communities are strengthened by a Strategic Research and Innovation Agenda identifying trends, drivers, gaps and opportunities and highlight the added value for further research in this area.
- Academic researchers and practitioners (including from SSH disciplines) collaborate to apply tangible research findings in real-world contexts, addressing challenges posed by contested heritage, threatened by neglect, deterioration or abandonment.
- Cultural and Creative Industries (CCIs)¹³² and local authorities have access to innovative solutions to revitalise and reconsider contested cultural heritage to ensure its preservation, conservation, and adaptability for use while engaging future generations in tackling complex historical challenges.
- Policy makers and public authorities are equipped with actionable recommendations to tackle the lack of awareness on contested heritage, with a focus on education and sustainable cultural tourism as key areas for action.

Scope: Europe's rich heritage includes numerous objects, documents in libraries, museums, and archives, but also sites and cultural landscapes that recall complex and often troubled pasts. These heritage assets, often contested and frequently neglected or at risk of deterioration or abandonment, pose significant challenges for preservation, conservation, interpretation, and engagement. Gaining a better understanding of the dissonance and contestation surrounding cultural heritage assets is crucial not only for safeguarding memory and heritage but also for fostering historical understanding, cultural dialogue, and reconciliation on persisting dissonances.

¹³¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹³² CCIs as defined in the European Parliament Resolution 'A coherent EU policy for cultural and creative industries': <https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52016IP0486&from=EN>

Proposals should explore the multiple perspectives on troubled pasts and their impact on cultural heritage, with a focus on heritage assets connected to colonial, totalitarian and authoritarian regimes which may be linked biased or discriminatory beliefs. By engaging with such complex and often painful legacies, proposals should contribute to a broader reflection on participatory approaches in cultural heritage governance. Proposals are also encouraged to adopt a gendered and intersectional approach to advance gender equality and build more inclusive societies. Furthermore, the interplay between culture and nature in managing cultural landscapes is also crucial, requiring a balance between human and environmental values to ensure sustainable preservation.

Proposals should establish a collaborative and multidisciplinary network of professionals. It could rely on expertise from given disciplines and fields, such as: anthropology, history, heritage science (focused on conservation and exhibition and museum curation), media and intercultural communication, political science and science education. Researchers and experts with thematic expertise in the field(s) of memory studies, war and conflict, decolonisation, post-totalitarian regimes, and/or intersectionality could bring an added value. The integration of cultural and creative industries and local authorities could contribute to ensure the real-world applications of this research network.

This collaborative network should develop a comprehensive Strategic Research and Innovation Agenda for the preservation, conservation, transmission, and adaptive reuse of contested and dissonant heritage across Europe. This agenda should identify trends, clear drivers, gaps and opportunities to highlight the added value of complementary research activities or initiatives in this field. The proposed consortium should have an active role in promoting critical dialogues on remaining controversies and their lasting impacts on contemporary societies. Proposals should provide an assessment offering policy recommendations for the documentation, revitalisation (such as better understanding preservation, restoration, transmission, and transformation) and adaptive reuse of dissonant and contested heritage assets to preserve historical and cultural values. The recommendations should support public administrations, particularly local authorities, and the Cultural and Creative Industries in managing contested heritage and engaging with local community.

Proposals should shape recommendations to leverage contested objects, documents, sites and cultural landscapes for educational and cultural tourism purposes, ensuring historical understanding, cultural dialogue, and reconciliation. To address the challenges posed by these heritage assets, proposals should integrate innovative approaches that prioritize sustainability and preservation for future generations.

Proposals could aim to develop educational programmes to target various audiences, including young people, local communities, and international tourists to ensure the engagement of future generations in tackling complex historical challenges. Pilot programmes could be implemented to assess the effectiveness of these tools and recommendations. Public bodies with an interest in supporting the long-term sustainable use of these educational tools could be involved in these efforts.

Recommendations for the integration of contested and dissonant heritage assets into sustainable tourism practices that respect their sensitive nature and contribute to the sustainable development of local communities, is another aspect that should be considered in the strategic agenda. Utilizing existing digital tools and platforms to promote virtual tours, augmented reality experiences, and interactive educational content, making these heritage assets accessible to a broader audience and enhancing visitor experience could be considered as an added value.

While shaping the above-mentioned Strategic Research and Innovation Agenda, the proposal should identify key EU-funded projects contributing to this research area and suggest how to strengthen collaboration and networking in this field. It could also use results from existing evidence-based research, including insights from EU-funded projects. For that purpose, proposals are encouraged to network with and build on previously funded projects under Horizon Europe, in particular HORIZON-CL2-2023-HERITAGE-01-04 Cultural heritage in transformation – facing change with confidence calls, HORIZON-CL2-2024-HERITAGE-01-04 Europe’s cultural heritage and arts – promoting our values at home and abroad, Horizon 2020 or other EU programmes, e.g. Global Europe¹³³ as appropriate. Applicants are also encouraged to consider the services offered by the European Research Infrastructure for Heritage Science¹³⁴.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

International cooperation is encouraged.

HORIZON-CL2-2025-01-HERITAGE-09: Impacts of culture and the arts on health and well-being

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility</i>	The conditions are described in General Annex B. The following

¹³³ https://ec.europa.eu/international-partnerships/global-europe-programming_en

¹³⁴ <https://www.e-rihs.eu/>

<i>conditions</i>	exceptions apply: If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: The granting authority can fund a maximum of one project.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹³⁵ .

Expected Outcome: Projects should contribute to all the following expected outcomes:

- Policy makers at European, national, regional and local level from the health, culture, social care, relief/ humanitarian, youth and education sectors are aware of the impacts of arts and culture on health, well-being and social cohesion and are equipped with policy recommendations and with practical guides on to implement cross-sectorial policies and programmes in this field;
- Stakeholders from the health, culture, social care, relief/ humanitarian, youth and education sectors are aware impacts of arts and culture on health, well-being and social cohesion and are equipped with tools to implement cross-sectorial projects in this field;
- Research gaps in this field are documented and explained, and further the R&I implementation science (including in SSH disciplines) by presenting new scalable and replicable best practices;
- Policy-makers working in international relations/ cooperation are provided with recommendations for promoting EU priorities, culture and fundamental values abroad through the angle of cooperation in the areas of culture, health and well-being.

¹³⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: An Open Method of Coordination expert group is working on culture and health in 2024, building on the preparatory action “Bottom-up Policy Development for Culture & Well-being in the EU¹³⁶” (2022-23)

There has been a major increase of research into the effects of culture and the arts on health and well-being¹³⁷, alongside developments in practice and policy activities in different EU countries. A recent example is the covid-19 pandemic, which challenged individual and collective wellbeing in an unprecedented manner. Its consequences – particularly in terms of mental health – have been felt long after the conclusion of the crisis in medical and public health terms. The covid-19 pandemic has showed that culture may play a profound and fundamental role in our lives. Moreover, the war of aggression against Ukraine has recalled the importance of culture and arts for the mental health of forcibly displaced people.

The Commission Communication “A comprehensive approach to mental health” recognized the contribution of culture to mental health and well-being of individuals and society, for example through culture-based social prescribing and the fight against stigma. The EU Work Plan for Culture 2023-2026 recognises that “cultural activities have a positive impact on people of all ages and backgrounds, enhance people’s quality of life and increase the health and overall well-being of individuals and communities. There is also a significant economic impact.”

The objective of this topic is to reinforce and mainstream the foster cross-sectorial cooperation among cultural, health, social, youth, education and humanitarian/ relief sectors as well as researchers and academia of Member State and Associated countries. The proposals should include cultural and creative sectors at large and consider both the active and the receptive nature of cultural participation; a special attention should be given to analyse situations in which art and culture are disruptive for mental health or are polarizing, thus having an adverse impact.

They should:

1. Create a dedicated platform to enable policy discussions and exchange of knowledge on culture and well-being, as well as further increasing the connection between arts, culture, health, well-being and inclusion of all individuals into the society, particularly among the health and social care sectors.
2. Provide policy guidelines for implementation and evaluate mixed methods, arts and culture- based interventions that address one or more of the following areas (at least one intervention per area):
 - o health promotion;

¹³⁶ [Cultureforhealth.eu](https://cultureforhealth.eu)

¹³⁷ [The societal value of the arts and culture - Publications Office of the EU \(europa.eu\)](#)

- o mental health and well-being (with a focus on children and young people, but also including other population segments, such as working people suffering from burn-out);
 - o the ageing population;
 - o health and well-being of forcibly displaced people; and
 - o links between ill-health and patterns of inequality.
3. Create an evidence gap map of arts and health research and innovation within health promotion, illness prevention, trauma recovery, disease management, and/or disease treatment.

The proposals should collect new practices and policies, evaluate various types of art and culture interventions, in order to better understand their clinical effectiveness and their cost effectiveness. The proposals should develop convincing narratives from the point of view of arts and health economics, health policies and more widely, well-being economics. Well-being is considered here both from an individual and from a societal and community perspective, therefore social cohesion and inclusion should be considered a priority. Moreover, the proposals should allow to map existing research and innovation gaps, identify potential existing barriers and propose a mixed model for cooperation that will take into account participation at the local, national and regional level and the coordination of different sectors and stakeholders.

The proposals should include arts and culture organisations with experience in the area of cross-sectorial collaboration with the other sectors mentioned above.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

Destination Innovative Research on Social and Economic Transformations

Draft expected impacts:

Projects funded under this destination should contribute to the following expected impacts in the Horizon Europe Strategic Plan 2025-2027¹³⁸:

- Strengthening social and economic resilience and sustainability
- Boosting inclusive growth and reducing vulnerabilities effectively

The expected impacts reflect the two-pronged nature of the destination. On the one hand, research funded by this destination will improve the understanding of how the macro drivers of change (technological change, climate change, new global trade patterns, along with migration, human mobility, and other demographic changes) impact society and inform policy makers on how to mitigate negative consequences and harness newly created opportunities. The results obtained should improve the understanding of the interplay between different drivers of change and their social, ethical, political, and economic implications. The improved understanding of these challenges and their economic, social, and distributional impacts will fill in the research gaps while also inform the design and assessment of policies addressing existing and emerging challenges, including in the areas of education, well-being and mental health.

On the other hand, research and innovation investment should be geared towards deepening the understanding of how ongoing changes impact society, with a specific emphasis on the key objectives of boosting inclusive and sustainable growth and effectively reducing vulnerabilities, poverty and inequalities. This knowledge should provide valuable insights to policymakers to design and assess policies that effectively address vulnerabilities while capitalizing on emerging opportunities.

Overall, the destination's activities will help promote the EU's inclusive growth, resilience, and fair transition towards climate neutrality, by providing solid analytical evidence to implementing actions related to:

- The European Pillar of Social Rights, and its Action Plan with its three ambitious targets (78% employment rate, 60% of population with yearly training, and reduction of the number of people at risk of poverty and social exclusion by at least 15 million by 2030)
- the European Education Area and its EU-level 2030 targets
- The Union of Equality policies and strategies, including:
 - o the Strategy for the Rights of Persons with Disabilities 2021-2030, the European Accessibility Act (Directive 2019/882), and the European Disability Card.

¹³⁸ <https://op.europa.eu/en/publication-detail/-/publication/6abcc8e7-e685-11ee-8b2b-01aa75ed71a1/language-en>

- o The Gender Equality Strategy 2020 – 2025 and the Directive combating violence against women and domestic violence
- o EU Anti-racism Action Plan 2020-2025
- o The Strategic EU Framework for Roma Equality, Inclusion and Participation 2020-2030
- o The LGBTIQ Equality Strategy 2020-2025
- o The Strategy on the Rights of Persons with Disabilities 2021-2030
- The Communication on Demographic change in Europe: a toolbox for action
- The EU's just transition policy framework, in line with the 2040 Climate Target Plan, including the Just Transition Mechanism, the Social Climate Fund, and the Council Recommendation on ensuring a fair transition towards climate neutrality.
- The Council Recommendation on strengthening social dialogue in the EU.
- The European Child Guarantee
- The Council Recommendation on adequate minimum income
- EC Communication on a comprehensive approach to mental health
- The New Pact on Asylum and Migration and its accompanying actions, initiatives and legislation.

Applicants are encouraged to consider, where relevant, the services offered by the current and future EU-funded European Research Infrastructures, particularly those in the social sciences and humanities domain¹³⁹.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this research is FAIR (Findable, Accessible, Interoperable and Re-usable).

To maximise the impacts of R&I under this Destination in line with EU priorities, international cooperation is encouraged whenever relevant in the proposed topics.

Research on socio and economic transformations funded by topics in the Work Programmes 2025-27 will build upon its predecessors in Horizon 2020 and Horizon Europe and further push the boundaries of state-of-the-art knowledge. It will do so by further engaging with a vast array of stakeholders. Not only universities and research centers, but also social partners

¹³⁹ <https://ri-portfolio.esfri.eu/>
for example CESSDA - Consortium of European Social Science Data Archives

(trade unions and business organizations), civil society organizations, practitioners, VET providers, and SMEs.

The destination will rely on a carefully balanced mix of actions, to bring together the right mix of actors to achieve the highest quality research, while aiming at providing recommendations to policymakers at European, national, regional and local level that could have a beneficial societal and economic impact. In order to achieve this, it will maximise the feedback to policy and the dissemination and exploitation of research and innovation results and practices in the domain of social and economic transformations.

Proposals are invited against the following topic(s):

HORIZON-CL2-2025-01-TRANSFO-01: Tackling gender-based violence in different social and economic spheres

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁴⁰.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Collect data and analyse the prevalence and impact of gender-based violence (GBV), including tech-facilitated GBV, in different socio-economic contexts and legislative frameworks, and provide policymakers at regional, national and EU level with recommendations to address it.

¹⁴⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Support employers, policymakers, practitioners, and civil society organisations in their work on the prevention, protection, prosecution, and provision of services in addressing GBV, including through promoting best practice sharing, mutual learning and education material focused on consent.

Scope: Gender-based violence (GBV) is a prevalent issue, with 1 in 3 women in the EU having experienced physical and/or sexual violence, 22% of women in the EU having experienced violence by an intimate partner, and 55% having been sexually harassed.¹⁴¹ GBV has destructive consequences for individuals, organisations, the economy, and society as a whole. Gender-based violence is violence directed against a person because of that person's gender or violence that affects persons of a particular gender disproportionately. It can be sexual, physical, verbal, psychological, or economic and occur in different forms, including threats of such acts, coercion or arbitrary deprivation of liberty. However, important knowledge gaps remain on the prevalence and impact of gender-based violence across different social and economic areas. For example, in certain sectors, occupations and work arrangements, like night work, healthcare, hospitality, social services, emergency services, transport and education, workers are more exposed to violence and harassment, although comparable, intersectional data is often still lacking in these fields.¹⁴² While the restrictions imposed during the COVID-19 pandemic led to an increase in domestic violence, still little is known about the impact of the associated rise in teleworking on women's working conditions, including the safety of their working environment. Moreover, in sports, initial studies on sexual GBV showed that a significant percentage of female athletes in Europe are exposed to sexual harassment¹⁴³, but no comprehensive pan-European data is available on this.

Another research field, which requires further attention is the impact of tech-facilitated GBV, including non-consensual sharing of sexually explicit images, manipulated intimate images (e.g., deepfakes and other forms of generative AI), or child sexual abuse online, as well as the potential positive and negative use and effects of AI on GBV.

Therefore, proposals should look at gender-based violence in one or more of the following areas: 1) GBV in the world of work, 2) GBV in sports 3) GBV on online platforms.

Across these areas, proposals should take into account online and offline forms of gender-based violence, and consider intersecting factors, such as age, socio-economic and migrant background, disability, racial or ethnic origin, religion, geography, as well as gender identity and sexual orientation. Proposals should also address the role of bystanders and superiors in addressing gender-based violence and assess the availability and effectiveness of victim support. For data collection, proposals should make use of surveys, as well as administrative data, where available, to assess how public services respond to the needs of GBV survivors

¹⁴¹ European Union Fundamental Rights Agency, Violence against women: an EU-wide survey. Results at a glance, 2014.

¹⁴² Violence and harassment in the world of work: A guide on Convention No. 190 and Recommendation No. 206 International Labour Office – Geneva: ILO, 2021.

¹⁴³ See Recommendations and Action Plan from the High-level group on gender equality in sport: Towards more gender equality in sport. <https://op.europa.eu/en/publication-detail/-/publication/684ab3af-9f57-11ec-83e1-01aa75ed71a1/language-en>

and can foster a safe environment. Where appropriate, proposals should seek the involvement of law enforcement, prosecutors and judges, together with academia/SSH research to optimise input and uptake. For proposals addressing the world of work, the involvement of social partners is encouraged.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

The outcomes of this research will be particularly important in view of recent policy developments, including the EU's accession to the Istanbul Convention, the EU Directive on Combatting Violence against Women and Domestic Violence, Commission Recommendation on integrated child protection to protect children from all forms of violence, as well as the ILO Convention no.190 on eliminating violence and harassment in the World of Work.

Synergies with projects under the DAPHNE strand of the Citizens, Equality, Rights and Values (CERV) programme are encouraged. International cooperation is encouraged, in line with the Gender Equality Strategy for External Action (GAPIII).

HORIZON-CL2-2025-01-TRANSFO-02: Historical and regional analyses of industrial transitions and their lessons for ensuring a fair green transition

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁴⁴.</p>

¹⁴⁴ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link:

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Provide policymakers with an analysis of past and present industrial transformations and what successful policies and measures were used to combat their negative externalities.
- Improve the understanding on the mechanisms of regional responses (e.g. geographic mobility of labour) and provide policymakers with a set of recommendations for seizing the opportunities and smoothing the risks of the developments. Analyse and evaluate forms of collaborative and participatory approaches to the management and governance of transition processes, including through social dialogue and collective bargaining.

Scope: The geographic variation in the impact of the European Green Deal is crucially important. Even though the green transition will have a positive impact and will improve our societies in many respects, regions with sizable employment in coal mining or traditional vehicle manufacturing will be disproportionately impacted. The resulting labour market imbalances can be addressed by people's movements within and between countries and training and skilling policies adapted to regional contexts.

The current economic system favours urbanisation, with jobs and skilled labour now concentrated in large urban areas. However, many jobs needed for the transition towards carbon neutrality are not in the most urbanised regions. Further still, green jobs will not automatically be created in regions with declining industries (such as coal mining, traditional vehicle manufacturing, or maritime transportation ports).

One important field of research should be on mechanisms of geographic mobility of labour (of EU citizens and third country nationals), incorporating a gender perspective to understand how mobility patterns differ and influence workforce dynamics. This is particularly pertinent given the documented impact of gender occupational segregation on labour market outcomes.

Another important research avenue is firm adaptation. Much of the current research is focused on the closing of factories and the subsequent reallocation of labour. However, the great challenge of the green transition is how to prevent existing businesses from closing and to upgrade them in a circular, cost- and resource-efficient manner, and make them more competitive. There is, therefore, a need to study cases of successful transitions that may not involve closing of factories and the policies and practices that enabled them.

Past transitions can provide insight into how to handle economic readjustment in regions strongly impacted by the green transformations. The success of the green and energy transitions hinges on political feasibility. Research is needed to understand what drives feasibility across contexts and how it can be strengthened. Past transitions have forced regions and communities to diversify their economic models. In this regard, they bear many similarities to the green transition.

To ensure Europe will benefit from current transitions, proposals should employ a whole ecosystem approach and draw from a rich variety of (SSH) disciplines including history, sociology, economics, and geography. Proposals may focus on policies which favoured local job creation, upskilling, labour mobility, and business model diversification. Proposals may also focus on the experiences of workers to provide adaptation lessons for the current transitions. Another research perspective could be the role social conflicts and compromises linked with social partners and how these have shaped past transitions. Lastly, proposals may take into account other key megatrends such as labour-saving technological innovation or demographic changes and evaluate how those change in the context of past and current industrial transformations, and how these impact different groups disproportionately.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-TRANSFO-03: Working time reduction: barriers, challenges, benefits and policy implications

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁴⁵ .

¹⁴⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: Projects should contribute to at least three out of the four expected outcomes:

- Deepen the understanding available to policy makers, employers, trade unions and other stakeholders regarding the impacts and implementation of the working time reduction, including its implications on social, economic or environmental outcomes in the society.
- Provide policymakers with recommendations on the feasibility of implementing working time reduction across all types of economic activity and occupations while promoting positive macroeconomic outcomes;
- Provide relevant stakeholders (e.g. social partners, SMEs, large companies and public authorities) with recommendations and data on the enablers and barriers to successful implementation of working time reduction, including at employer and employee level.
- Improved understanding of the potential of working time reduction to increase employment and inclusion in the labour market by activating underrepresented groups, including women, the elderly, workers with disabilities and others.

Scope: Reduction of the working time, understood as a coordinated reduction in weekly working hours concentrated into an extra free day per week without a corresponding decrease in pay, has existed in the economic debate for more than a century, yet much of its potential impact on economic, social, and environmental aspects remains unexplored.

Recently, various initiatives at national, company, and sectoral levels have been launched to test the employment and societal outcomes of these reduced working arrangements. Past experiences generally show some positive evidence on workers' well-being and wages, with marginal impacts on employment levels, but mixed outcomes regarding productivity. Yet, understanding the feasibility of working time reduction across different sectors and occupations is key to assessing its impacts on inequality, societal fairness, and overall economic growth. Moreover, the gender perspective and impacts on workforce inclusion in the working time reduction context is an area that is yet to be thoroughly understood. There is a wide range of environmental outcomes from working time reduction to be also considered, including energy costs and savings, energy poverty, and consumption patterns.

More insights are needed to understand the full battery of enablers, barriers, benefits, challenges, and policy implications arising from implementation of working time reduction, including at organisational level, across a diverse variety of sectors.

While feeding into the expected outcomes, the research project should assess the impacts of working time reduction along at least two out of the three axes: economic, social, and environmental.

These may include but are not limited to the following channels:

- Social impacts on workers, including well-being at the workplace, health outcomes (including stress levels), work-life balance, gendered employment outcomes, labour market inclusion;
- Economic impacts, including effects on productivity, employment, economic growth, hiring and staff retention, absenteeism, firm costs, overall economic demand, innovation;
- Environmental impacts, including on energy expenditures and savings, energy poverty, emission reduction, consumption patterns, sustainable lifestyles.

Applicants are encouraged to employ a variety of SSH research methods, including quantitative micro-economic analysis or behavioural and other experimental research methods.

Proposers may consider the data offered by European Research Infrastructures in the social sciences domain¹⁴⁶.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-02-TRANSFO-04-two-stage: Gender differences in career trajectories of parents and their implications for gender equality and family well-being

Call: Culture, Creativity and Inclusive Society - 2025 - Two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the

¹⁴⁶ ri-portfolio.esfri.eu/ri-portfolio/table/

	Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹⁴⁷ .
--	--

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Policymakers, social partners, and other relevant stakeholders have better understanding of gender differences in career trajectories of parents and their consequences for gender inequalities in the labour market and within households.
- Policymakers, social partners, and other relevant stakeholders have better understanding of links between parental career- and childcare-related decisions, family well-being, and different policy/institutional settings.
- Providing policymakers with effective policy options that help reduce gender gaps in labour market outcomes of parents and support family well-being.

Scope: Gender differences in career trajectories of parents account for large shares of gender employment and pay gaps. This is often referred to as child/motherhood penalties for women (as opposed to child/fatherhood premium for men).

The research proposals should identify key gender differences in careers of parents and assess how they affect at least some of the current gender gaps in socio-economic outcomes such as employment, entrepreneurship, choice of occupation, pay, career opportunities, working conditions, (mental) health, or poverty risks. The research should take an intersectional perspective, considering that career trajectories of women and men also depend on other individual and household characteristics, such as household composition (e.g. single parents), socio-economic status, gender identity (e.g. LGBTIQ parents), migrant background or racial or ethnic origin.

The proposals should assess key positive and negative consequences of different career trajectories of parents for families, taking into consideration the diversity of family arrangements, age and number of children (with emphasis on pre-school ages), quality and stability of family relationships, the availability of economic and social resources, and family well-being.

The proposals should analyse key drivers of parental career and household-related decisions, paying particular attention to the division of unpaid childcare within households, social and cultural norms and stereotypes, work cultures in different economic sectors and occupations, and institutional and policy settings (e.g. childcare, maternity/paternity/parental leaves and other work-life balance policies such as flexible working arrangements or telework).

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data

¹⁴⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

The proposals should:

- Explore the use of longitudinal data from administrative or survey sources on parental careers and/or children's well-being;
- Explore both individual and structural drivers of gender differences in career trajectories of parents through quantitative models;
- Provide in-depth insight into careers of mothers and fathers, and their implications for family well-being, through qualitative research and case studies.

Within the broad scope of SSH research described above, the proposals are encouraged to pay particular attention to:

- Exploring how specific features of early childhood education and care systems (e.g. quality, availability or affordability) affect child participation and family wellbeing;
- Exploring how child/parent friendly workplaces and organisational cultures affect parental careers and family well-being;
- Quantifying economic costs of child/motherhood penalties;
- Reflecting on how child/motherhood penalties affect women from migrant backgrounds, for example in the context of migration flows following the Russia's war of aggression on Ukraine;
- Investigating the impact of heteronormative norms, discrimination, and support systems on LGBTIQ parents' career trajectories and family well-being.

HORIZON-CL2-2025-01-TRANSFO-05: Improving fairness in the economy through a better understanding of undeclared and underdeclared work

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial</i>	The rules are described in General Annex G. The following exceptions

<i>set-up of the Grant Agreements</i>	apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁴⁸ .
---------------------------------------	---

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Policymakers and social partners have insights into the scope and/or characteristics of un(der)declared work or actors involved in un(der)declared work.
- Policymakers receive actionable advice on policy measures effective in reducing the prevalence of un(der)declared work and/or its adverse social consequences.

Scope: Un(der)declared work, as well as the evasion of compulsory payments linked to workers' remuneration (e.g. bogus self-employment to avoid payment to social security schemes) hinder fair social market economy and reduce the sustainability of social protection system.

The proliferation of disruptive technologies, the increased presence of third-country nationals in the Member States, as well as rapidly rising living costs are leading to higher volatility on the labour market, including an accelerated rate of change in the characteristics of labour demand and supply, and new forms of employment such as e.g. project work in the gig-economy. These circumstances are conducive to growing inequality on the labour market and a spread of unfair practices, including un(der)declared work and the evasion of compulsory payments.

The SSH research activities are expected to have a strong multidisciplinary aspect. Proposals should contribute to advancing research on the scope, volume and/or characteristics of un(der)declared work in the economy and/or the evasion of compulsory payments linked to workers' remuneration. Subsequent research activities should contribute to our understanding of the causes and main structural drivers behind actors' willingness to engage in un(der)declared work and/or the related evasion of compulsory payments. Moreover, the research project should contribute to the evidence-based assessment of policies seeking to tackle un(der)declared work and/or the evasion of compulsory payments.

The geographical focus of the research activities should comprise a group of economies with a heterogeneous prevalence of un(der)declared work. The proposals are encouraged to consider the impact of disruptive technologies (e. g. digital platforms, cloud computing,

¹⁴⁸ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

generative artificial intelligence) on the proliferation and/or changing features of un(der)declared work.

The proposal may:

- focus on methods seeking to address social desirability bias in public surveys
- focus on experiments and/or counterfactual analysis to advance the measurement of the impact of policy interventions
- focus on mechanisms of efficient cooperation among national authorities responsible for tackling un(der)declared work
- explore opportunities for the use of machine learning in tackling un(der)declared work
- explore un(der)declared work in the platform economy and/or in new professions created in response to rapid technological change
- focus on un(der)declared work among mobile workers
- insights from behavioural research into drivers behind un(der)declared work and/or the evasion of compulsory payments.
- explore the potential for social-demographic or other typologies of undeclared work
- aim at a establishing a more systematic link between un(der)declared work and taxation system or social security system.
- examine gender and social stratification variations in the nature of un(der)declared work (e.g., occupational segregation, motives, working time patterns).

Clustering and cooperation with other relevant projects are strongly encouraged.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-TRANSFO-06: Evaluation and use of evidence in education policy and practice

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁴⁹.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- New analysis and evaluation of education policy measures.
- Support use of SSH research evidence by education and training policy makers and practitioners.
- Enhanced culture of research and evaluation in education policymaking and among practitioners. Better understanding of the types of expertise and institutional settings that are more effective at informing education policies and practices with evidence.

Scope: The European Education Area¹⁵⁰ aims to improve access to quality education for all. The strategic framework for the European Education Area set the EU-level target: “*The share of low-achieving 15-year-olds in reading, mathematics and science should be less than 15%, by 2030*” (Council of the European Union 2021). The latest data (2022) suggest that the European Union average is much higher¹⁵¹ than 15% and that pupils from low socio-economic status face a considerably higher risk of low achievement than their peers from high socio-economic background. Student performance varies widely, with differences at the student, school and education system levels. Improving educational quality and closing gaps in learning outcomes are important societal issues, and a major challenge for education systems across the European Union. There is a research gap in the empirical evaluation of education policies and practices and the understanding of the circumstances under which they are most beneficial. There is also a gap in the translation of scientific evidence into practices in educational institutions.

¹⁴⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹⁵⁰ <https://education.ec.europa.eu/>

¹⁵¹ Data from the Programme of International Student Assessment (PISA) are used to measure progress towards the EU-level target and the latest data (2022) put the EU average at 26.2% for reading, 29.5% for mathematics and 24.2% for science.

The action must enhance interdisciplinary collaborations among researchers in education and engage diverse educational research disciplines from social sciences, the arts and humanities. The action must include the perspectives of policy makers and practitioners who look at similar topics from different angles. The action should analyse policies in at least one level of education, with a particular focus on transitions from the previous level of education and to the next. Proposals may choose to analyse and evaluate general measures for all learners or targeted and individualised support in inclusive settings. Involvement of authorities responsible for the education and training policies is essential and should be ensured. The action should enhance collaborations to improve the access of researchers to administrative data and other types of data, including surveys of children and young people, to develop new research approaches and perspectives. Therefore, close cooperation with authorities and/or other institutions owning the data is essential and should be ensured.

The action should analyse and evaluate policy measures in their context, using a mixed methods approach including qualitative and quantitative methods. Proposals can include an experimental design, using e.g. small, randomized control trials and quasi-experimental methods (such as difference-in-difference or discontinuity designs) to test the effectiveness of specific interventions in different contexts. Proposals can also include participatory research approaches. Complementarities with the projects funded under the topics HORIZON-CL2-2023-TRANSFORMATIONS-01-05, HORIZON-CL2-2023-TRANSFORMATIONS-01-06; HORIZON-CL2-2024-TRANSFORMATIONS-01-10 and Topic HORIZON-CL5-2023-D1-01-10 are encouraged.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-TRANSFO-07: Impact of the learning environment and the use of digital tools in everyday life on key skills and competence development

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant</i>	The rules are described in General Annex G. The following exceptions apply:

<i>Agreements</i>	Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁵² .
-------------------	---

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Provide analyses of the impact of digital tools in everyday life on wellbeing and how children learn.
- Provide analyses and evidence-based recommendations on how to provide opportunities for high quality education that uses digital technologies in ways that support the wellbeing of the school community (students, teachers and school leaders).

Scope: Digital devices and tools are an integral part in the lives of children and teenagers as they grow. There is discussion about the impact of the use of digital tools in everyday life on children's wellbeing (cognitive, emotional, social) and development, but the evidence is often piecemeal¹⁵³ Proposals should investigate the impact that the expansion and normalisation of children's use of digital technologies (including generative AI) in everyday life has on their learning, at a time in their lives when literacy and numeracy skills are developing, and during adolescence.

Proposals may select different target groups to investigate how intersecting factors influence children's experiences with digital tools, paying a particular attention to age, gender, disabilities, digital exclusion of marginalised groups, and socio-economic status. In this context, proposals should investigate how the school learning environment can support learning and identify effective interventions to support children's social emotional and academic needs. Proposals should focus on primary and/ or secondary general compulsory education, and they could choose to address one or several age groups.

While educational institutions cannot act in isolation, students spend thousands of hours within buildings, and the same holds for teachers and school leaders. Sustainable Development Goal (4.a.) emphasises the importance of physical learning environment in

¹⁵² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹⁵³ For example, mobile phones or smartphones could have a potentially unprecedented impact on children's development, as the frequency of engagement is likely to be high. Possible impacts include for example cognitive overload, increased distraction, altering memory and learning patterns, impact on sleep duration and sleep quality, on wellbeing among adolescent girls and boys, on wider social activities, such as sport or cultural activities, or on leisure. There are also concerns that excessive screen time can impact children's social and emotional development, leading to debates about the quality of their interactions. Recent findings from the PISA survey highlight a negative correlation between leisurely digital device use at school and academic performance.

education facilities. Proposals could investigate the impact of learning environments on education outcomes and how its design responds to changes in teaching and learning.

Proposals should propose methods that address the complex nature of the topic under study, the existing data and the rapid changes in the technological landscape. Proposals are encouraged to use mixed methods approaches, and deepen inter- and transdisciplinary research in education (including from SSH disciplines), involving multiple perspectives, with the aim to improve learning and educational settings. Proposals can choose on which aspect of student well-being (cognitive, emotional, social) and skill development they focus. Proposals should include the voice of children and young people through active and meaningful participation and other relevant stakeholders as part of the data collection.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-TRANSFO-08: Improving mental health outcomes for people in education, training and work

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 15.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁵⁴.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

¹⁵⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Deliver scalable and replicable integrated person-centred interventions on mental health included blended ones, in a manner that they are transferable to the new contexts in education, training and work, and studying and comparing their impacts;
- Deliver integrated person-centred interventions to all segments of population and age groups, with a particular focus for the youth with mental health conditions to improve their education, training and work trajectories, in order to ensure all these people's inclusion into society;
- Provide relevant authorities, policy makers, key stakeholders and practitioners with viable tools to make evidence-based informed decisions for implementation to benefit mental health outcomes in education, training and work. This includes effectiveness studies as well as the delivery of data, including health economics data of the developed intervention(s) to further advance this policy area; and
- Provide quality evidence-based data to policy makers and research and innovation stakeholders to bridge the gap between mental health outcomes and related socio-economic transition.

Scope: In Europe, 84 million citizens ranging from the youth to ageing population of all socio-economic backgrounds of all genders, including vulnerable groups are suffering from various mental health issues in their everyday lives at home, at work, at school as well as in the virtual cyber-world. The mental health issues affect people in different ways and/or period(s) of their life course as well as the people who live, work and/or study in vicinity of these persons with mental health issues, and/or people who belong to their family, friends and/or social circuits.

The foundation of mental health is mostly laid in adolescence: half of all mental health conditions start by 14 years of age and most cases go undetected and untreated. The staggering figures show that the second leading cause for death of young people of 15-19 years is suicide after the road accidents.

Addressing and treating mental health conditions is therefore essential to improve the downstream impacts on education, training and work and future socio-economic outcomes. It also represents a long-term investment in public health.

Over the past years, many innovative solutions (supported EU Framework Programmes for research and Innovation and/or international, national, regional, and local initiatives) for tackling mental health problems have been developed. However, few interventions have been implemented at scale. There lacks evidence about the feasibility, acceptability and suitability of these mental health interventions at scale.

Building on innovative solutions supported by EU Framework Programmes for Research and Innovation and/or international, national, regional, and local initiatives, the challenges of the topic are:

- to significantly increase / scale-up the percentage of interventions that are actually used, and
- to involve families, individuals/communities, stakeholders and authorities, such as public services, civil society organisations in the development and implementation of interventions aimed at heterogeneous segments of population

Additional evidence is also needed about to which extent mental health interventions are actually cost-effective and cost-efficient – looking via various policy perspectives, e.g. education, training, working life, well-being and health. This would aid policy makers to decide on which one (or a combination) of the policy choices to use when weighing up policy choices in investment for education, training and work- related outcomes.

To ensure replicability, projects are required to specify clearly how they target primary prevention (benefitting an entire target group), and/ or secondary prevention (provided for vulnerable groups and individuals with existing mental health problems). The project design and implementation should clearly outline and justify who they are targeting with what types of interventions and in what type(s) of contexts.

Special attention should be paid to the visibility and communication of the research and innovation findings to direct beneficiaries of the intervention and their families, communities, wider publics and stakeholders from the start of the work.

Clustering and cooperation with other selected projects under this call and other relevant projects is strongly encouraged. Considering the complex design and implementation of these projects, it is expected that projects may take 4 years or more to deliver solid evidence for take-up by policy makers, practitioners and stakeholders, which also justifies an appropriate budget per project.

Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-TRANSFO-09: Good practices for increased autonomy of persons with disabilities, including physical, mental, intellectual and sensory disabilities

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.40 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.

<i>Type of Action</i>	Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁵⁵.</p>

Expected Outcome: Projects should contribute to some of the following expected outcomes (minimum three outcomes):

- Develop innovative evidence-based policy approaches to promote the autonomy of persons with disabilities of any age and any origin of the disability or impairment.
- Develop practices that facilitate the full inclusion and participation of persons with disabilities in different areas of life, including education, family life, employment, living arrangements, leisure, arts, culture and sport on equal basis with others.
- Address the seamless use of accessible and assistive technology, including digital technologies and artificial intelligence, in the community and related services and infrastructure. If possible, identify specific measures and tools for different addressed areas of lives of persons with disabilities, such as education, recruitment, hiring, return to work, and independent life.
- Identify and compare the usefulness of different options for policies and measures aiming to increase the autonomy and quality of life of persons with disabilities, as well as the quality of life and well-being of their families, using a person-centred approach, taking into account the individual needs of persons with disabilities and ensuring their full enjoyment of human rights and fundamental freedoms on equal basis with others.
- Identify relevant actors to achieve effective results (public actors, civil society organizations, private sector, social economy actors, etc.) and explore their roles and interaction, with a view to assessing integration among different social, support and essential services (including e.g. transport or housing) necessary to promote autonomy and inclusion in the community.

¹⁵⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: The UN Convention on the Rights of Persons with Disabilities¹⁵⁶ recognises the right to individual autonomy and independence for persons with disabilities, including the freedom to make their own choices. Ensuring this right requires a differentiated landscape of measures in all areas of society, including ensuring accessibility and quality person-centred support services.

Having affordable and community-based services and measures in place, which meet the individual needs of persons with disabilities, is a basic pre-condition for autonomy and independence. Social and support services and measures need to be inclusive and accessible for persons with disabilities of any age and with any disability. The proposals may focus on a specific disability or address several of them. Research (including from SSH disciplines) should address barriers and solutions with regard to specific disabilities to increase inclusiveness, decision-making and autonomy, taking into account the integrated and person-centred support provided by families. The role of the family as carers and as the first agent to promote inclusion needs to be addressed. Different solutions for accessible and inclusive housing could also be explored.

A key aspect of the autonomy and independence of persons with disabilities is the access to inclusive education, training, active labour market measures and employment in the open labour market. Promising support practices in these areas should be mapped, analysed and tested, including the integration and communication between different services for a user-centred approach.

European Education Area initiatives such as the Council Recommendation on Pathways to School Success¹⁵⁷ aim to address equity and inclusion in education. A wide range of actions and peer learning activities aimed at supporting inclusive education are also implemented, in particular through two European Education Area strategic framework Working Groups¹⁵⁸: Working Group on Equality and Values in Education and Training and Working Group on Schools – Pathways to School Success.

The proposals should consider the impact – including the impact on the self-esteem of persons with disabilities – of inclusive education versus special needs education or special schools/classes for promoting the autonomy of persons with disabilities. The proposals may also consider the role of special training and lifelong learning adapted to persons with physical, mental, intellectual or sensory disabilities.

New and innovative ways of increasing the autonomy of persons with disabilities need to be explored and tested with the objective to reduce inequalities, promote their full inclusion in society in different areas of life, including education, family life, employment, living arrangements, leisure, arts, culture and sport, and improve their quality of life, as well as the

¹⁵⁶ Article 1 of the Un Convention on the Rights of Persons with disabilities: *Persons with disabilities include those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others.* <https://www.ohchr.org/en/instruments-mechanisms/instruments/convention-rights-persons-disabilities>

¹⁵⁷ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32022H1209%2801%29>

¹⁵⁸ <https://education.ec.europa.eu/about-eea/working-groups>

quality of life and well-being of their families. This includes the use of assistive technology and other accessible digital technologies and artificial intelligence (AI) measures and tools to increase accessibility in society and overall communication, social participation and inclusion of persons with disabilities.

The possible loneliness, impact on emotional well-being and inactivity status of many persons with disabilities needs to be addressed when designing approaches to increase their autonomy and independence. Moreover, the higher risk of persons with disabilities to be exposed to abuse, neglect (including self-neglect), scams and aggression needs to be considered, including when disability is combined (from an intersectional perspective) with other conditions which may be a source of vulnerability (e.g. age, gender, migrant status, discrimination based on racial or ethnic origin). Loneliness and other mental health issues (e.g. burnout) suffered by family carers or other informal carers may be also considered.

Proposals should include civil society engagement and dialogue, for wider input and uptake. Proposals are encouraged to seek synergies and collaboration whenever possible with projects funded under the topic HORIZON-HLTH-2025-01-STAYHLTH-01: Improving the quality of life of persons with intellectual disabilities and their families. Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

HORIZON-CL2-2025-01-TRANSFO-10: Intergenerational fairness in the context of demographic change in the EU

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.20 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.
<i>Legal and financial set-up of the Grant</i>	The rules are described in General Annex G. The following exceptions apply:

<i>Agreements</i>	Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁵⁹ .
-------------------	---

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Enhance the understanding and engagement on intergenerational fairness among policy makers, researchers and citizens on future trends and drivers of intergenerational fairness in the EU through quantitative and qualitative analyses;
- Provide policy makers with scientific knowledge (including knowledge generated through SSH) and data for evidence-informed policies to address the drivers of intergenerational inequalities, tailoring interventions to diverse demographic groups, ensuring inclusivity across gender, ethnicity, and socioeconomic status;
- Develop an action plan to inform policy making, including a set of viable policies to adapt the European economic and social model to reduce intergenerational imbalances and help prevent them in the future, taking into account cross-policy synergies in terms of factors influencing intergenerational fairness.

Scope: Demographic trends over the last decade and future projections show that the share of the population aged 65+ is growing, both in comparison to the working-age population and to the child population. This is due to an increasing life expectancy and lower fertility and poses major challenges for intergenerational fairness and affects the implicit social contract across generations.

There is a growing need to provide an adequate framework for addressing fairness across generations (including knowledge on past generations, current and in particular future ones) related to education and labour market opportunities and outcomes, wealth accumulation and distribution of economic gains and costs, housing affordability, well-being and health, including environmental impact, role of institutions and public services, in the face of new challenges, such as ever-faster technological and climate change and changing public preferences.

- Proposals should provide in-depth analysis of at least 3 different drivers of intergenerational inequalities such as, but not exclusively, from the ones listed above, and the interdependence between them.

¹⁵⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Proposals should investigate intergenerational fairness, solidarity and trust through an intersectional lens, considering gender, family structure, racial or ethnic origin, socioeconomic and migration backgrounds.
- Proposals may have a regional and/or national dimension.
- Proposals may focus on developing and/or forecasting intergenerational fairness indicators.
- Proposals may draw lessons from recent policy interventions in EU Member States in a contextual and transdisciplinary manner and propose adjustment measures or test them through social innovation experiments.
- Proposals may focus on democratic participation and socially inclusive pathways to co-creating public values for current and future generations.

Clustering and cooperation with other selected projects under this call and other relevant projects is strongly encouraged.

Applicants are encouraged to consider the data offered by European Research Infrastructures in the social sciences domain, particularly SHARE (ri-portfolio.esfri.eu/ri-portfolio/table/). Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

Proposals should consider the involvement of the European Commission's Joint Research Centre (JRC) based on its experience and with respect to the value it could bring in providing an effective interface between research activities and policymaking.

HORIZON-CL2-2025-01-TRANSFO-11: Migration and climate change: building resilience and enhancing sustainability

Call: Culture, Creativity and Inclusive Society - 2025	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply:

	<p>If eligible for funding, legal entities established in non-associated third countries may exceptionally participate in this Coordination and support action as a beneficiary or affiliated entity.</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁶⁰.</p>

Expected Outcome: Projects should contribute to all of the following expected outcomes:

- Strengthen EU and national migration governance by developing a dynamic knowledge database and an exchange platform, for enhanced collaboration among researchers, policymakers, and practitioners, promoting the integration of environment and climate change migration considerations into EU and national policies.
- Develop a strategic roadmap that outlines key research (including in SSH disciplines) and policy priorities addressing climate change and migration and supports implementation measures.
- Develop policy recommendations to improve the EU's understanding and preparedness, and to enhance collaboration between the EU and third countries within the frameworks of relevant EU policies.

Scope: Proposals should develop a strategic roadmap that will act as a comprehensive framework for understanding the impacts of climate change on migration and its impact on future generations and outline key research and policy priorities in the context of environmental degradation, climate change and migration.

Having developed such a roadmap, proposals should develop a dynamic exchange platform with up-to-date information, to be accessed by all concerned parties, involved in climate change and migration including EU and national authorities, researchers, policymakers, and

¹⁶⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

relevant stakeholders. This platform should be collaborative, user-editable, and community-driven, allowing for future updates and contributions from various stakeholders. It should act as comprehensive go-to place, a source repository, and a networking and coordination space, with a focus on integrating climate change considerations into migration policies. The platform should incorporate comprehensive data on migration patterns, including on international and internal displacements, on international destinations including neighbouring EU countries, and EU arrivals, and on climate change as a root cause or its interaction with other root causes, with the goal to inform policy decisions.

Proposals should identify gaps and set the groundwork for future research and policy initiatives. They should adopt an interdisciplinary approach integrating climate, population, and human mobility studies addressing the complex relationship between environmental disasters and migration intentions. They should encompass a broader analysis of vulnerabilities, such as internal displacements, how preexisting inequalities (e.g. social, economic, political, health, gender) are exacerbated due to climate change, and populations stranded in their countries of origin, aligning with EU's external policy frameworks for adaptation strategies¹⁶¹.

Proposals should consider the involvement of the Knowledge Centre on Migration and Demography (KCMD) operated by the European Commission's JRC¹⁶² with a view to be sustainable beyond the lifetime of the project. In particular:

- the structure and the format of the platform should be decided together with DG RTD, DG HOME and the JRC, and it should be built and hosted within the web environment of the Knowledge Centre on Migration and Demography as part of its knowledge management efforts;
- the development of the roadmap is encouraged to be developed in consultation with relevant stakeholders, particularly including with DG RTD, DG HOME and the JRC;
- findings and recommendations should be translated in very concise policy briefs, preferably in coordination with the KCMD.

Proposals could identify local case studies to perform context-specific analysis and extract actionable insights and scalable solutions that could inform broader migration and climate adaptation policies. These local case studies could explore the impact of climate change in different regions and the phenomenon of environmental immobility, where individuals are unable or unwilling to move despite facing significant environmental threats.

The proposals are strongly encouraged to look into the findings of completed Horizon 2020 projects on forecast and foresight, particularly from the topic 'MIGRATION-01-2019 - Understanding migration mobility patterns: elaborating mid and long-term migration scenarios', and wherever possible build on their outcomes and methodology¹⁶³. They are also

¹⁶¹ https://climate.ec.europa.eu/eu-action/adaptation-climate-change/eu-adaptation-strategy_en

¹⁶² https://knowledge4policy.ec.europa.eu/migration-demography_en

¹⁶³ https://cordis.europa.eu/programme/id/H2020_MIGRATION-01-2019/en

encouraged to build on the deliverables of project INNOVATE¹⁶⁴ and of relevant projects of Destination “Effective management of EU external borders” of Horizon Europe Cluster’s 3/Horizon 2020’ SC7, such as projects ITFLOWS¹⁶⁵, CRITERIA¹⁶⁶, MIRROR¹⁶⁷ and PERCEPTIONS¹⁶⁸, as well as the relevant use cases and pilots conducted as part of the Destination Earth initiative¹⁶⁹.

Proposals should consider incorporating in the platform the data provided by European Research Infrastructures, such as the European Social Survey¹⁷⁰ or other Research Infrastructures dealing with climate change and environment. Where applicable, proposals should leverage the data and services available through European Research Infrastructures federated under the European Open Science Cloud, as well as data from relevant Data Spaces. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable).

The selected project should produce a range of feasible policy recommendations. These recommendations should be based on evaluations of existing EU humanitarian aid, development and migration policies and drafted as policy options that are directly actionable, include cost considerations and explicitly recommend additions or modifications of current EU strategies, regulations, and directives. The option of non-action should also be elaborated. The recommendations should be firmly embedded in EU values such as respect for human dignity, gender and age equality, and fundamental rights.

OTHER ACTIONS not subject to calls for proposals

Public procurements

1. Studies, conferences, events and outreach activities

A number of specific contracts will be signed under existing framework contracts in order to: (i) support the dissemination and exploitation of project results; (ii) contribute to the definition of future challenge priorities; (iii) undertake citizen surveys such as Eurobarometers, (iv) carry out specific evaluations of programme parts; and (v) organise conferences, events and outreach activities. Should existing framework contracts prove unsuitable or insufficient to support the abovementioned activities, one or more calls for tender may be launched as appropriate.

Subject matter of the contracts envisaged: studies, technical assistance, conferences, events and outreach activities within the scope of Cluster 2 ‘Culture, Creativity and Inclusive Society’.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: 2025

Indicative budget: EUR 1.00 million from the 2025 budget

Other budget implementation instruments

1. Mobilisation of research funds in case of Emergencies 2025

This action will only be used in case of exceptional and duly substantiated emergencies as described in the scope section of the action.

Expected Impact: Proposals should set out a credible pathway to contributing to one or several expected impacts of the 3 destinations of Cluster 2 ‘Culture, Creativity and Inclusive Society’.

Expected Outcome: Projects should contribute to at least one of the following expected outcomes: Allow the Union to respond to emergencies in the field of:

- Democracy and governance, especially in the field of the rule of law, extremism, racism and/or foreign interference to democratic processes of the EU, its Member States, EU Neighbourhood and Candidate countries;
- Cultural heritage, cultural and creative sectors and industries, especially the protection of cultural heritage, provenance research and fight of illicit trafficking of cultural goods;

- Social and economic transformations, especially economic and financial shocks and unprecedented pressures on global supply chains, labour markets and social protection systems;
- Migration, refugee and asylum policies, especially unforeseen humanitarian crises caused by sudden migration and refugee flows and displacement of civil population.

Scope: Future emergencies, such as potential new, unexpected consequences of the unprovoked military aggression and invasion of Ukraine by Russia¹⁷¹, , consequences of other conflicts in Europe and its vicinity, or major events with societal impact (including, but not limited to, public health and climate-related ones), require the urgent mobilisation of Cluster 2 Research and Innovation stakeholders in order to assist European policy and decision-making with evidence, analysis and policy options, therefore funding will be mobilised for:

- The award of grants without a call for proposals according to Article 198 (b) of the EU Financial Regulation¹⁷² in exceptional and duly substantiated emergencies. At that time, the Funding & Tenders Portal will open a dedicated section where proposals can be submitted. This will be communicated to the National Contact Points. The invitation to apply for funding will be open to all eligible entities or be limited to targeted entities, taking into account the need to achieve the underlying objectives in a quick and efficient manner considering the exceptional circumstances.

Specific conditions:

- In order to ensure a balanced portfolio covering, grants will be awarded to applications not only in order of ranking, but also to those projects that enhance the quality of the project portfolio through synergies between projects and avoidance of overlaps, provided that the applications attain all thresholds.
- The action may also include justified derogations from the standard limits to financial support to third parties. Where applicable, the relevant grant agreement options will be applied.

Form of Funding: Grants not subject to calls for proposals

Type of Action: Grant awarded without call for proposals according to Financial Regulation Article 198 (b)

The general conditions, including admissibility conditions, eligibility conditions, award criteria, evaluation and award procedure, legal and financial set-up for grants, financial and operational capacity and exclusion, and procedure are provided in parts A to G of the General Annexes.

¹⁷¹ Condemned on a global scale by the overwhelming majority of United Nations Member States in the Resolution of the UN General Assembly of 2 March 2022 (UN GA Resolution ES 11/1) and addressed by European Commission Communications COM(2022) 107 final and COM(2022) 131 final.

¹⁷² Article 198(b) of the Financial Regulation "Grants may be awarded without a call for proposals only in the following cases: [...] (b) in other exceptional and duly substantiated emergencies;".

Indicative timetable: Will depend on the emergency

Indicative budget: EUR 3.00 million from the 2025 budget

Indirectly managed actions

1. Observatory of Public Sector Innovation (OPSI) Phase 4

Expected Outcome: the project is expected to contribute to all of the following expected outcomes:

- Creation of new knowledge and expanding the horizon for public sector innovation: The project will significantly expand the frontier of public sector innovation knowledge with first-hand, in-depth research on emerging innovative approaches to tackle public challenges (from twin transitions to leveraging AI for public good) and will support governments with the application of that knowledge in internal government policy, service processes and practices.
- From theory to practice: The project will support governments in the creation of organizational frameworks, ways of working, rules, processes, coordination, and capabilities conducive to sustaining innovation within government administrations; preparation for anticipatory governance and adaptation to emerging challenges through innovative internal working methods, action research, and capability-building.
- Fostering multi-party collaboration and strengthening the network: The project will foster multi-party collaborative projects among networks of governments to build new knowledge, share good practices and jointly develop practical guidance for public sector innovation. OPSI will convene and facilitate high-level strategic reflections and extend existing networks by intensifying collaborations via common shared research and online tools, deepening the reach of innovation into core professional communities (such as policymakers and regulators, analysts, auditors, budget officials, etc) within national government administrations. The project will further expand and connect the public sector innovation community inside governments at EU, national, and sub-national levels.
- Taking stock of national governments' internal innovation efforts: The project will help expand the understanding of how national governments in the EU and Horizon Europe Associated Countries promote and facilitate innovation in their government through e.g. more granular mapping, policy-relevant and easy-accessible comparative data. This support will be aimed at producing a comparative outlook on public sector innovation in the EU and Horizon Europe Associated Countries as regards their internal innovation efforts, new governance practices, working methodologies, innovative policymaking practices (e.g. through experimentation, systems approaches, etc.). By engaging with the broader innovation system, governments will become better equipped to develop effective public policies, responsive public services, and co-create solutions to pressing societal challenges.

Scope: In this new era of rapidly emerging disruptive technologies, climate change, and mounting geopolitical, economic and societal pressures, governments are facing multiple, simultaneous challenges, and changes at national and global level. Governments must evolve to meet these multifaceted challenges, fostering resilience and adaptability through internal innovation efforts and positively impactful public sector reforms. This evolution will reshape administrative structures, redefine collaboration with other ecosystem players, and transform resource management and operational strategies—and it needs to be done while building trust and democratic legitimacy with constituents. It is essential to provide a framework for governments to exchange experiences, learn from one another and to be supported in their efforts of bringing innovative practices into the daily operations of their public administrations.

Activities that need to be conducted to attain the above expected outcomes are the following:

- Systematically identify and map potential enablers of innovation in public administrations through mechanisms like e.g. procurement, budgeting, and human resources management as points for innovation in public administration. Provide enriched sets of data on major trends and enablers with a view of distilling policy-oriented guidance. Explore how innovation can drive public trust in government, linking innovation with core public functions and leveraging insights from behavioural science.
- Define and support the next generation of public sector innovation labs, handle complexity and change, provide purpose-driven approaches to citizens'/societal challenges, and host exploratory and experimental methods and practices in public administrations. Gather up-to-date relevant data to go beyond normative approaches to innovation labs, drawing on experiences, challenges and opportunities for innovation labs at the global level. Design guidelines and instruments to support innovation labs to create value for people and lever innovation in Government. Test and compare models for delivering innovation across different governance contexts and at different scales. Specify frameworks and instruments to provide actionable and re-usable guidance to steer and support the embeddedness and sustainability of innovation labs in the public sector, as well as secure and improve high-level commitment and sponsorship.
- Revisit the core skills for public sector innovation and identify the factors that transform public administrations from talk into action. Evaluate and enhance modalities for capacity building in innovation, focusing on structures and practices that foster an authorizing environment for innovation, especially at senior management levels. Share learnings through structure knowledge-enhancing programs for civil servants, policymakers, public managers, and senior leaders.
- Broad-based and practical anticipatory innovation governance through actioning existing principles and developing new tools, such as those aimed at anticipatory intelligence collection and sharing, regular outlooks on the future of government, as well as case research on emerging trends and behavioural science, to help governments anticipate and navigate future changes.

- Strengthen multi-party projects via online platforms, extending its reach within national government administrations, and expanding the public sector innovation community at all levels. Disseminate the vast collection of practical knowledge through new channels and in new formats, leveraging behavioural science to reach audiences that are not already “innovation enthusiasts.”
- Design and support purpose-driven approaches for governments to address societal challenges, such as social inclusion. Strengthen existing methods and tools for the engagement of stakeholders from the broader innovation ecosystem for co-creation, co-delivery, and co-assessment of innovative policies and initiatives. Test challenge-based approaches for ecosystem engagement in order to demonstrate their potential benefits (and challenges) for public sector innovation, and share the lessons learned and related methodological resources.

The Observatory of Public Sector Innovation (OPSI) was established and managed by the OECD, co-funded by the Horizon Europe Programme (and other OECD countries) since 2015. Based on the results of the work and on the collaborations developed with the network of OPSI national contact points, the Observatory offers leading edge action research, related infrastructure and valuable support to governments investing in the development of internal innovation capabilities, strategies and practices within their government administrations. The OPSI shares a wealth of new knowledge and experience with OECD governments, including 24 EU Member States signatory to the OECD Declaration on Public Sector Innovation (2019). There is no other actor with the necessary infrastructure, state-of-the-art analytical capacity and data in international comparison, political processes and networks in place, and with access to this large constituent of governments of the world's leading economies that could do the work of this scale and scope. This action would enable the OECD OPSI to intensify, deepen and widen its work with governments in support of their internal innovation efforts.

Horizon Europe
Work Programme 2025

6. Civil Security for Society

IMPORTANT NOTICE:

This draft has not been adopted or endorsed by the European Commission. Any views expressed are the views of the Commission services and may not in any circumstances be regarded as stating an official position of the Commission.

This draft is made public before the adoption of the work programme to provide potential participants with the currently expected main lines of this work programme. Only the adopted work programme will have legal value.

The adoption of the work programme will be announced on the Horizon Europe website and on the Funding and Tenders Portal.

Information and topic descriptions indicated in this draft may not appear in the final work programme; and likewise, new elements may be introduced at a later stage. Any information disclosed by any other party shall not be construed as having been endorsed by or affiliated to the Commission.

The Commission expressly disclaims liability for any future changes of the content of this document.

3. Indirectly Managed Action by the ECCC	90
APPENDIX – Indirectly managed action by the ECCC	91
Budget	108

Introduction

Cluster 3 provides a research and innovation response to a context of rapidly changing threats and challenges to internal security, the security of citizens, critical infrastructure and the security of society as a whole. These threats are driven by geopolitical, technological and societal changes, including:

- Instability, hybrid threats and the resurgence of war on the European continent, in particular the Russian war against Ukraine, making the need for civilian protection, preparedness, and resilience a matter of urgency.
- Continued threat from terrorism and increased threat from organised crime.
- The potential for large-scale movements of people, whether due to war, the instrumentalisation of migration, or other drivers, requires effective border management capabilities and further efforts to combat migrant smuggling, trafficking in Human Beings (THB), and possible terrorist infiltration.
- More frequent and serious climate-related extreme events and other disasters, whether accidental or intentional, of human or natural origin, requiring disaster risk management and response.
- Continued technological development and digitalisation create new and unforeseen vulnerabilities and new opportunities for criminals and violent extremists, as well as new challenges, needs and opportunities for security practitioners.
- Cyber threats that put infrastructures, businesses and individuals at risk.
- Negative socio-economic trends and climate adaptation that create potential for greater social polarisation and mistrust, which may escalate into conflict and/or create opportunities for extremists and malicious actors to spread hate speech and disinformation.

In addressing these and their related challenges, this Work Programme will support the implementation of the upcoming EU's Internal Security Strategy and Preparedness Union Strategy, and the sectoral strategies, legislation and action plans identified in the introduction to each of the **Destinations**:

- **Better protect the EU and its citizens against Crime and Terrorism (FCT)**

Link to the Horizon Europe strategic plan 2025-2027: Expected impact 13 “Tackling crime and terrorism more effectively and increasing the resilience of infrastructures”.

- **Effective management of EU external borders (BM)**

Link to the Horizon Europe strategic plan 2025-2027: Expected impact 12 “Facilitating legitimate movement of passengers and goods into the EU, while preventing illicit acts”.

- **Resilient infrastructure (INFRA)**

Link to the Horizon Europe strategic plan 2025-2027: Expected impact 13 “Tackling crime and terrorism more effectively and increasing the resilience of infrastructures”.

- **Disaster-Resilient Society for Europe (DRS)**

Link to the Horizon Europe strategic plan 2025-2027: Expected impact 11. “Reducing losses from natural, accidental and human-made disasters”.

- **Strengthened Security Research and Innovation (SSRI)**

Link to the Horizon Europe strategic plan 2025-2027: Cross-cutting Destination that supports all the Expected impacts identified above.

Each Destination includes an introductory section that explains the relevant policy objectives, specifies elements to be taken into account for the topics of the Destination, and identifies specific expected impacts. Proposals should set out a credible pathway to contribute to the specific expected impacts.

In addition, under this Work Programme, the Commission intends to entrust implementation of a call for proposals to the European Competence Centre for Cybersecurity (ECCC). The call topics foreseen for this indirectly managed action (see Appendix to this Work Programme part) relate to:

- **Increased Cybersecurity (CS)** *Link to the Horizon Europe strategic plan 2025-2027: Expected impact 14 “Increasing cybersecurity and making the online environment more secure”.*

Cluster 3 Work Programmes will support the implementation of the European Commission political guidelines 2024-2029 for a ‘Safer and more secure Europe’, a ‘Preparedness Union’, with ‘Stronger Common Borders’, protecting democracy and putting research and innovation at the heart of a resilient economy. Overall, research under this Cluster should continue to focus on preserving and securing **citizens’ basic right to feel safe**. Cluster 3 ‘civil security for society’ will therefore also support the Commission’s work:

- towards a new European Internal Security Strategy, fighting organised crime and ensuring that security is integrated in EU legislation and policies by-design.
- to provide law enforcement with adequate and up-to-date tools for lawful access to digital information, while safeguarding fundamental rights and strong cybersecurity.
- to make better use of public procurement, particularly to support innovation procurement.

Successful projects need to show their understanding of and contribution to a wider innovation cycle based on a needs-driven capability development approach that triggers research, steers its implementation and capitalises on its outcomes. This means that projects

need to show, on the one hand, an understanding of the capability requirement and policy context that has led to the R&I need, and, on the other hand, a strategy for ensuring the uptake of the outcomes including opportunities where relevant for using EU funds for deployment.

Cross-cutting themes

Various themes run through this Work Programme, cutting across the different sectoral Destinations. A first set of themes respond to the wider challenges identified in the three key strategic orientations of the Horizon Europe strategic plan 2025-2027:

- *Strengthening resilient societies and democracy.* The central focus of Cluster 3 is supporting the prevention, preparedness and response to the wide range of threats to internal security identified above, as well as ensuring the security of citizens, critical infrastructure and of society as a whole¹. Strengthening our democracies and making them more resilient – both materially and psychologically – has taken on a new urgency since the Russian full-scale invasion of Ukraine. European citizens need to be protected from hybrid threats such as disinformation campaigns or fake news while upholding the rule of law and basic freedoms, including freedom of speech. Civil security research and innovation needs to equip civil security practitioners with the ability to mitigate the consequences of armed conflict, in particular attacks on critical infrastructures. By funding research to strengthen and prepare our societies, democracies, and infrastructure against hybrid threats, Cluster 3 shows its ability to adapt to changing conditions and challenges.
- *Securing the digital transition.* The more widespread and ubiquitous digital technology is, the greater the threats of new and unforeseen vulnerabilities and new opportunities for criminals and violent extremists as well as new challenges, needs and tools for law enforcement authorities, infrastructures, businesses and individuals. Research on cybercrime and cybersecurity helps to address these matters. With the aim of creating a secure and trustworthy digital environment, Cluster 3 will invest in cybersecurity R&I to strengthen the EU's resilience, protect its infrastructures, and improve its ability to cope with cyber incidents. This will help increase the EU's open strategic autonomy in cybersecurity. Cluster 3 addresses cybercrime and the developing security threats in a digital age, such as criminal use of AI, to protect people, institutions and companies against cyber-enabled crimes. It will also continue to harness the opportunities of new technologies for law enforcement, border management and disaster risk reduction, and uphold the ability of the law enforcement to lawfully access and exploit digital evidence, without compromising or weakening privacy safeguards or cybersecurity (where relevant).
- *Supporting the green transition in civil security.* Climate change and environmental degradation are increasingly recognised as threat multipliers. Climate-related extreme

¹ The urgent need for which is emphasised throughout Sauli Niinistö's report "Safer Together: Strengthening Europe's Civilian and Military Preparedness and Readiness": https://commission.europa.eu/topics/defence/safer-together-path-towards-fully-prepared-union_en

events such as floods, droughts and forest fires pose increasing threats to people, nature, business and infrastructure. Geological hazards such as earthquakes, volcanic eruptions, and tsunamis are also threats affecting security. As EU Member States and Associated Countries face similar challenges, including varied and evolving transnational disasters, Cluster 3 will develop solutions to be applied throughout the EU to keep up to date with the developments. Cluster 3 will also address environmental crime. It will help understand how to manage borders in case of potential large-scale movements of people, including those caused by environmental stress. It will promote environmental sustainability of security solutions.

A second set of cross-cutting themes respond to challenges more specific to Cluster 3:

- *Ensuring legal and ethical outcomes that are supported by society.* Ethics, respect for the rule of law, fundamental rights, including human rights, privacy and the protection of personal data, as well as responsible research, must be at the heart of security research. Citizens and communities should be engaged, for example in assessing the societal impact of security technologies, to improve the quality of results and to build public trust. Social sciences and humanities (SSH) and social innovation need to be appropriately integrated into security research. The aim is to develop civilian security solutions that are as minimally intrusive as is possible while respecting freedoms, rights and values.
- *Protecting and empowering disadvantaged and vulnerable groups.* A range of groups are disproportionately exposed to violence and threats towards their security. These include, women, LGBTQI+, ethnic and racial minorities, persons with a migrant background, persons with disabilities, persons living with chronic illnesses, and elderly people and children. People depending on medicine are very vulnerable if supply chains are not secure, whether due to disasters or criminal activities. The needs and rights of travellers and migrants must be protected and promoted in border management activities. Vulnerable groups are at a higher risk of falling victim to trafficking in human beings. Research under Cluster 3 needs to consider how these groups can be better protected, including by analysing the structures that foster violence against these groups, developing measures to tackle such violence, and by promoting inclusive and empowering approaches that prioritise the needs and the rights of disadvantaged and vulnerable groups.
- *Improving market uptake of civil security research solutions.* Despite many success stories of tools and capabilities used by security practitioners originating from EU-funded security research projects, the uptake and deployment of successful research results remains a constant challenge. This challenge spans all destinations of Cluster 3. This Work Programme:
 - o continues the Cluster 3 practice of requiring projects to involve security practitioners alongside researchers and industry. Such involvement has shown its

added value in ensuring that tools, technologies and capabilities are developed for the benefit of and use by end-users and practitioners;

- o strengthens this involvement by introducing in many topics a requirement that proposals should plan a mid-term deliverable where practitioners involved in the project assess the project's mid-term outcomes;
- o innovation procurement is used under the SSRI destination this year with the open grounds preparatory work for future Pre-Commercial Procurement (PCP) topic, to bridge the gap between research, innovation and deployment, and thus strengthen the European market and European civil security industrial base;
- o encourages synergies with other EU funding programmes and instruments to enable or facilitate the uptake of the results of research into deployable solutions. Further information about this is given below;
- o the possibilities and support of security end-users like FRONTEX, EUROPOL, EU-LISA and the EU Drugs Agency, for testing and validation of security research results, should be used and expanded to the fullest extent;
- o supports projects which can directly or indirectly support public institutions intent on setting up their own innovation processes, which is to be encouraged;
- o encourages a competitive and innovative market, accessible for small and medium-sized enterprises (SMEs).

Where relevant, Cluster 3 will make use of space technology and Earth Observation.

International cooperation

Cluster 3 continues to require a specific approach to international cooperation to achieve the right balance between the benefits of exchange with key international partners, while ensuring the protection of the EU's security interests and the need for open strategic autonomy in critical sectors.

Under the destination 'Disaster-Resilient Society for Europe' (DRS), there is an established culture of comprehensive research collaboration with non-EU countries, taking account of the transnational aspect of different natural and human-made hazards and their causes (such as climate change). Therefore, under this destination, international cooperation is strongly encouraged, given the value of cooperating internationally, especially in developing technologies for first responders.

For the destinations relating to border management, the fight against crime and terrorism, infrastructure resilience and cybersecurity, international cooperation will be explicitly encouraged only where appropriate and specifically supportive of ongoing collaborative activities.

Synergies with other EU funding programmes and instruments

Cluster 3 will continue building and facilitating synergies with other EU funding programmes and instruments, in an approach with long-term capability development planning at its core. This is particularly important for civil security, where solutions are often demand-driven in a market that tends to be narrow, institutional, highly regulated, sensitive, and often fragmented along national lines.

From the demand side (funding for security practitioners and authorities, who are the users of security solutions), Cluster 3 will continue to operationalise the synergies with the home affairs funds: the Internal Security Fund (ISF) and the Integrated Border Management Fund (IBMF) in its two components, the Border Management and Visa Instrument (BMVI) and the Customs Control Equipment Instrument (CCEI). This will mean both facilitating the uptake of the results of Cluster 3 research by Member States and Associated Countries in their national programmes, and programming EU and specific actions with funding dedicated to taking up innovation resulting from Cluster 3 research.

In addition to the home affairs funds, Cluster 3 will continue promoting synergies with the Digital Europe Programme, the European Maritime Fisheries and Aquaculture Fund (EMFAF), the Union Civil Protection Mechanism (Knowledge for Action in Prevention and Preparedness calls for proposals, rescEU grants, early warning capabilities, and the training and exercises programme), the European Regional Development Fund (ERDF), the Cohesion Fund, the Neighbourhood, Development and International Cooperation Instrument – Global Europe instrument for the Southern and Eastern Neighbourhood and the Instrument for Pre-Accession, the Technical Support Instrument (TSI), the OLAF Union Anti-Fraud Programme (UAFP) and EU4Health.

From the supply side (funding for European innovators who develop and commercialise security solutions), the promotion of the uptake of the results of Cluster 3 research could involve the Innovation Fund and, to a lesser extent, EU actions under the ISF and the BMVI, as well as Health Emergency Preparedness and Response (HERA Invest) and the European Institute of Innovation and Technology (EIT).

Practical ways in which Cluster 3 will continue to improve and promote synergies include raising Member States' and Associated Countries authorities' and innovators' awareness of the opportunities for funding for uptake in other EU programmes and instruments, tracking and studying uptake of Cluster 3 projects' results in other EU programmes and instruments, and planning actions in other EU funding programmes and instruments to fund innovation in civil security that takes up the results of Cluster 3 research.

Research funded under Cluster 3 will continue to focus exclusively on civilian applications. Coordination with the European Defence Fund (EDF) and the EU Space Programme will be sought to strengthen cross-cluster complementarities also with actions foreseen in Cluster 4².

² To this end, the Commission and Member States have in place a mechanism for strategic planning and coordination of R&D related to the Copernicus Security Services (CSS), which maps current operational services and on-going and planned R&D initiatives, as well as it identifies end-user operational requirements and promotes sharing of information between projects with common interests.

Implementation

Proposals under certain topics in this Work Programme should plan their activities opting for the Financial Support to Third Parties (FSTP).

DRAFT

The mechanism drives R&D objectives listed in a Strategic Research Agenda (SRA) updated on a yearly basis. Engagement in the CSS-SRA information sharing process is therefore sought, for those projects planning to use Earth Observation and associated services for civil security applications.

Calls

Call - Civil Security for Society

HORIZON-CL3-2025-01

Overview of this call³

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ⁴	Indicative number of projects expected to be funded
		2025		
Opening: 12 Jun 2025 Deadline(s): 12 Nov 2025				
Destination - Better protect the EU and its citizens against Crime and Terrorism				
HORIZON-CL3-2025-01-FCT-01: Open topic on modern information and forensic evidence analysis and on frontline policing	RIA	18.00	Around 3.00	6
HORIZON-CL3-2025-01-FCT-02: Open topic on prevention, detection and deterrence of various forms of crime and terrorism through an enhanced understanding of the related societal issues	RIA	12.00	Around 3.00	4
HORIZON-CL3-2025-01-FCT-03: Open topic on improved intelligence picture and enhanced prevention, detection and deterrence of various forms of organised crime	IA	7.50	Around 3.75	2
HORIZON-CL3-2025-01-FCT-04:	IA	6.00	Around	1

³ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.
The Director-General responsible may delay the deadline(s) by up to two months.
All deadlines are at 17.00.00 Brussels local time.
The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

⁴ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

Horizon Europe - Work Programme 2025
Civil Security for Society

Humanitarian demining / Unexploded Ordnance Disposal (UXO) of civil areas and unexploded ordnance risk education			6.00	
Destination - Effective management of EU external borders				
HORIZON-CL3-2025-01-BM-01: Open topic on efficient border surveillance and maritime security	IA	10.00	Around 3.333333	3
HORIZON-CL3-2025-01-BM-02: Open topic on secured and facilitated crossing of external borders	RIA	9.00	Around 3.00	3
HORIZON-CL3-2025-01-BM-03: Open topic on better customs and supply chain security	IA	9.00	Around 3.00	3
Destination - Resilient Infrastructure				
HORIZON-CL3-2025-01-INFRA-01: Open topic for improved preparedness for, response to and recovery from large-scale disruptions of critical infrastructures	IA	15.00	Around 5.00	3
HORIZON-CL3-2025-01-INFRA-02: Open topic for role of the human factor for the resilience of critical infrastructures	RIA	7.00	Around 3.50	2
Destination - Disaster-Resilient Society for Europe				
HORIZON-CL3-2025-01-DRS-01: Open topic on citizen and regional and/or local authorities' engagement in enhanced disaster risk awareness, including education, and preparedness	RIA	12.00	Around 4.00	3
HORIZON-CL3-2025-01-DRS-02: Open topic on Improving disaster risk management and governance to ensure self-sufficiency and sustainability of operations in support of enhanced resilience	RIA	10.50	Around 3.50	3
HORIZON-CL3-2025-01-DRS-03: Open topic on testing / validating tools, technologies and data used in cross-border prevention, preparedness and responses to climate extreme and geological events and chemical, biological	IA	13.50	Around 4.50	3

Horizon Europe - Work Programme 2025
Civil Security for Society

or radiological emergency threats

General conditions relating to this call

<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and exclusion</i>	The criteria are described in General Annex C.
<i>Award criteria</i>	The criteria are described in General Annex

	D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

DRAFT

Destinations

Destination - Better protect the EU and its citizens against Crime and Terrorism

As underlined in the Horizon Europe strategic plan 2025-2027, proposals for topics under this Destination should “*continue developing European practitioners’ capabilities to effectively prevent, detect and investigate terrorism, organised crime [...], cybercrime, the most harmful crimes [...] and criminal aspects of behaviour on the internet [...]. Investment provides further support for modern information analysis, modern forensics tools [...], lawful evidence collection, and the recognition of societal problems arising from various forms of crime. This destination will also prepare policymakers, practitioners, companies and the general public for tackling emerging and evolving threats, by identifying them early on, flagging them and making preliminary recommendations on how to deal with them. Areas of new or increased focus will include the identification and investigation of criminal networks including emerging phenomena [...]. The destination will continue to pay close attention to financial crimes, as a common denominator for most criminal activities.*”

This destination will support the implementation of the European Commission political guidelines 2024-2029 for a ‘Safer and more secure Europe’, a ‘Preparedness Union’, with ‘Stronger Common Borders’, protecting democracy and putting research and innovation at the heart of a resilient economy. Overall, research under this Cluster should continue to focus on preserving and securing citizens’ basic right to feel safe. This destination will support the European Commission efforts towards:

- a new Counter-Terrorism Agenda to address new and emerging threats, and,
- the gradual establishment and further development of the planned European Critical Communication System for public authorities in charge of security and safety.

To this end, proposals should contribute to the achievement of one or more of the following impacts:

- Modern information analysis for Police Authorities, allowing them to efficiently fight criminals and terrorists who use novel technologies;
- Improved forensics and lawful evidence collection, increasing the capabilities to apprehend criminals and terrorists and bring them to the court;
- Enhanced prevention, detection and deterrence of societal issues related to various forms of crime, including cybercrime, and terrorism, such as violent radicalisation, domestic and sexual violence, including child sexual abuse, or juvenile offenders;
- Increased security of citizens against terrorism, including in public spaces (while preserving their quality and openness);

- Improved intelligence picture and enhanced prevention, detection and deterrence of various forms of organised crime;
- More secure cyberspace for citizens, especially children and elderly people, through a robust prevention, detection, and protection from cybercriminal activities.

More specifically, in the rapidly evolving technological and societal landscape, with climate change and environmental aspects increasingly seen as security issues, and with growing threats to vulnerable citizens, various forthcoming challenges that European society faces deserve dedicated research and innovation actions in the scope of this Destination. Some of them are:

- Challenges related to modern information and forensic evidence analysis as well as to frontline policing, such as
 - o criminal use of various forms of cutting-edge technologies,
 - o development of novel methods of forensics analysis based on new and emerging technologies, e.g., forensic on-site analysis with mobile real-time cloud sharing applications,
 - o lawful access to and integrity of data and evidence, or
 - o modern physical threats to frontline police and corresponding needs for a next generation smart police protective gear;
- Challenges regarding prevention, detection and deterrence of various forms of crime and terrorism through an enhanced understanding of the related societal issues, in the context of:
 - o crime, such as
 - vulnerability of children and youth, both offline and online,
 - increased availability and use of stimulants and synthetic drugs, or
 - forest fires of criminal origin, and other environmental crimes;
 - o terrorism and radicalisation, such as
 - blurring of lines between different types of terrorism, including right-wing, left-wing, anarchist, jihadist, and other ideologies, or
 - expansion of lone actors' attacks in the background of social isolation, polarisation and recurrent economic crises;
 - multiplication of non-violent forms of radicalisation, such as malign foreign influences and funding aimed at challenging and undermining EU values.

- Challenges related to improving the intelligence picture and enhancing the prevention, detection and deterrence of various forms of organised crime, such as
 - o organised criminal groups profiting from migrant smuggling and trafficking in human beings;
 - o drug-related violence and the association between involvement in the drug market with other forms of criminality and violent crime, or
 - o money laundering.

Research and innovation funded under this Destination will contribute to policy objectives such as those of the:

- Police cooperation package⁵ (information exchange⁶, automated data exchange for police cooperation - “Prüm II”⁷, operational cross-border police cooperation⁸);
- Counter-Terrorism Agenda for the EU⁹ (incl. Regulation 2021/784/EU on addressing dissemination of terrorist content online & Directive 2017/541/EU on combating terrorism);
- EU C-UAS Strategy¹⁰ (counter-drone policy);
- EU Strategy to Tackle Organised crime¹¹;
- EU Strategy on combatting Trafficking in Human Beings¹² (the modified Directive on preventing and combating trafficking in human being and protecting its victims), and the Proposal to strengthen EU legislation to prevent and fight migrant smuggling¹³ (notably its aspect of reinforcing Europol’s role in the fight against migrant smuggling and trafficking in human beings);
- EU drugs measures (Strategy¹⁴, Action Plan¹⁵ and Roadmap to fight Drugs Trafficking and Organised Crime¹⁶);
- EU environmental crime measures¹⁷ (review of the Directive 2008/99/EC on protection of the environment through criminal law);

⁵ COM/2021/782 final, COM/2021/784 final, ST/8720/2022/INIT.

⁶ Directive (EU) 2023/977.

⁷ Regulation (EU) 2024/982.

⁸ Council Recommendation (EU) 2022/915.

⁹ COM/2020/795 final.

¹⁰ COM/2023/659 final.COM/2023/659 final.

¹¹ COM/2021/170 final.

¹² COM/2021/171 final; Directive (EU) 2024/1712; COM/2023/755 final.

¹³ COM/2023/754 final.

¹⁴ 14178/20.

¹⁵ ST/9819/2021/INIT.

¹⁶ COM/2023/641 final.

¹⁷ Directive (EU) 2024/1203.

- EU anti-corruption measures (Communication¹⁸, proposal for a Directive¹⁹);
- Directive (EU) 2019/713 on non-cash means of payment;
- EU strategy on a more effective fight against child sexual abuse²⁰ (incl. Proposal for a regulation to prevent and combat child sexual abuse²¹); and
- EU Regulation (2022/2371) on serious cross-border threats to health.

This Destination will also support, whenever appropriate and applicable, proposals with:

- a clear strategy on how they will adapt to the fast-evolving environment in the area of fight against crime and terrorism (evolution of related technologies, evolution of criminal modi operandi and business models related to these technologies, etc.);
- the involvement of Police Authorities in their core;
- the active role for Non-Governmental Organisations (NGOs) and Civil Society Organisations (CSOs);
- the active involvement of Small and Medium Enterprises (SMEs);
- a minimum-needed platform, i.e., tools that are modular and can be easily plugged into another platform (in order to avoid platform multiplication);
- tools that are developed and validated against practitioners' needs and requirements;
- tools following existing or new standards for data exchange, including cybersecurity best-practices;
- a robust plan on how they will build on the relevant predecessor projects;
- education and training aspects, especially for Police Authorities and other relevant practitioners, as well as information sharing and awareness raising of the citizens;
- a clear strategy on the uptake and sustainability of the project results, with special attention to the access at little or no cost to created tools and methodologies by Police Authorities involved in the project;
- a well-developed plan both on how research data for training and testing will be obtained, in order to reach the requested Technology Readiness Levels (TRLs), and on how the specific TRL will be measured.

¹⁸ JOIN(2023) 12 final.

¹⁹ COM/2023/234 final.

²⁰ COM/2020/607 final.

²¹ COM/2022/209 final.

Where possible and relevant, synergy-building and clustering initiatives with successful proposals in the same area should be considered, in coordination with the Community for European Research and Innovation for Security (CERIS)²².

Proposals are invited against the following topic(s):

HORIZON-CL3-2025-01-FCT-01: Open topic on modern information and forensic evidence analysis and on frontline policing

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 18.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 2 Police Authorities²³ from at least 2 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5 by the end of the project – see General Annex B.

²² https://home-affairs.ec.europa.eu/networks/ceris-community-european-research-and-innovation-security_en

²³ In the context of this Destination, ‘Police Authorities’ means public authorities explicitly designated by national law, or other entities legally mandated by the competent national authority, for the prevention, detection and/or investigation of terrorist offences or other criminal offences, specifically excluding police academies, forensic institutes, training facilities as well as border and customs authorities.

<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio, grants will be awarded to applications not only in order of ranking but at least also to one project that is the highest ranked within each of the three options (Option a), Option b) and Option c)), provided that the applications attain all thresholds.</p>
<i>Security Sensitive Topics</i>	<p>Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.</p>

Expected Outcome: Project results are expected to contribute to some or all of the following expected outcomes:

- Modern, uniform and validated tools, skills, methodologies and innovative training curricula for security practitioners (Police Authorities and forensic institutes in Europe) to prevent, detect and investigate criminal and terrorist offences, including the lawful court-proof collection of crime evidence;
- Improved mechanisms for cross-border information exchange in the fight against crime and terrorism, taking into account all applicable legislation and fundamental rights;
- Evidence-based support to policy-makers on shaping and tuning of regulation related to modern information analysis, forensic evidence analysis or frontline policing.

Scope: Under the open topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions for improving modern information and forensic evidence analysis or frontline policing, that are not covered by topics of Horizon Europe Calls Fighting Crime and Terrorism 2023-2024. If they relate to some of the topics covered by Horizon Europe Calls Fighting Crime and Terrorism 2021-2022, the proposals should explain how they will build on and not duplicate them.

Proposals are expected to address one of the following options:

Option a: tackling advanced technology challenges;

Option b: modern forensics analysis using new and emerging technologies;

Option c: modernisation of frontline policing.

Adapted to the nature, scope and type of proposed projects, proposals should also convincingly explain how they will plan and/or carry out demonstration, testing or validation of developed tools and solutions. Furthermore, proposals should outline the plans to develop possible future uptake and upscaling at national and EU level for possible next steps once the project is finalised. Proposals should also consider, build on if appropriate and not duplicate

previous research, including but not limited to research by other Framework Programmes' projects.

Coordination among the successful proposals from this topic should be envisaged to avoid duplication and to exploit complementarities as well as opportunities for increased impact. For Option b), the active involvement, as beneficiaries, of forensic institutes from EU Member States or Associated Countries is recommended.

The proposals funded under this topic that concern issues which are within the mandate of Europol²⁴ are expected to engage with the Europol Innovation Lab during the lifetime of the project, including validating the outcomes, with the aim of facilitating future uptake of innovations for the law enforcement community. Similarly, if the proposals concern drug-related issues, they are expected to engage with the EU Drugs Agency during the lifetime of the project, including validating the outcomes.

In order to ensure project impact and the active involvement of and timely feedback from relevant security practitioners, i.e., Police Authorities and/or forensic institutes, proposals should plan a mid-term deliverable consisting in the assessment of the project's mid-term outcomes, performed by the practitioners involved in the project.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL3-2025-01-FCT-02: Open topic on prevention, detection and deterrence of various forms of crime and terrorism through an enhanced understanding of the related societal issues

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 12.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply:

²⁴ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex%3A32016R0794> (Annex I)

	<p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 1 Police Authority²⁵ and at least 1 Civil Society Organisation, CSO (or Non-Governmental Organisation, NGO) from at least 2 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio, grants will be awarded to applications not only in order of ranking but at least also to one project that is the highest ranked within each of the two options (Option a and Option b), provided that the applications attain all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries must provide financial support to third parties in the form of grants. The maximum amount to be granted to each third party is EUR 60 000 to support effective collaboration and/or coordination with additional relevant national Police Authorities and/or CSOs/NGOs from EU Member States or Associated Countries.</p>
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: Project results are expected to contribute to some or all of the following expected outcomes:

²⁵ In the context of this Destination, ‘Police Authorities’ means public authorities explicitly designated by national law, or other entities legally mandated by the competent national authority, for the prevention, detection and/or investigation of terrorist offences or other criminal offences, specifically excluding police academies, forensic institutes, training facilities as well as border and customs authorities.

- Improved, modern, uniform and validated tools, skills or methodologies as well as innovative training curricula for security practitioners (Police Authorities, Non-Governmental Organisations, Civil Society Organisations) in Europe, to prevent, detect and deter criminal or terrorist offences, taking into account all applicable legislation and fundamental rights;
- Enhanced understanding of the cultural and societal aspects of crime or terrorism/radicalisation, as well as on the key challenges related to combating them;
- Evidence-based support to policymakers on shaping and tuning of regulation related to crime or terrorism/radicalisation;
- Enhanced perception by citizens that Europe is an area of freedom, security and justice, fully respecting privacy and human rights, thanks to, e.g., innovative awareness-raising campaigns explaining to citizens the key and evolving mechanisms of crime or terrorism/radicalisation, and how to protect against them.

Scope: Under the open topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions for improving the prevention, detection and deterrence of various forms of crime or terrorism/radicalisation through an enhanced understanding of the related societal issues. These challenges and/or solutions should not be covered by topics of Horizon Europe Calls Fighting Crime and Terrorism 2023-2024. If they relate to some of the topics covered by Horizon Europe Calls Fighting Crime and Terrorism 2021-2022, the proposals should convincingly explain how they will build on and not duplicate them. The same applies regarding Horizon Europe projects under the calls HORIZON-CL2-2022-DEMOCRACY-01-05: Evolution of political extremism, and HORIZON-CL2-2024-DEMOCRACY-01-05: Gender-roles in extremist movements.

Proposals are expected to address one of the following options:

Option a: societal issues related to crime;

Option b: societal issues related to terrorism and radicalisation.

Adapted to the nature, scope and type of proposed projects, proposals should also convincingly explain how they will plan and/or carry out demonstration, testing or validation of developed tools and solutions. Furthermore, proposals should outline the plans to develop possible future uptake and upscaling at national and EU level for possible next steps once the project is finalised. Proposals should also consider, build on if appropriate and not duplicate previous research, including but not limited to research by other Framework Programmes' projects.

Coordination among the successful proposals from this topic should be envisaged to avoid duplication and to exploit complementarities as well as opportunities for increased impact.

The proposals funded under this topic that concern issues which are within the mandate of Europol²⁶ are expected to engage with the Europol Innovation Lab during the lifetime of the project, including validating the outcomes, with the aim of facilitating future uptake of innovations for the law enforcement community. Similarly, if the proposals concern drug-related issues, they are expected to engage with the EU Drugs Agency during the lifetime of the project, including validating the outcomes.

If the funded proposal concerns radicalisation, the consortium is encouraged to liaise with the EU Knowledge Hub on prevention of radicalisation with the aim of facilitating the streamlining of their priorities and the dissemination of their results.

To ensure the active involvement of and timely feedback from relevant security practitioners, i.e., Police Authorities and Non-Governmental Organisations / Civil Society Organisations, proposals should plan a mid-term deliverable consisting in the assessment of the project's mid-term outcomes, performed by the practitioners involved in the project.

Activities proposed within this topic should address both technological and societal dimensions of the tackled challenge in a balanced way. This topic requires the effective contribution of SSH disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related innovation activities.

Proposals should plan their activities opting for the Financial Support to Third Parties in order to provide financial support to practitioners (Police Authorities and/or Non-Governmental Organisations/Civil Society Organisations) for expanding the proposed work in terms of additional user groups, complementary assessments, technology- or methodology-testing activities. From 5% up to 20% of the EU funding requested by the proposal may be allocated to the purpose of financial support to third parties.

Proposals must clearly describe the objectives and the expected results to be obtained, including the elements listed in the application template. Proposals are also expected to describe the methods and processes relevant to comply with the general eligibility conditions for financial support to third parties set out in General Annex B and to demonstrate effectiveness (impact).

HORIZON-CL3-2025-01-FCT-03: Open topic on improved intelligence picture and enhanced prevention, detection and deterrence of various forms of organised crime

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.75 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal

²⁶ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex%3A32016R0794> (Annex I)

	requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 7.50 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 3 Police Authorities²⁷ from at least 3 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Improved, modern, uniform and validated tools, skills, methodologies and innovative training curricula for Police Authorities in Europe, to prevent, detect and investigate organised crime offences, including the early detection of criminal networks and the identification of emerging trends and challenges;

²⁷ In the context of this Destination, ‘Police Authorities’ means public authorities explicitly designated by national law, or other entities legally mandated by the competent national authority, for the prevention, detection and/or investigation of terrorist offences or other criminal offences, specifically excluding police academies, forensic institutes, training facilities as well as border and customs authorities.

- Improved mechanisms for the use of cross-border tools to facilitate secure information exchange in the fight against organised crime, including criminal networks, taking into account all applicable legislation and fundamental rights;
- Enhanced understanding of the key challenges and best practices related to combating cross-border organised crime;
- Evidence-based support to policy-makers on shaping and tuning of regulation related to cross-border organised crime including criminal networks.

Scope: Under the open topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions for improving the intelligence picture and enhancing the prevention, detection and deterrence of various forms of organised crime, that are not covered by topics of Horizon Europe Calls Fighting Crime and Terrorism 2023-2024. If they related to some of the topics covered by Horizon Europe Calls Fighting Crime and Terrorism 2021-2022, the proposals should convincingly explain how they will build on and not duplicate them. Adapted to the nature, scope and type of proposed projects, proposals should also convincingly explain how they will plan and/or carry out demonstration, testing or validation of developed tools and solutions. Furthermore, proposals should outline the plans to develop possible future uptake and upscaling at national and EU level for possible next steps once the project is finalised. Proposals should also consider, build on if appropriate and not duplicate previous research, including but not limited to research by other Framework Programmes' projects.

Coordination among the successful proposals from this topic should be envisaged to avoid duplication and to exploit complementarities as well as opportunities for increased impact. If relevant, the active involvement, as beneficiaries, of Border Guard and/or Customs Authorities from EU Member States or Associated Countries is recommended.

The proposals funded under this topic that concern issues which are within the mandate of Europol²⁸ are expected to engage with the Europol Innovation Lab during the lifetime of the project, including validating the outcomes, with the aim of facilitating future uptake of innovations for the law enforcement community. Similarly, if the proposals concern drug-related issues, they are expected to engage with the EU Drugs Agency during the lifetime of the project, including validating the outcomes.

To ensure the active involvement of and timely feedback from relevant security practitioners, i.e., Police Authorities and Border Guards / Customs Authorities, proposals should plan a mid-term deliverable consisting in the assessment, performed by the practitioners involved in the project, of the project's mid-term outcomes.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

²⁸ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex%3A32016R0794> (Annex I)

HORIZON-CL3-2025-01-FCT-04: Humanitarian demining / Unexploded Ordnance Disposal (UXO) of civil areas and unexploded ordnance risk education

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 6.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least one international humanitarian demining organisation and two local or regional Non-Governmental Organisations active in humanitarian demining from at least three different EU Member States or Associated Countries, including Ukraine. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>The participation of at least one entity from Ukraine in the consortium is mandatory with competences in humanitarian demining / Unexploded Ordnance Disposal (UXO).</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Improved, modern and validated tools, skills, methodologies and innovative training curricula for practitioners involved in humanitarian demining and Unexploded Ordnance Disposal (UXO) of civil areas, taking into account all applicable legislation and fundamental rights;
- Improved education activities aimed at reducing risks of injuries from anti-personnel mines and other unexploded ordnance;
- Enhanced understanding of the key challenges and best practices related to humanitarian demining and to unexploded ordnance risk education taking into account the experience of Ukrainian participants;
- Evidence-based support to policy-makers on shaping of the EU mine action.

Scope: In post-conflict areas, lives of civilians are in danger and the return of economic activity is hindered because the land is contaminated by anti-personnel mines and other unexploded ordnance. The EU provides a continuous support to humanitarian demining activities in heavily mine-affected countries and regions all over the world, thus promoting peace, security, post-conflict reconstruction, as well as social and economic rehabilitation. In Ukraine, mine action is a critical aspect of the humanitarian emergency response, the goal of which is to support the return of the civilian population and the rebuilding of crucial civilian infrastructure. As part of their mine action operations, EU Member States and Horizon Europe Associated Countries, such as Croatia, Cyprus, Bosnia and Herzegovina, and Armenia also strive to make their land completely free of anti-personnel mines and other explosive ordnance.

Humanitarian demining is not to be confused with military demining, which is the process undertaken by soldiers to clear a safe path so they can advance during conflict.

Various humanitarian demining initiatives have been developed, which often incur high costs and are typically slow because no mistakes are allowed. In addition, due to a large diversity of contaminated areas, types of anti-personnel mines and of their deployment methods, as well as a more complex contamination that includes unexploded ordnance and improvised explosive devices, there is no single solution to the problem. Finally, new anti-personnel mines are being developed and new mine deployment techniques being used. Therefore, new, improved, innovative or disruptive solutions, accompanied by related training curricula, are needed to enhance humanitarian demining activities in civil areas. Since the aim of humanitarian demining is to restore peace and security, it has to be complemented by an adequate risk education, raising awareness of civilians of the risks from anti-personnel mines and other unexploded ordnance, which will help them act in such a way that will reduce the risk to people and the environment. A range of risk education initiatives exist, but they usually lack, among others, collaboration with related Non-Governmental Organisations (NGOs), sustainability, and a comprehensive needs assessment aiming to improve their effectiveness.

Within this topic, improved, modern and validated tools, skills, methodologies and innovative training curricula for practitioners are expected, which are adapted to regional and cross-border contexts.

Proposals should also explain how they will plan and/or carry out demonstration, testing or validation of developed tools and solutions. Furthermore, proposals should outline the plans to develop possible future uptake and upscaling at national and EU and international level for possible next steps once the project is finalised. Proposals should also consider, build on if appropriate and not duplicate previous research, including but not limited to research by other Framework Programmes' projects²⁹. Proposals are also expected to connect and create synergies and explore complementarities with other related initiatives in humanitarian demining and in explosive ordnance risk education.

Activities proposed within this topic should address both technological (humanitarian demining) and societal (explosive ordnance risk education) dimensions in a balanced way.

To ensure the active involvement of and timely feedback from relevant security practitioners, proposals should plan a mid-term deliverable consisting in the assessment, performed by the practitioners involved in the project, of the project's mid-term outcomes.

Within this topic, the European Commission encourages all potential participants to create, where possible, opportunities for the affected persons and entities, in particular Ukrainian national mine action authorities, researchers and innovators, demining agencies or companies as well as NGOs.

²⁹ Such the TIRAMISU and DBOX projects funded under FP7; projects MUNIMAP, BASTA, ExPloTect; project(s) funded under HORIZON-CL3-2023-BM-01-02 – “Identify, inspect, neutralise Unexploded Ordnance (UXO) at sea”; project(s) funded under EMFAF-2023-PIA-FLAGSHIP-MUNITION – “Regional flagship projects supporting a sustainable blue economy in EU sea basins – submerged munitions in the Baltic Sea”; project(s) funded under PPPA-2024-MUNITIONS – “Saving our Seas – Reducing the danger of munitions dumped in European seas”.

Destination - Effective management of EU external borders

Proposals for topics under this Destination should contribute to the following expected impact: “facilitating legitimate movement of passengers and goods into the EU, while preventing illicit acts” of the Horizon Europe strategic plan 2025-2027.

This destination will support the implementation of the European Commission political guidelines 2024-2029 for a ‘Safer and more secure Europe’, a ‘Preparedness Union’, with ‘Stronger Common Borders’, protecting democracy and putting research and innovation at the heart of a resilient economy. Overall, research under this Cluster should continue to focus on preserving and securing citizens’ basic right to feel safe. This destination will support the European Commission efforts towards:

- a wider EU Port Strategy focusing on security and a new European action plan against drug trafficking.
- boosting security research for stronger common borders / more secure and more fluid borders.

Projects funded under the topics of Work Programme 2025 will promote technological and social research and innovation and further explore and develop future capabilities for European practitioners in the areas of border management, customs and supply chain security, and civilian maritime and aviation security. Capability areas to address may include:

- monitoring, preparedness and reaction in border management tasks, managing irregular or illegal activities involving people or goods across external borders of the EU;
- safeguarding human rights, and ensuring legal compliance, in efficient border management;
- integrated and continuous border surveillance, situational awareness (including but not limiting to maritime situational awareness) and analysis support;
- safety, user experience and performance of practitioners’ staff in border management;
- security, privacy and usability of identity and (travel) documents;
- facilitating travel of bona fide passengers across external borders of the EU;
- data analysis on documents, biometrics, or cargo compliant with GDPR³⁰ and EU Artificial Intelligence Act³¹ and compatible with sandboxes approaches;
- detection of dangerous, illicit and illegal goods and materials trafficked through external borders of the EU and the supply chain;
- prevention and disruption of such trafficking.

³⁰ Regulation (EU) 2016/679.

³¹ Regulation (EU) 2024/1689.

Research and innovation funded under this Destination will contribute to policy objectives such as:

- the border management and security dimensions of the Pact on Migration and Asylum³²;
- the Multiannual Strategic Policy for European Integrated Border Management³³;
- the Capability Roadmap of the European Border and Coast Guard³⁴;
- the proposals to strengthen EU legislation to prevent and fight against migrant smuggling³⁵;
- the proposals on digitalisation of travel documents and facilitation of travel³⁶;
- the civil security aspects of the updated EU Maritime Security Strategy³⁷;
- the proposals for EU Customs reform³⁸.

Research and innovation will contribute to sustain and improve capabilities to cope with potential future critical situations or emerging challenges regarding both the flow of people and the flow of goods across external EU borders. Examples may include:

- threats of illicit flows of dangerous materials and weapons because of conflicts outside the Union;
- the potential for large-scale movements of people including those resulting from the instrumentalisation of irregular migration, from conflicts, or from social, economic, environmental and climate stress in the EU neighbourhood;
- the exploitation and smuggling of migrants across the EU's external borders, in particular of vulnerable groups including women and girls.

Furthermore, challenges can be exacerbated by the rapid adoption of new technologies by criminal organisations, and how new technologies help the sophistication of organised crime methods.

Among technological approaches, for example, artificial intelligence (AI) offers many opportunities to improve border management services, including analytical support. At the same time AI also brings challenges such as morphing; potential misuse of data; doubts of bias or unexplained decision supports. Research and innovation are also necessary to minimise risks from these challenges, also in light of the full entry into force of the EU

³² COM (2020) 610 final.

³³ COM (2023) 146 final.

³⁴ FRONTEX MB Decision 16/2024.

³⁵ COM/2023/754 final; COM/2023/755 final.

³⁶ COM (2021) 277 final; COM (2024) 670 final.

³⁷ JOIN/2023/8 final.

³⁸ COM (2023) 257 final; COM (2023) 258 final – 2023/0156(COD); COM (2023) 259 final – 2023/0157(NLE); COM (2023) 262 final – 2023/0158(CNS).

Artificial Intelligence Act. Monitoring large maritime areas from space is possible today through the Copernicus Maritime and Border Surveillance services, for a first screening of potential risks. But ‘new space’ solutions are also coming to the market and need validation in real-life operational scenarios, an area where R&D can be of help.

Furthermore, research and innovation under this Destination will contribute to:

- lower the environmental impact and footprint of border, customs and supply chain security tasks, through innovative solutions and methods;
- integrate and improve safety and cybersecurity of EU information systems, of innovative equipment, and of information and data from different sources in these areas, especially during their exchange at operational or tactical levels;
- safeguard the open strategic autonomy and technological sovereignty of the EU in critical security areas by contributing to a more competitive and resilient EU security technology and industrial base;
- facilitate spin-in of technology from other clusters contributing to the objectives of the call.

Research projects funded under this Destination should engage with all stakeholders involved, including travellers, migrants, and operators and service providers, as relevant. Research will integrate approaches to safeguarding and promoting EU values and fundamental rights in these areas, with a special focus on human rights.

Projects should align and contribute primarily to the realisation of the Capability Roadmap of the European Border and Coast Guard (EBCG) published by the EBCG Agency (Frontex), especially the Roadmap’s mid- and long-term perspectives. The Roadmap provides strategic vision for investments into the development of capabilities and is the result of integrated planning between the Member States and the European Border and Coast Guard Agency. Proposals submitted under this Destination should explain the alignment primarily with the Capability Roadmap and the plans for further uptake of the research outcomes, especially by involved practitioners in line with their national Capability Development Plans.

Frontex will be closely associated with and will assist Member States and the European Commission in drawing up and implementing relevant research and innovation activities. The European Union Agency for the Operational Management of Large-Scale IT Systems in the Area of Freedom, Security and Justice (eu-LISA) may also assist the European Commission on relevant research and innovation activities and specific topics. Hence proposals should consider and foresee that Frontex and/or eu-LISA may for example observe projects’ pilots and demonstrations, with the aim of facilitating future uptake of innovations for the border and coast guard community. Furthermore, funded projects will likely have the opportunity of exploiting the core capabilities of the “Frontex Technology and Innovation Centre”, Frontex’s future collaborative space for testing, demonstration, simulation and assessment of solutions,

processes and procedures. At the stage of proposal preparation, Frontex and/or eu-LISA will not provide any guidance on, or otherwise be involved in the preparation of, project proposals.

To accomplish the objectives of this Destination, additional eligibility conditions have been defined regarding the active involvement of relevant security practitioners or end-users in the research projects' consortia.

Proposals submitted under this Destination should demonstrate how they plan to build on relevant predecessor projects; to consider the citizens' and societal perspectives; to include education, training and awareness raising for practitioners and citizens; to measure the achieved TRL.

Regarding synergies and complementarities, this Destination will develop knowledge and technologies that may be taken up by other instruments, such as the Integrated Border Management Fund, in its components of the Border Management and Visa Instrument (BMVI) and Customs Control Equipment Instrument (CCEI). Member States authorities participating in research projects can plan to use those instruments for uptake (piloting, testing, validation, scale-up, transfer, acquire, deploy, etc) of innovative solutions developed from research, as early as TRL 7.

Cluster 3 will further incentivise the use of European Space Programmes' services for border management innovation where relevant and their services and capabilities, including demonstration and validation of new technologies in operational environments.

Successful proposals under this Destination are invited to cooperate with other EU-led or EU-funded initiatives in the relevant domains, such as the Knowledge Networks for Security Research & Innovation funded under Horizon Europe Cluster 3, or other security research and innovation working groups set-up by the Commission or EU Agencies.

Funded projects are encouraged to liaise with the European Commission's Joint Research Centre (JRC), for example with regards to a possibility of testing the relevant research outputs at the JRC Border Security Lab, and to apply developments for security applications from space, through the *Strategic Research Agenda* for the Copernicus Security Services.

Where possible and relevant, synergy-building and clustering initiatives with projects in the same area should be considered, in coordination with the Community for European Research and Innovation (CERIS)³⁹.

Proposals are invited against the following topic(s):

HORIZON-CL3-2025-01-BM-01: Open topic on efficient border surveillance and maritime security

Call: Civil Security for Society

³⁹ https://home-affairs.ec.europa.eu/networks/ceris-community-european-research-and-innovation-security_en

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.333333 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 2 Border or Coast Guard Authorities from at least 2 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁴⁰.</p>
<i>Security Sensitive</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and

⁴⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

<i>Topics</i>	SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.
---------------	--

Expected Outcome: Project results are expected to contribute to all of the following expected outcome(s):

- Improved security of EU external borders, or of maritime environment, infrastructures and activities, against natural, accidental or incidental disasters; challenges such as illegal trafficking (covering air, maritime, underwater, land/surface), irregular migration or exceptional situations of mass arrivals at external borders, illegal exploitation of natural resources, piracy and potential terrorist attacks, cyber and hybrid threats;
- Sustained and improved surveillance, real-time situational awareness, and reaction capabilities to cope with potential critical situations at the EU external borders;
- Improved decision-making processes and capabilities for assessing, confirming and responding to distress situations at sea and land, allowing a better and faster response.

Scope: Under this topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions for improving capabilities of practitioners in border surveillance and/or maritime security. External border areas, pre-frontier areas as well as contexts and scenarios in Europe's border regions that may in the future be impacted by geopolitical instabilities, hybrid threats, or tensions from outside the EU, and need sustained and improved surveillance and reaction capabilities, could be particularly considered. If they relate to some of the topics covered by Horizon Europe Calls Effective Management of EU External Borders 2021-2022 or 2023-2024, the proposals should convincingly explain how they will build on and not duplicate them.

Proposals may also address capabilities of information exchange, capabilities for detection of illegal activities, and/or solutions that can be deployed efficiently across diverse geographical regions; capabilities for operational event data recording; capabilities to detect irregular activities in areas of terminals for travel (air, sea) or logistics terminals around a Border Control Point, without disrupting the flow of operations; capabilities that support and help the decision-making process and facilitate operating in different scenarios (air, sea, land) simultaneously.

The EBCG Capability Roadmap recognises that future surveillance capabilities that help detect cross-border irregularities and cases requiring Search and Rescue activities are essential. Solutions should be modular and scalable to cater to the regional and challenges specificities.

Examples of technologies and solutions that may be relevant for this topic include but are not limited to: sensing (at tactical, operational, and/or strategic levels), autonomous platforms, vehicles and systems (aerial, ground, surface or underwater, vessel-based or not, mobile or land-borne, etc); interconnectivity between sensors and platforms and automated data fusion; data processing systems; image and signal processing and analysis; robotics; computing

technologies including edge and cloud computing; decision-support systems and human-machine interfaces.

Projects should integrate:

- perspectives of safeguarding and promoting human rights, including gender equality, developing solutions that contribute to those safeguarding and promotion;
- inputs from human rights, law and ethical perspectives, as well as the consideration and views of individuals and society, as well as a gender sensitive approach, as appropriate; proposals can engage with civil society organisations for wider input and support;
- aspects of cybersecurity of the technology proposed, and the protection of communication systems and networks involved in the solutions, if and as relevant.

Proposals that include solutions and/or methods that would contribute to a lower environmental impact and footprint, better cost-efficiency, better energy-efficiency, and/or better operational autonomy of the capabilities and solutions in this topic, would be welcome.

Depending on the particular scope of the proposal, participation of Police and/or Customs Authorities is welcome.

To ensure the active involvement of and timely feedback from relevant security practitioners, proposals should plan a mid-term deliverable consisting in the assessment of the project's mid-term outcomes, performed by the practitioners involved in the project.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL3-2025-01-BM-02: Open topic on secured and facilitated crossing of external borders

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 9.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply:

	<p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 2 Border or Coast Guard Authorities from at least 2 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁴¹.</p>
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: Project results are expected to contribute to the following expected outcome(s):

- Improved border crossing experience for travellers and border authorities’ staff (including customs, coast and border guards), while maintaining security and monitoring of movements across EU external borders, supporting the Schengen area, reducing illegal movements of people and goods across those borders and protecting fundamental rights of travellers, both EU citizens and Third Country Nationals.

⁴¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: Under this topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions for improving capabilities of practitioners for the secured and facilitated checks of crossings of external borders. Contexts and scenarios in Europe's border regions that may in the future be impacted by geopolitical instabilities or tensions from outside the EU, and need sustained and improved surveillance and reaction capabilities, could be particularly considered. Moreover, mechanisms for detecting the presence of threats in travel flows should be investigated. If they relate to some of the topics covered by Horizon Europe Calls Effective Management of EU External Borders 2021-2022 or 2023-2024, the proposals should convincingly explain how they will build on and not duplicate them.

Proposals may also address capabilities related to possible future digitalised travel credentials (DTC), including though not limited to: Type-1 and Type-2 and forward integration with secure digital citizenship wallet(s); identification and verification in the context of border checks; optimisation of resources in the context of border checks.

According to the European Border and Coast Guard (EBCG) Capability Roadmap, legal border crossings should be as swift and simple as possible, preferably fully automated. Border Crossing Points should also have the ability to detect any unauthorised crossings of persons or goods.

Examples of technologies and solutions that may be relevant for this topic include but are not limited to: secure and private data approaches for applications in border checks; fuzzy searches capabilities; data communication, translation and sharing solutions; biometrics; age assessment methods; fraudulent documents detection; automation, exchange and interoperability for systems involved in border checks.

Projects should integrate aspects of:

- perspectives of safeguarding and promoting human rights, developing solutions that contribute to those safeguarding and promotion;
- inputs from human rights, law and ethical perspectives, as well as the consideration and views of individuals and society and the societal dimension, including a gender sensitive approach, as appropriate; proposals can engage with citizens and civil society for wider input and support;
- aspects of cybersecurity of the technology proposed, and the protection of communication systems and networks involved in the solutions, if and as relevant.

Proposals that include solutions and/or methods that would contribute to a lower environmental impact and footprint, better cost-efficiency, better energy-efficiency, and/or better operational autonomy of the capabilities and solutions in this topic, would be welcome.

Depending on the particular scope of the proposal, participation of Police and/or Customs Authorities is welcome.

To ensure the active involvement of and timely feedback from relevant security practitioners, proposals should plan a mid-term deliverable consisting in the assessment of the project's mid-term outcomes, performed by the practitioners involved in the project.

HORIZON-CL3-2025-01-BM-03: Open topic on better customs and supply chain security

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 9.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 2 Customs Authorities from at least 2 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the</p>

	<p>Research and Training Programme of the European Atomic Energy Community (2021-2025).⁴².</p> <p>Beneficiaries must provide financial support to third parties in the form of grants. The maximum amount to be granted to each third party is EUR 100 000 to support the expected outcomes of the topic and effective collaboration and/or coordination with additional relevant national Customs Authorities, including testing and validation activities within the projects.</p>
<i>Security Sensitive Topics</i>	<p>Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.</p>

Expected Outcome: Project results are expected to contribute to the following expected outcome(s):

- Improved customs and supply chain security through better prevention, detection, deterrence, anti-tampering and/or fight of illegal activities involving flows of goods across EU external borders and through the supply chain, and/or through better interoperability, minimising disruption to trade flows.

Scope: Under this topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions for improving capabilities of practitioners for the security of customs and the supply chain. Contexts and scenarios in Europe's border regions that may in the future be impacted by geopolitical instabilities, tensions from outside the EU or impact on the environment, and need sustained and improved surveillance and reaction capabilities, could be particularly considered. If they relate to some of the topics covered by Horizon Europe Calls Effective Management of EU External Borders 2021-2022 or 2023-2024, the proposals should convincingly explain how they will build on and not duplicate them.

Proposals may also address capabilities related to possible future detection of threats in the flow of goods and/or in the supply chain in a flexible, rapid, relocatable way. Detection capabilities could target one or more type(s) of dangerous, illicit and/or illegal goods or materials, including illicit drugs and their precursors, illegally traded species covered by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) considering the European Deforestation Free Products Regulation, contraband, chemical, biological, radiological, nuclear and explosive (CBRN-E) threats and/or various modi operandi related to cross-border trafficking, including involving cargo.

⁴² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Projects should integrate aspects of:

- perspectives of safeguarding and promoting human rights, developing solutions that contribute to those safeguarding and promotion;
- inputs from human rights, law and ethical perspectives, as well as the consideration and views of individuals and society, as appropriate; proposals can engage with citizens and civil society for wider input and support;
- aspects of cybersecurity of the technology proposed, and the protection of communication systems and networks involved in the solutions, if and as relevant.

Proposals that include solutions and/or methods that would contribute to a lower environmental impact and footprint, better cost-efficiency, better energy-efficiency, and/or better operational autonomy of the capabilities and solutions in this topic, would be welcome.

Depending on the particular scope of the proposal, participation of Police Authorities, Border and/or Coast Guards is welcome.

To ensure the active involvement of and timely feedback from relevant security practitioners, proposals should plan a mid-term deliverable consisting in the assessment of the project's mid-term outcomes, performed by the practitioners involved in the project.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Proposals should plan their activities opting for the financial support to third parties in order to provide financial support to additional (i.e., beyond those partners in the Consortium) practitioners (i.e., authorities with competences of Customs) to engage during the project for additional piloting, testing and/or validation of technologies or methods. From 5% up to 20% of the EU funding requested by the proposal may be allocated to the purpose of financial support to third parties.

Proposals must clearly describe the objectives and the expected results to be obtained, including the elements listed in the application template. Proposals are also expected to describe the methods and processes relevant to comply with the general eligibility conditions for financial support to third parties set out in General Annex B and to demonstrate effectiveness (impact).

Destination - Resilient Infrastructure

As stated in the Horizon Europe strategic plan 2025-2027, proposals submitted under this Destination should aim to contribute to “[...] resilience of large-scale interconnected systems’ infrastructures and the bodies that operate them in case of complex attacks, pandemics, natural and human-made disasters, or the impacts of climate change[...]”.

This destination will support the implementation of the European Commission political guidelines 2024-2029 for a ‘Safer and more secure Europe’ and ‘Preparedness Union’, while protecting democracy and putting research and innovation at the heart of a resilient economy. Overall, research under this Cluster should continue to focus on preserving and securing citizens’ basic right to feel safe. This destination will support the European Commission efforts towards:

- improving cyber capabilities, coordinating national cyber efforts and securing our critical infrastructures.
- the development of a new European Critical Communication System.
- building climate resilience and preparedness of infrastructure in sectors like energy, water or food, and informing the new European Water Resilience Strategy.

To this end, these proposals should contribute to the achievement of one or more of the following impacts:

- address both physical and digital aspects of critical infrastructure security, including specific challenges for cybersecurity, and
- support development of upgraded systems, and the interoperability of existing systems, for operators’ resilience and the protection of critical infrastructure to enable a rapid, effective, safe and secure response and recovery, as also situational awareness and information sharing, without significant human involvement, to complex threats and challenges while also supporting emergency responders where their intervention is needed;
- security by design is a default feature of both newly created and upgraded infrastructures;
- improve cross-sectoral cooperation, as well as risk assessments to ensure the resilience and open strategic autonomy of European infrastructures.

More specifically, having in mind the fast pace of technological developments, growing dependencies of modern democratic societies, public administration and economies from critical infrastructure, as well as ongoing hybrid threats, and the impacts of climate change, diverse swiftly advancing challenges that European society faces merit dedicated research and innovation actions in the scope of this Destination. Some of these specific challenges are:

- mapping of critical infrastructure interdependencies leading to early threat identification and warning systems, mitigation plans and recovery procedures;
- supply chains of critical infrastructure;
- risk of unmanned platforms attacks on critical infrastructure;
- effective perimeter protection (e.g.: physical barriers, surveillance systems, access control, or cybersecurity measures) and monitoring including large area spanning infrastructure elements;
- new threats and hazards arising from climate change and/or the green transition, including widespread use of renewable energy sources;
- implementation of post-disaster recovery lessons to manage future exposure and vulnerability;
- lack of standards and advanced tools to conduct virtual and physical stress tests (sectoral and cross sectoral).

This destination will continue to support the policy objectives of the directives on the resilience of critical entities (CER Directive⁴³ and on network and information security (NIS2 Directive⁴⁴). Further, submitted proposals should consider policy developments and meet some of the expectations stemming from the following EU legislation and policy documents, whichever would be relevant to the challenges addressed by the proposal:

- Security Union Strategy⁴⁵;
- EU Counter-Terrorism Agenda⁴⁶;
- EU Cybersecurity Strategy⁴⁷;
- NIS2 Directive⁴⁸;
- CER Directive⁴⁹;
- EU Adaptation Strategy⁵⁰;
- EU Maritime Security Strategy⁵¹;
- EU Aviation Security Strategy⁵²;

⁴³ Directive (EU) 2022/2557.

⁴⁴ Directive (EU) 2022/2555.

⁴⁵ COM (2020) 605 final.

⁴⁶ COM (2020) 795 final.

⁴⁷ JOIN (2020) 18 final.

⁴⁸ Directive (EU) 2022/2555.

⁴⁹ Directive (EU) 2022/2557.

⁵⁰ COM (2021) 82 final.

⁵¹ Council of the EU 11205/14 JOIN(2023) 8 final.

- Europe-wide Climate Risk assessment (EUCRA) and Commission Communication on Managing Climate Risks⁵³;
- Joint Framework on Countering Hybrid Threats⁵⁴ and the Joint Communication on Increasing Resilience and Bolstering Capabilities to Address Hybrid Threats⁵⁵;
- EU C-UAS Strategy⁵⁶;
- EU Space Strategy for Security and Defence⁵⁷;
- EU Disaster Resilience Goals⁵⁸;
- EU Cable Security Action Plan⁵⁹.

Plans to build on elements of relevant predecessor projects should be considered, where relevant. It will be important also to take into account how research results can be advanced to deployable solutions after the projects lifetime, utilising validation and capacity-building programmes like the Internal Security Fund, or Digital Europe Programme.

Where possible and meaningful, synergy-building and clustering initiatives with successful actions in the same, or other relevant areas. should be considered, including the organisation of international events in coordination with the Community for European Research and Innovation for Security (CERIS)⁶⁰.

Proposals are invited against the following topic(s):

HORIZON-CL3-2025-01-INFRA-01: Open topic for improved preparedness for, response to and recovery from large-scale disruptions of critical infrastructures

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

⁵⁹ JOIN(2025) 9 final

⁶⁰ https://home-affairs.ec.europa.eu/networks/ceris-community-european-research-and-innovation-security_en

<i>Indicative budget</i>	The total indicative budget for the topic is EUR 15.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p> <p>The following additional eligibility conditions apply:</p> <p>This topic requires involvement as beneficiaries of at least 3 relevant practitioners from at least 3 different EU Member States or Associated Countries. Depending on the specific proposal submitted, these practitioners should represent one or several of the following portfolios:</p> <ul style="list-style-type: none"> • critical infrastructure operator, • authority responsible for critical infrastructure resilience, • civil protection authority, • law enforcement or private companies delivering security for critical infrastructure. <p>The scale of operation of the above practitioners (national, regional or local) should match the proposal objectives.</p> <p>For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all requested information.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries must provide financial support to third parties in the form of grants. The maximum amount to be granted to each third party is EUR 200 000 to support the expected outcomes of the topic and engagement with SMEs and/or effective collaboration and/or coordination with additional relevant critical infrastructure operator, government authority responsible for critical infrastructure resilience, national authority responsible for overseeing critical infrastructure</p>

	operators, or civil protection authority from EU Member States or Associated Countries. These additional partners involvement must include testing and validation activities in the operational environment.
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: Projects' results are expected to contribute to some or all of the following outcomes:

- Critical infrastructure is more resilient to natural hazards, intentional and accidental harmful human actions, including cyberattacks;
- Critical infrastructure operators and authorities have better mapping of the interdependencies relevant for the addressed sector(s) also in view of better managing potential multi-hazard, cross-sectorial and cross border crisis;
- Critical infrastructure operators and authorities have access to improved monitoring, risk and threat assessment, forecast, and if applicable modelling tools as well as cyber- and physical security solutions;
- Critical infrastructure operators and authorities have access to increased post-incident investigation capabilities contributing to better crisis prevention, preparedness, management and response;
- Effective digital tools to conduct virtual and physical stress tests are available for relevant security practitioners;
- Training curricula for critical infrastructure operators, authorities and/or first responders are developed.

Scope: Under this open topic, proposals are invited to address new challenges, and/or develop innovative solutions to existing challenges in order to increase the resilience of critical infrastructure. Proposals should primarily address sector(s) and/or interdependencies that are not covered, in particular by the past Horizon Europe calls: Resilient Infrastructure 2023 and Resilient Infrastructure 2024. If they relate to some of the topics covered by Horizon Europe Calls Resilient Infrastructure 2021-2022, the proposals should convincingly explain how they will build on their outcomes and not duplicate them.

Adapted to the nature, scope and type of proposed activities, proposals should convincingly explain how they will plan and/or carry out demonstrations, testing or validation of developed tools and solutions. Proposals should also outline the plans to develop possible future uptake and upscaling at regional, national and/or EU level.

To ensure the active involvement of and timely feedback from relevant security practitioners, proposals should plan a mid-term deliverable consisting in the assessment, performed by the practitioners involved in the project, of the project's mid-term outcomes.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Proposals should plan their activities opting for the financial support to third parties in order to provide financial support to practitioners (critical infrastructure operator, government authority responsible for infrastructure resilience, national authority responsible for overseeing critical infrastructure operators, or civil protection authority) for expanding the proposed work in terms of additional user groups, complementary assessments, technology- or methodology-testing activities and/or to SMEs as additional solution providers. From 10% up to 30% of the EU funding requested by the proposal may be allocated to the purpose of financial support to third parties.

Proposals must clearly describe the objectives and the expected results to be obtained, including the elements listed in the application template. Proposals are also expected to describe the methods and processes relevant to comply with the general eligibility conditions for financial support to third parties set out in General Annex B and to demonstrate effectiveness (impact).

Coordination among the successful proposals from this topic should be envisaged in order to avoid duplication, exploit complementarities, and use opportunities for increased impact. Similarly, coordination with projects funded under HORIZON-CL3-2025-INFRA-01-02: Open topic for role of the human factor for resilience of European critical entities.

HORIZON-CL3-2025-01-INFRA-02: Open topic for role of the human factor for the resilience of critical infrastructures

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 7.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection</p>

	<p>of European communication networks.</p> <p>The following additional eligibility conditions apply:</p> <p>This topic requires involvement as beneficiaries of at least 3 relevant practitioners from at least 3 different EU Member States or Associated Countries. Depending on the specific proposal submitted, these practitioners should represent one or several of the following portfolios:</p> <ul style="list-style-type: none"> • critical infrastructure operator, • national or regional authority responsible for critical infrastructure resilience, • civil protection authority, • law enforcement or private companies delivering security for critical infrastructure. <p>For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all requested information.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5 by the end of the project – see General Annex B.
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: Projects’ results are expected to contribute to some or all of the following outcomes:

- Critical infrastructure is more resilient to natural hazards, intentional and accidental harmful human actions, including cyber attacks;
- Infrastructure operators and authorities have better understanding of human factor for the critical entities resilience;
- Infrastructure operators and authorities have access to improved risk and threat assessment, and forecast;
- Infrastructure operators and authorities have access to increased post-incident investigation capabilities contributing to better crisis prevention;

- Insider threats are effectively tackled, including through innovative, cost-efficient systems for background checks that are in full compliance with privacy;
- Training curricula for infrastructure operators, authorities and/or first responders are developed.

Scope: Under this open topic, proposals are invited to address new challenges, and/or develop innovative solutions or strengthen capabilities to tackle existing challenges taking into account the human factor, for the benefit of resilience of critical infrastructures. The emphasis of the proposals should be on the human dependant abilities of critical infrastructure to cope with an adverse event, including their capacity to prepare for the crisis, absorb the impact, reduce the recovery time, and adapt by reducing future exposure and vulnerabilities.

To ensure the active involvement of, and timely feedback from relevant security practitioners, proposals should plan a mid-term deliverable consisting in the assessment, performed by the practitioners involved in the project, of the project's mid-term outcomes.

Activities proposed within this topic should address both technological and societal dimensions of the tackled challenge in a balanced way. This topic requires the effective contribution of SSH disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of related research and innovation activities.

Coordination among the successful proposals from this topic should be envisaged in order to avoid duplication, exploit complementarities, and use opportunities for increased impact. Similarly, coordination with projects funded under HORIZON-CL3-2025-INFRA-01-01: Open topic for improved preparedness for, response to and recovery from large-scale disruptions of European infrastructure.

Destination - Increased Cybersecurity

The strategic plan 2025-2027 identifies the following impact: *"Increased cybersecurity and a more secure online environment by developing and using effectively EU and Member States' capabilities in digital technologies supporting protection of data and networks aspiring to technological sovereignty in this field, while respecting privacy and other fundamental rights; this should contribute to secure services, processes and products, as well as to robust digital infrastructures capable to resist and counter cyber-attacks and hybrid threats".*

Under this Work Programme, the Commission intends to conclude a contribution agreement entrusting the European Cybersecurity Competence Centre (ECCC) with the implementation of call topics related to Increased Cybersecurity. Please refer to "Indirectly managed action by the ECCC" in the section "Other Actions" of this Work Programme part – including the Appendix providing the call specifications for information purposes. Those specifications incorporate 'expected impacts' set out below.

Expected impacts:

- Support the EU's technological capabilities by investing in cybersecurity research and innovation to further strengthen its leadership, strategic autonomy, digital sovereignty and resilience;
- Help protect its infrastructures and improve its ability to prevent, protect against, respond to, resist, mitigate, absorb, accommodate and recover from cyber and hybrid incidents, especially given the current context of geopolitical change;
- Support European competitiveness in cybersecurity and European strategic autonomy, by protecting EU products and digital supply chains, as well as critical EU services and infrastructures (both physical and digital) to ensure their robustness and continuity in the face of severe disruptions;
- Encourage the development of the European Cybersecurity Competence Community;
- Particular attention will be given to SMEs, who play a crucial role in the cybersecurity ecosystem and in overall EU digital single market competitiveness, by promoting security and privacy 'by design' in existing and emerging technologies.

Destination - Disaster-Resilient Society for Europe

Given the increasing frequency and ever greater impacts of disasters resulting from climate extremes, natural, geohazards and human-made hazards, the EU needs to invest more in improving disaster risk management, tools for first responders and societal resilience. In this respect, along the orientations given in the Horizon Europe strategic plan 2025-2027, the main objectives of this destination supporting the *reduction of losses from natural, accidental and human-made disasters* will be pursued in continuity with the strategic plan 2021-2024.

This destination will support the implementation of the European Commission political guidelines 2024-2029 for a ‘Safer and more secure Europe’, a ‘Preparedness Union’, with ‘Stronger Common Borders’, protecting democracy and putting research and innovation at the heart of a resilient economy. Overall, research under this Cluster should continue to focus on preserving and securing citizens’ basic right to feel safe. This destination will support the European Commission efforts towards:

- enhancing efforts to prevent and prepare for new threats, especially those linked to chemical, biological, radiological and nuclear (CBRN) security.
- continuing to address risks to security from climate change impact / step up work on climate resilience and preparedness.
- supporting medical countermeasures against public health threats.

Moreover, this destination will support the implementation of UN Disaster Risk Reduction policies, the EU Disaster Resilience Goals⁶¹ involving closer coordination with the Union Civil Protection Knowledge Network, the rescEU initiative and Member States’ civil protection authorities, as well as an enhanced dialogue at international level with the United Nations Office for Disaster Risk Reduction (UNDRR) on recommendations for the Sendai Framework⁶² and United Nations Sustainable Development Goals (SDGs). Such closer coordination with other programmes will make it possible to further streamline future research programming. For example, Cluster 3 should focus on its core added value, which is a strong operational character for preparedness, response and learning, while maintaining complementarities with broader prevention issues such as climate-related risks, covered by Cluster 5, and the Mission on Climate Change Adaptation. There are similar examples in closer coordination with Cluster 6 and the One Health approach, regarding, for instance, water and food security threats (as a result of intentional degradation or terrorist acts).

From a technological perspective, the Destination will ensure greater involvement of practitioners in close cooperation with the Member States and EU agencies, not only in research development and implementation, but also the identification of gaps and needs and future research topics. Actions to develop tools and technologies to meet operational capability needs should be aimed at higher technological readiness levels (TRLs). Synergies with existing infrastructures and initiatives, such as Destination Earth for extreme-weather

⁶¹ (2023/C 56/01); COM (2023) 61 final.

⁶² UNDRR, Sendai Framework for Disaster Risk Reduction 2015-2030

events, are encouraged in addressing natural disasters. Finally, it will be important to take into account how research results, both those still to come and those already developed in past projects under the DRS destination, can be turned into deployable solutions by being combined with capacity-building programmes (in particular the Internal Security Fund, funding under the Union Civil Protection Mechanism⁶³ the European Regional Development Fund, and the Cohesion Fund) and social innovation to support the entry into the market of developed technologies. Actions will also aim to ensure that there is a link between R&I and possible procurement (e.g., in the area of medical countermeasures).

Proposals for topics under this Destination should have the overarching objective of improving resilience. Actions will continue to explore initiatives and experiments involving the development of technological or methodological solutions for crisis management and support for emergency responders, getting the general public more involved in this area and improving interactions between regional and/or local authorities, public practitioners, private operators and civil society. Actions could also take into consideration regions vulnerable to extreme weather events in coastal areas, sea level rise and other climate change impacts, which may be prone to disaster risks (e.g. the Arctic). New tools or solutions should build on what has been developed in past projects and be capable of being integrated into existing (legacy) systems. Actions will also focus on multi-service capability developments, in particular tools and technologies to support direct operational needs in case of a disaster. This will be done in a scalable way, covering areas from small rural towns to economically developed ones with a high population density, and opening research initiatives to international cooperation. Capabilities need to be upgraded to match the new resilience stakes and expectations of practitioners and of society as a whole. We should learn from past disaster events by identifying gaps in capabilities that the response to such events showed were lacking. For example, one of such gaps are the availability of medical countermeasures used to effectively respond to deliberate or accidental releases of CBRN substances.

The destination will continue to follow a multi-hazard approach, addressing disasters and threats of all kinds, including their cascading issues, climate-related or natural and geological hazards, industrial accidents, pandemics, intentional hostile acts including terrorism and armed conflict. Particular attention will be paid to floods and wildfires, as well as to chemical, biological, radiological, nuclear and explosive (CBRN-E) threats. To this end, proposals should contribute to the achievement of one or more of the following impacts:

- Enhanced citizen and regional and/or local authorities' involvement in research actions, and in operational measures that may result from research, with focus on risk awareness and enhanced disaster prevention and preparedness, including youth awareness raising and education;
- Improved disaster risk governance (from prevention, preparedness to mitigation, response, deployment of countermeasures and recovery, using updated risk assessment

⁶³ See the UCPM scientific needs assessment on disaster risk management: <https://civil-protection-knowledge-network.europa.eu/media/outcome-report-scientific-research-needs-exercise>.

methods and decision criteria, and including knowledge transfer and awareness of innovative solutions) from international to regional and/or local levels;

- Strengthened capacities of first responders in all operational phases related to any kind of (natural and human-made, including hybrid threats) disasters in support of field operations with validation of tools and technologies used in disaster responses including emergencies, and demonstration of their interoperability.

More precisely, in the context of exacerbated impacts of various disaster threats on vulnerable societies, research and innovation actions are highly needed to face the many challenges faced by European Society. Some of them are:

- Challenges related to inclusion of the general public, regional and/or local communities and voluntary organisations as active partners in order to:
 - o empower citizens to act and help them to improve their disaster risk awareness and own resilience to crises, including accountability for regional and/or local administrative decisions on residual risks, youth awareness raising and education;
 - o provide means for regional and/or local decision-makers and operational responders, i.e., first and second responders. A “second responder” is a worker who supports “first responders” such as police, fire, and emergency medical personnel. They are involved in preparing, managing, returning services, and cleaning up sites during and after an event requiring first responders, including crime scenes and areas damaged by fire, storm, wind, floods, earthquakes, or other natural disasters. These types of services may include utility services (shutdown or reinstatement of electrical, gas, sewage, and/or water services), wireless or wireline communication services, specialty construction (i.e. shelter construction), hazardous waste clean-up, road clearing, crowd control, emergency services (i.e. Red Cross⁶⁴), first aid, food services, security services, social services (i.e., trauma counsellors), and sanitation, infrastructure owners, regional and/or local authorities (including public services, transport and utilities) to coordinate prevention and preparedness actions, bearing in mind the socio-economic and cultural context, and for operational responders to influence regional and/or local planning decisions that affect exposures and vulnerability to risks in short and long term;
 - o address citizens’ perception of, and involvement in, civil defence in the event of very large-scale disasters including armed conflict.
- Challenges regarding the reinforcement of disaster risk governance and the consideration of knowledge and innovative solutions in order to:
 - o improve operational management of crises at different levels (prevention, preparedness, response, recovery) and scales (international to regional and/or local),

⁶⁴ <https://redcross.eu>

- o reinforce the uptake and transfer of knowledge to risk managers, first and second responders and decision-makers;
- o strengthen resilience and enhancing protection strategies for emergency services and healthcare workers in case of disasters;
- o reinforce civil defence capability, looking at all facets of crisis and disaster management, alongside community resilience building;
- o enhance preparedness for optimised detection, prevention, response and control measures in case of bioterrorism or emerging diseases.
- Challenges related to the validation and usability of tools and technologies, including the demonstration of their interoperability, in the context of strengthened first responder's capacities as to:
 - o enhance risk awareness, preparedness and communication about foreseeable impacts of disasters;
 - o deploy innovative solutions in emergency situations including trusted communication channels, medical care, medical countermeasures, support equipment (e.g. detectors), triage of victims as well as protection of first responders;
 - o enhance validation of tools, technologies and processes for cross-border prevention, decision-support and responses to climate-related and geological disasters and emergency crises by different practitioner sectors (firefighters, medical emergency services, civil protection, police, NGOs);
 - o enhance interoperability of tools and technologies used in international emergency (real-case) situations related to natural hazards, CBRN-E threats and hybrid threats via inputs such as standard operating procedures for foresight, risk analysis or guidance with the aim to improve market uptake.

This Destination will also support, whenever appropriate and applicable, the proposals with some or all of the following goals:

- a clear strategy from international to regional and/or local on how the overall society will adapt to the evolving disaster risks based on the subsidiarity principle (from the citizen level to international decision-making);
- the involvement of different responders (firefighters, civil protection, medical emergency, police) and regional and/or local authorities in research, development and validation of methods and tools;
- the active role for Non-Governmental Organisations (NGOs) and Civil Society Organisations (CSOs);

- the active involvement of Small and Medium Enterprises (SMEs);
- a robust plan on how they will build on the relevant predecessor projects, and clustering with existing research (EU and national) actions to maximise complementarities and synergies and avoid duplication of efforts;
- education and training aspects for first and second responders for different types of threats (climate-related, geohazards, accidental, intentional), as well as information sharing and awareness raising of the citizens;
- a clear strategy on the uptake of the outcomes, defined in consultation with the involved stakeholders;
- a well-developed plan both on how research data for training and testing will be obtained, in order to reach the requested Technology Readiness Levels (TRLs), and on how the specific TRL will be measured.

Where possible and relevant, synergy-building and clustering initiatives with successful proposals in the same area should be considered, including the organisation of international conferences in close coordination with the Community for European Research and Innovation for Security (CERIS)⁶⁵ activities and/or other international events.

Proposals are invited against the following topic(s):

HORIZON-CL3-2025-01-DRS-01: Open topic on citizen and regional and/or local authorities' engagement in enhanced disaster risk awareness, including education, and preparedness

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 12.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: The following exceptions apply: subject to restrictions for the protection of European communication networks.

⁶⁵ https://home-affairs.ec.europa.eu/networks/ceris-community-european-research-and-innovation-security_en

	<p>The following additional eligibility conditions apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 2 Regional and/or Local Authorities, at least 2 organisations representing citizens or regional and/or local communities⁶⁶ and 2 First responders or disaster management authorities⁶⁷ from at least 3 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio, grants will be awarded to applications not only in order of ranking but at least also to one project that is the highest ranked within each of the two options given in the scope (Option a and Option b), provided that the applications attain all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁶⁸.</p>

Expected Outcome: Project results are expected to contribute to one or both of the following expected outcomes:

- Improved disaster preparedness, learning from past disasters or crises, and better sharing of knowledge on lessons learned and risk awareness to citizens and regional and/or local

⁶⁶ A Citizen Organisation can be a Non-Governmental Organisation representing citizens interests in the area of civil protection and/or associations of volunteers.

⁶⁷ As an example, contacts of national UCPM authorities are available here: https://civil-protection-humanitarian-aid.ec.europa.eu/what/civil-protection/national-disaster-management-system_en

⁶⁸ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

authorities, understanding what countermeasures were taken in previous incidents and exploring currently available products to improve future outcomes;

- Reinforced dialogue and cooperation among scientific and technical communities, stakeholders, policy-makers and regional and/or local communities in disaster risk reduction for an enhanced uptake of research outputs.

Scope: Societal resilience and preparedness to disasters are shaped by the way authorities and citizens exchange, access, understand, and react to information about hazards. As a result, anyone may become more vulnerable if barriers to these processes occur. Strengthening societal resilience to disasters, therefore, requires investment by authorities at operational, strategic, and policy levels to improve engagement with citizens and integrate inclusive communication processes. In order to achieve this, it is important to take into account the diversity of citizens, be it relating to age, gender, educational levels, disability, and other social characteristics.

The European Commission is developing and implementing an EU Preparedness Union Strategy following whole-of-government and whole-of-society approaches. The EU's disaster resilience goal No. 2 is "Prepare – Increasing risk awareness and preparedness of the population"⁶⁹. The proposals' outcomes should especially work towards supporting these two policies and follow the recommendations of the Directorate-General for European Civil Protection and Humanitarian Aid Operations (DG ECHO) to ensure a successful uptake to the end users. Proposals are invited to utilise the Special Eurobarometer on "Disaster risk awareness and preparedness of the EU population"⁷⁰ as evidence of needs.

Under the open topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions and technology, including the use of AI, for improving disaster preparedness, risk awareness by citizens and regional and/or local authorities, and for reinforcing the cooperation among scientific / technical communities and policy-makers / regional and/or local authorities for an enhanced sharing of knowledge and uptake of research outputs. If they relate to some of the topics covered by Horizon Europe Calls Disaster-Resilient Society 2021-2022 or 2023-2024, the proposals should convincingly explain how they will build on and not duplicate them.

Proposals are expected to address one of the following options:

Option a: Tools and solutions to improve disaster preparedness and risk awareness by citizens and regional and/or local authorities;

Option b: Mechanism to enhance dialogue among research/academic communities, practitioners and regional and/or local authorities for sharing knowledge and effectively uptake research results.

⁶⁹ (2023/C 56/01); COM (2023) 61 final.

⁷⁰ <https://europa.eu/eurobarometer/surveys/detail/3228>

Adapted to the nature, scope and type of proposed projects, proposals should convincingly explain how they will plan and/or carry out demonstration, testing or validation of developed tools and solutions. Furthermore, proposals should outline the plans to develop possible future uptake and upscaling at national and EU level for possible next steps once the project is finalised. Proposals should also consider, build on if appropriate and not duplicate previous research, including but not limited to research by other Framework Programmes' projects. Coordination among the successful proposals from this topic should be envisaged in order to avoid duplication and to exploit complementarities as well as opportunities for increased impact.

Proposals funded under this topic are expected to engage with citizen organisations, regional and/or local authorities and practitioners (first and second responders/civil protection agencies/disaster management authorities), private sector operators during the lifetime of the project, including validating the outcomes, with the aim of facilitating future uptake of innovations for the Disaster Risk Reduction community.

This topic requires the effective contribution of SSH disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of related research and innovation activities.

HORIZON-CL3-2025-01-DRS-02: Open topic on Improving disaster risk management and governance to ensure self-sufficiency and sustainability of operations in support of enhanced resilience

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>Due to the scope of this topic, legal entities established in LAC (Latin America/African/Caribbean) as well as Central Asian Countries⁷¹ are exceptionally eligible for Union funding.</p> <p>The following additional eligibility conditions apply:</p>

⁷¹ https://home-affairs.ec.europa.eu/policies/international-affairs/collaboration-countries/central-asia_en

	<p>This topic requires the active involvement, as beneficiaries, of at least 2 Regional and/or Local Authorities, 1 disaster management authority⁷² and 1 Volunteers Organisation from at least 3 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio, grants will be awarded to applications not only in order of ranking but at least also to one project that is the highest ranked within each of the two options given in the scope (Option a and Option b), provided that the applications attain all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁷³.</p>

Expected Outcome: Project results are expected to contribute to the following expected outcome(s):

- Better understanding of the impact of disasters and crises, and improved early warnings and long-term planning linked to natural causes or to human-made threats (including CBRN) on risk governance, including emergency services, regional and/or local authorities, and citizen volunteers, and improved adaptation and resilience of emergency systems for disaster prevention and preparedness – especially in a multi-risk environment with cascading disasters.

⁷² As an example, contacts of national UCPM authorities are available here: https://civil-protection-humanitarian-aid.ec.europa.eu/what/civil-protection/national-disaster-management-system_en

⁷³ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: Improved risk governance, adaptation and resilience requires authorities and communities to adopt risk and resilience management approaches, which are inclusive and innovative, through pre-defined plans and procedures, as well as through adaptable and flexible capabilities to prepare for, respond to, recover from and learn from disasters and crises. It requires the implementation of policies at different levels (international to regional and/or local) and strategies for a better understanding of impacts and enhanced risk preparedness and adaptation, which are co-developed and enabled through *all-of-society* engagement and participation, and hence strengthen resilience to disasters among authorities, decision-makers, private actors, intermediary actors, volunteers and citizens, and the most vulnerable.

The European Commission is developing and implementing an EU Preparedness Union Strategy⁷⁴ following whole-of-government and whole-of-society approaches. The proposals' outcomes should especially work towards supporting the Strategy and follow the recommendations of the Directorate-General for European Civil Protection and Humanitarian Aid Operations (DG ECHO) to ensure a successful uptake to the end users.

Under the open topic, proposals are welcome to address new, upcoming or unforeseen challenges and/or creative or disruptive solutions for an enhanced understanding of impacts of disasters and crises linked to natural or human-made causes on risk governance and improved resilience of emergency systems, that are not covered by topics of Horizon Europe Calls Disaster-Resilient Society 2023-2024. If they related to some of the topics covered by Horizon Europe Calls Disaster-Resilient Society 2021-2022, the proposals should convincingly explain how they will build on and not duplicate them.

Proposals are expected to address one of the following options:

Option a: Enhanced impact forecasting and early warning systems, understanding of climate / weather extreme events and geohazards and adaptation of emergency systems for disaster prevention and preparedness;

Option b: Enhanced impact forecasting and understanding of Chemical, Biological, Radiological, Nuclear, Explosive (CBRN-E) threats and adaptation of emergency systems for disaster prevention preparedness and response (including medical countermeasures). Projects do not need to address all elements of CBRN-E.

Adapted to the nature, scope and type of proposed projects, proposals should also convincingly explain how they will plan and/or carry out demonstration, testing or validation of developed tools and solutions. Furthermore, proposals should outline the plans to develop possible future uptake and upscaling at national and EU level for possible next steps once the project is finalised. Proposals should also consider, build on if appropriate and not duplicate previous research, including but not limited to research by other Framework Programmes' projects. Coordination among the successful proposals from this topic should be envisaged in

⁷⁴ Europe's choice – Political guidelines for the next European Commission 2024-2029, p. 14.

order to avoid duplication and to exploit complementarities as well as opportunities for increased impact.

Proposals funded under this topic are expected to engage beyond the project consortium with volunteers' organisations, regional and/or local authorities and disaster management authorities during the lifetime of the project, including validating the outcomes, with the aim of facilitating future uptake of innovations for the Disaster Risk Reduction community.

To ensure the active involvement of and timely feedback from relevant practitioners, i.e., emergency responders (with expertise in the different types of natural or human-made threats), proposals should plan a mid-term deliverable consisting in the assessment, performed by the practitioners involved in the project, of the project's mid-term outcomes.

Due to the scope of this topic, legal entities established in LAC (Latin America and Caribbean), African, and Central Asian countries are encouraged to participate.

This topic requires the effective contribution of SSH disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of related research and innovation activities.

HORIZON-CL3-2025-01-DRS-03: Open topic on testing / validating tools, technologies and data used in cross-border prevention, preparedness and responses to climate extreme and geological events and chemical, biological or radiological emergency threats

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 4.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 13.50 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p> <p>Due to the scope of this topic, legal entities established in LAC (Latin America/African/Caribbean) as well as Central Asian Countries⁷⁵ are exceptionally eligible for Union funding.</p>

⁷⁵

https://home-affairs.ec.europa.eu/policies/international-affairs/collaboration-countries/central-asia_en

	<p>The following additional eligibility conditions apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least 2 First responders or disaster management authorities⁷⁶ and 2 SMEs from at least 3 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL of 7-8 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio, grants will be awarded to applications not only in order of ranking but at least also to one project that is the highest ranked within each of the options (Option a, Option b and Option c, Option d), provided that the applications attain all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁷⁷</p> <p>Beneficiaries must provide financial support to third parties in the form of grants. The maximum amount to be granted to each third party is EUR 100 000 to support the expected outcomes of the topic and effective collaboration and/or coordination with relevant First Responders covering different disciplines and sectors of intervention, including testing and validation activities within the projects, and/or SMEs from EU Member States or Associated Countries.</p>

⁷⁶ As an example, contacts of national UCPM authorities are available here: https://civil-protection-humanitarian-aid.ec.europa.eu/what/civil-protection/national-disaster-management-system_en

⁷⁷ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.
----------------------------------	---

Expected Outcome: Project results are expected to contribute to the following expected outcome(s):

- Enhanced European and global interoperability of existing tools and technologies and improved capacities to prevent, better prepare and respond to different types of disasters (natural and human-made) by various practitioners (e.g., firefighters, medical responders, civil protection).

Scope: The use of artificial intelligence (AI) and machine-learning (ML) tools is increasingly at the core of first responder's decision-making processes, including situational awareness, analysis and planning. Besides the needs to develop AI and ML tools, ground technologies such as miniaturised sensors that can operate autonomously for a long period in harsh environments and are fast and easy to deploy are needed for threat detection (such as chemical, biological or radiological substances) and/or identification of victims and possible locations for intervention. In addition, responders need to exchange information (language, data, video, etc.) in a reliable, secure, and universal way, while emergency communications throughout the European Union also need to be strengthened⁷⁸. In many instances, interoperability of tools, technologies and communication channels is still an open issue, requiring standard operating procedures, specific education, training and exercises of responders.

The European Commission is developing and implementing an EU Preparedness Union Strategy⁷⁹ following whole-of-government and whole-of-society approaches. The proposals' outcomes should especially work towards supporting the Strategy and follow the recommendations of the Directorate-General for European Civil Protection and Humanitarian Aid Operations (DG ECHO) to ensure a successful uptake to the end users. Under the open topic, proposals are welcome to testing / validate tools, technologies and data used in cross-border prevention, preparedness and responses to climate / geological / accidental fire disasters and chemical, biological or radiological emergency threats (including medical countermeasures) by different practitioner's sectors in view of demonstrating their interoperability in real-case situations, with focus on the use of AI and ML tools, miniaturized sensors for threat detection and victim identification, and communication (including cross-border emergency communications).

Proposals are expected to address one of the following options focused on testing / validation of tools and technologies, and demonstration of their interoperability:

⁷⁸ Critical Communication System (EUCCS). See e.g., Commission White Paper on "How to master Europe's digital infrastructure needs?" (2024).

⁷⁹ Europe's choice – Political guidelines for the next European Commission 2024-2029, p. 14.

Option a: Use of artificial intelligence (AI) / machine learning (ML) tools to support first responder's analysis, planning and decision-making;

Option b: Miniaturized sensors for threat detection and victim identification;

Option c: Information exchange / Communication among first responders in a reliable, secure and universal way, and cross-border emergency communications;

Option d: Alert system to detect CBRN threats, integrating different systems at national, regional and European levels.

Adapted to the nature, scope and type of proposed projects, proposals should also convincingly explain how they will plan and/or carry out demonstration, testing or validation of developed tools and solutions. Furthermore, proposals should outline the plans to develop possible future uptake and upscaling at national and EU level for possible next steps once the project is finalised. Proposals should also consider, build on if appropriate and not duplicate previous research, including but not limited to research by other Framework Programmes' projects. Coordination among the successful proposals from this topic should be envisaged in order to avoid duplication and to exploit complementarities as well as opportunities for increased impact.

Proposals funded under this topic are expected to engage beyond the project consortium with disaster management authorities, Industry/SMEs and Standardisation Organisations during the lifetime of the project, including validating the outcomes, with the aim of facilitating future uptake of innovations for the Disaster Risk Reduction community.

To ensure the active involvement of and timely feedback from relevant practitioners, i.e., First Responders with expertise in the different types of natural or human-made threats, proposals should plan a mid-term deliverable consisting in the assessment, performed by the practitioners involved in the project, of the project's mid-term outcomes.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Proposals that include solutions and/or methods that would contribute to a lower environmental impact and footprint, better cost-efficiency, better energy-efficiency, and/or better operational autonomy of the capabilities and solutions in this topic, would be welcome.

Proposals should plan their activities opting for the Financial Support to Third Parties in order to provide financial support to practitioners (first responders / disaster management authorities) for expanding the proposed work in terms of additional user groups, complementary assessments, technology- or methodology-testing activities and/or to SMEs as additional solution providers. From 5% up to 20% of the EU funding requested by the proposal may be allocated to the purpose of financial support to third parties.

Proposals must clearly describe the objectives and the expected results to be obtained, including the elements listed in the application template. Proposals are also expected to describe the methods and processes relevant to comply with the general eligibility conditions for financial support to third parties set out in General Annex B and to demonstrate effectiveness (impact).

Due to the scope of this topic, legal entities established in LAC (Latin America and Caribbean), African, and Central Asian countries are encouraged to participate.

This topic requires the effective contribution of SSH disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of related research and innovation activities.

HORIZON-CL3-2025-01-DRS-04: Advancing autonomous systems and robotics for high-risk disaster response, strengthening disaster resilience in conflict-afflicted crisis zones

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the active involvement, as beneficiaries, of at least three first responders' organisations or agencies from at least three different EU Member States or Associated Countries, including Ukraine.</p> <p>For these participants, applicants must fill in the table "Information about security practitioners" in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>The participation of at least one entity from Ukraine in the consortium is mandatory.</p> <p>If projects use satellite-based earth observation, positioning, navigation</p>

	and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-8 by the end of the project – see General Annex B.

Expected Outcome: Projects' results are expected to contribute to some or all of the following outcomes:

- To develop and/or adapt a Multi-Function Autonomous Systems for High-Risk Scenarios, which can navigate the unique challenges posed by conflict-driven disasters, such as unstable structures and heavily obstructed urban environments. This system will perform or support civilian tasks like search and rescue, hazard assessment, and supply transport in areas too dangerous for human responders;
- Enhanced remote sensing and situational awareness, creating sensor-based technologies that improve situational awareness for first responders and decision-makers, enabling them to assess disaster zones remotely and safely;
- Autonomous navigation and search capabilities in dangerous environments focusing on technologies that enhance the ability of autonomous systems to perform search operations in low-visibility or smoky conditions, typical of areas impacted by bombings, fires, or other conflict-related incidents;
- User-centred and real-world testing in environments that replicate the conditions of conflict zones and urban disasters;
- Capacity building and training for autonomous system deployment providing specialised training guidelines for first responders and civil protection agencies to operate and maintain autonomous systems effectively in conflict scenarios.

Scope: Conflicts such as the Russian war against Ukraine and the overall geopolitical context marked by tensions and conflicts make it more pressing than ever to ensure that responders are equipped with advanced tools that not only enhance their capabilities, but also protect their lives and increase operational efficiency in extreme environments. These crises demand a new level of preparedness and resilience, where autonomous systems using cutting-edge technologies work in unison to support swift, coordinated, and safe responses.

In light of the ongoing conflicts and the complex, high-risk environments they present, this topic focuses on developing and deploying advanced autonomous systems specifically tailored for large-scale, multi-dimensional disasters and tailored to the challenges of conflict driven. These disasters, exacerbated by geopolitical conflict, severe infrastructure damage, and immediate safety threats to both civilians and responders, demand innovative and resilient solutions. The topic seeks to address the EU's critical need for tools that protect infrastructure, services, and populations while enhancing resilience and operational readiness.

Through rigorous real-world testing and capacity-building programs, responders will be trained to integrate and manage these autonomous systems effectively, preparing them for rapid deployment in high-stakes scenarios. The project will focus on delivering innovative, durable, and efficient technological solutions that allow responding effectively to crises similar in complexity and danger in environments similar to the one of the war in Ukraine. By developing tools that address the unique operational and safety challenges posed by such scenarios, this topic will reinforce the EU's preparedness to protect both citizens and first responders, ensuring swift, coordinated responses to complex crises across Europe and beyond.

Within this topic, the European Commission encourages all potential participants to create, where possible, opportunities for the affected persons and entities, in particular researchers and innovators previously active in Ukraine as well as Ukrainian researchers and innovators who are unable to return to Ukraine in the given circumstances.

Destination - Strengthened Security Research and Innovation

Since the Preparatory Action for Security Research⁸⁰ the EU-funded security research and innovation programme has contributed substantially to knowledge and value creation in the field of internal security. The programme has been fundamental to the consolidation of a European security ecosystem, which is better equipped to capitalise on research and innovation outcomes to support the EU security priorities. This Destination aims to contribute to reducing thematic fragmentation, bringing closer together the actors from different security domains, and expanding the market beyond traditional thematic silos. It also creates knowledge and value through research in matters (including technology, but also social sciences and humanities) that are not exclusive of only one security area, but cross-cutting to the whole Cluster.

As underlined in the Horizon Europe strategic plan 2025-2027, proposals for the topics under this Destination *‘should support with cross-cutting actions the expected impacts outlined above [in the Cluster 3 Destinations]. The destination will increase the impact of the work carried out in the EU security Research and Innovation (R&I) ecosystem and contribute to its core values, namely:*

- *a focus on the potential and practical final use of the outcomes of security R&I;*
- *forward-looking planning of EU security capabilities;*
- *the development of security technologies that are socially acceptable, developed in quadruple helix⁸¹ and that have added value for industrialisation, joint procurement, commercialisation, and the acquisition and deployment of successful R&I outcomes;*
- *safeguarding the EU’s open strategic autonomy and technological sovereignty in critical security areas by contributing to a more competitive and resilient EU civil security technology and industrial base;*
- *experimenting with research and innovation programming; and*
- *helping to make the European R&I ecosystem more consistent’.*

Many of the programme outcomes have materialised in relevant scientific findings, maturation of promising technology areas, operational validation of innovative concepts or support to policy implementation. However, a key challenge remains in improving innovation uptake and thus contributing to the development of security capabilities⁸², support of Start-ups

⁸⁰ COM(2004) 72.

⁸¹ Through the interaction of public authorities, academia, industry and the public.

⁸² For the purpose of the work programme, the terms “Capability” should be understood as “the ability to pursue a particular policy priority or achieve a desired operational effect”. The term “capability” is often interchanged with the term “capacity”, but this should be avoided. “Capacity” could refer to an amount or volume of which one organisation could have enough or not. On the other hand, “capability” refers to an ability, an aptitude or a process that can be developed or improved in consonance with the ultimate objective of the organisation.

and Small-Medium Enterprises (SMEs) and deployment of innovation by security practitioners.

The extent to which innovative technologies developed thanks to EU R&I investment are industrialised and commercialised by EU industry, and acquired and deployed by end-users, could reflect the impact achieved with the programme. As explained in the Commission staff working document on Enhancing security through research and innovation⁸³ there are factors inherent to the EU security ecosystem (often attributed to the market) that hinder the full achievement of this impact, such as market fragmentation, cultural barriers, analytical weaknesses, programming weaknesses, ethical, legal and societal considerations or lack of synergies between funding instruments, among others. To that aim, there is a need to create a favourable environment that is designed with the main purpose of increasing the impact of security R&I, which provides the right tools that serve to tackle the factors that hinder innovation uptake.

Therefore, security research and innovation should foster and enhance the development of innovative tools, technologies and capabilities for the benefit of practitioners that can use in their day-to-day work. To this end proposals under this Destination should set out a credible pathway to contributing to the following impacts:

- A more effective and efficient evidence and knowledge-based development of EU civil security capabilities built on a stronger, more systematic and analysis-intensive security research and innovation cycle;
- Increased cooperation between demand and supply market actors, including with actors from other domains, fosters swift industrialisation, commercialisation, adoption and deployment of successful outcomes of security research and reinforces the competitiveness and resilience of EU security technology and industrial base and safeguards the security of supply of EU-products in critical security areas;
- R&I-enabled knowledge and value in cross-cutting matters reduces sector specific bias and breaks thematic silos that impede the proliferation of common security solutions.

The Destination will trigger actions that will help bringing these and other developments closer to the market, thus contributing to the measures facilitating the uptake of innovation. Those actions will help developers (including industry, research organisations and academia) to accelerate product development and improve the valorisation of their research investment. They will also support buyers and users in materialising the uptake of innovation and further develop their security capabilities. The aim is to increase the capacity of EU public procurers to align their requirements with the EU security industrial capacity and to attract innovation and innovators from security and other sectors through common validation strategies, rapid innovation, experimentation and pre-commercial procurement.

⁸³ https://home-affairs.ec.europa.eu/document/download/ff888398-0b0a-4511-9717-ad41beb22314_en?filename=SWD-2021-422_en.PDF

Finally, the Destination will contribute to the development of the tailored analytical capacity required for the adoption of capability-driven approaches aimed at fostering a forward-looking capability-driven approach in security.

Where possible and relevant, synergy-building and clustering initiatives with successful proposals in the same area should be considered, including the organisation of international conferences in close coordination with the Community for European Research and Innovation for Security (CERIS)⁸⁴ activities and/or other international events.

Proposals are invited against the following topic(s):

HORIZON-CL3-2025-01-SSRI-01: National Contact Points (NCPs) in the field of security and cybersecurity fostering the links with National Community building for Safe, Secure and Resilient Societies

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility conditions apply:</p> <p>Applicants must be Horizon Europe national support structures (National Contact Points - NCPs),</p> <p>NCP) responsible for Cluster 3 and officially nominated to the European Commission from an EU Member State or an Associated Country.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant</i>	The rules are described in General Annex G. The following exceptions apply:

⁸⁴ https://home-affairs.ec.europa.eu/networks/ceris-community-european-research-and-innovation-security_en

<i>Agreements</i>	Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of prizes/grants. The maximum amount to be granted to each third party is EUR 60 000.
-------------------	---

Expected Outcome: Project results are expected to contribute to some or all of the following outcomes:

- Improved and professionalised NCP⁸⁵ service of knowledge, experience and skills, consistent across Europe, thereby helping simplify access to Horizon Europe calls, lowering the entry barriers for newcomers, and raising the average quality of proposals submitted;
- Harmonised and improved trans-national cooperation between NCPs, and support of National communities for research and innovation in the area of security that can collect input from practitioners, industrial partners and convey capability needs.; Increased cooperation of NCPs with seamless collaboration of the national initiatives, with the EU initiatives, namely CERIS⁸⁶;
- Periodic and timely evidence-based feedback in support to EU-funded security research programming enabled by a seamless integration of the national, regional and local dimensions of security Research and Innovation into the EU picture;
- A systematic assessment of the needs of the various stakeholders involved in the areas of security and increase the visibility of capability needs, gaps, and technology solutions expressed by national, regional and local communities;
- Improvement of the awareness of EU funding opportunities relevant for civil security research and innovation;
- Improvement of the awareness of innovation-uptake success stories stemming from the participation of national players in EU-funded security research projects;
- Reduced geographical fragmentation of the civil security research and innovation community via the cooperation with the various initiatives of National Communities of security research and innovation with the participation of stakeholders from the security ecosystem, that are set up and running in the different Member States or Associated Countries.

Scope: National Contact Points (NCPs) are support structures that have become an essential component in the implementation of successive Framework Programmes. They provide information and on-the ground advice to potential applicants and beneficiaries, through the

⁸⁵ <https://horizoneuropencpportal.eu/>

⁸⁶ https://home-affairs.ec.europa.eu/networks/ceris-community-european-research-and-innovation-security_en

project life cycle, in their own language, in a manner that would be impossible for the European Commission and its Agencies acting alone.

NCPs can benefit in their work from the sharing of best practices among them. NCPs can also help to give visibility to different perspectives of all Security Research and Innovation (R&I) stakeholders and to break geographical silos by aggregating the knowledge existing in the EU Member States and regions and incorporate it to the European picture. This set-up increases the visibility of the security at EU level and across security areas.

However, the security sector exhibits a remarkable geographic fragmentation, with actors operating at EU level, at national level, at regional level and even at local level. In order to acknowledge the different perspectives of all stakeholders and break geographical silos, there is a need to aggregate the knowledge existing in the Member States and Associated countries and incorporate it to the European picture.

Cooperation with national stakeholders and establishment of stronger links with the Community for European Research and Innovation for Security (CERIS)⁸⁷.

These links should help to have a more comprehensive view of the common EU security needs and solutions, to better capitalise on pan-European cooperation and funding opportunities, and to give visibility to results from EU and other research projects.

Proposals should link NCPs with national communities for research and innovation that exist already or will be established. The idea of this link is to identify capability gaps, solutions to address those gaps, and research needs at local, regional and national level and integrate them in the EU picture in collaboration with CERIS.

In addition, this collaboration will assist NCPs to share research opportunities coming from national research programmes and initiatives with the wider security research community at national level. This will also improve the visibility of the results achieved by national players following their participation in research projects (national or EU-funded), and in particular those which have led to the deployment of solutions in the field of operations, or which have a strong potential for uptake as a result of the interest expressed by national buyers.

Finally, this will support the promotion of innovation uptake with financial pathways and opportunities to enable the uptake of innovative solutions stemming from EU, national or regional capacity building funds, with special emphasis on the EU Home Affairs funds (both in the parts under shared management and those under direct management by the Commission) and on the European Regional Development Fund.

As an output of the action, the beneficiaries should develop a model for the cooperation and enlargement of with the national research and innovation communities beyond the lifetime of the project and independent of EU security research funding. The objective is to support the establishment of self-standing national communities beyond the duration of the project.

⁸⁷ https://home-affairs.ec.europa.eu/networks/ceris-community-european-research-and-innovation-security_en

The successful proposal will contribute to delivering the Programme's objectives and impacts and raise awareness of potential applicants for calls under Horizon Europe Cluster 3 – "Civil Security for Society". Irrespectively of their sector or discipline, project proposals should aim to facilitate trans-national co-operation between NCPs, with a view to identifying and sharing good practices and raising the general standard of support to Programme applicants. The project should also allow for a better flow of information relevant for the implementation of the Programme from the EU level to the national level and vice-versa, and also across Member States and Associated Countries. This includes fostering the participation of national players in EU security research and innovation fora. Particular attention should be given to results that have led to the deployment of solutions in the field of operations, or that show a strong potential for uptake because of the interest expressed by national buyers.

Proposals should link up potential participants from widening countries with emerging consortia in the domain of the Cluster "Civil Security for Society" building on previous initiatives from similar past projects. Matchmaking should take place by means of online tools, brokerage events, info days and bilateral meetings between project initiators and candidate participants from widening countries. Other matchmaking instruments may be used as appropriate. The project proposal to be funded should cover a wide range of activities related to Horizon Europe, address issues specific to the Cluster "Civil Security for Society" and may follow up on the work of SEREN5.

The network should organise matchmaking activities in accordance with Annex IV of the NCP Minimum Standards and Guiding Principles. Proposals should also take into account support activities for coordination between the respective beneficiary (NCP) and the respective National Coordination Centre⁸⁸ within the relevant Member States as applicable once the regulation mentioned above is in force.

The project consortium should have a good representation of experienced and less experienced NCPs.

The recommended duration of the project is 3 years.

HORIZON-CL3-2025-01-SSRI-02: Uptake Acceleration Services

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.

⁸⁸ National Coordination Centres according to regulation (EU) 2021/887 of the European Parliament and of the Council of 20 May 2021.

<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility conditions apply:</p> <p>Participation as beneficiaries of at least 2 Research and Technology Organisations is required.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of prizes/grants. The maximum amount to be granted to each third party is EUR 60 000.</p>

Expected Outcome: Projects' results are expected to contribute to some or all of the following outcomes:

- To offer advanced services on innovation uptake to the security community;
- To provide a self-sustained mechanism for advanced advisory and support services, to act as a market catalyst; and to accelerate the uptake of innovation for security;
- Enhanced cooperation between research institutions, smaller private research agencies, security practitioners, Start-ups and SMEs to support innovation uptake;
- Strengthening the technology transfer from research to the market and strengthening of security ecosystem. Supporting Start-ups and SME to reach the security market and strengthen the capacity of security practitioners to uptake innovative tools from the security market.

Scope: The uptake of innovation stemming from EU-funded security research is not a single-step process, and there is no single method of ensuring the market uptake of successful research results. Innovation uptake needs to be contemplated as a long process that is conditioned by a number of enabling actions to be taken before research is even planned and long after it is completed. However, market uptake and deployment of innovation by security practitioners are recurrent challenges in civil security research.

The EU-funded security research ecosystem has changed the traditional relationship between practitioners and solution providers. The awareness of security needs and solutions has been steadily growing at all levels during the last years, with EU funded security research and innovation projects playing a pivotal role. This awareness guarantees not only that research addresses critical needs, but also that the research investment will deliver tangible results.

There are several approaches to achieve a better market uptake and to ensure that innovation can pass from the realm of research to the realm of the market and eventually innovative tools to be used by security practitioners.

In order to support SMEs and start-ups but also practitioners to find the avenues of uptake of innovation, models and methods for transferring research to the market should be promoted. This topic aims to offer services and guidance to entities in the security ecosystem to achieve market uptake.

The services should be delivered to SMEs/Start-ups and Practitioners. Therefore, there would be Supply-oriented Services and Demand-oriented services.

Some of the expected services could be open for the whole community (e.g., material online) and examples of good practices, whereas others would be provided upon specific request by an entity (on demand services). On demand services may be linked to other EU-funded actions but should not cover activities already funded from those in order to avoid double funding.

Applicants should be able to demonstrate a proven experience in technology development and innovation in the area of security and deep knowledge on the security ecosystem.

Successful candidates should be able to provide services such as:

- Funding & procurement guidance
- Market research / competitive landscaping / Marketplaces / Market surveys/consultations
- Proof of concept development (for TRL 2-4)
- Funding and tendering observatory
- Investor search / venture building
- Technology validation support Lab testing support (i.e., Readiness assessment, Artificial Intelligence act compliance, Machine Learning security, Ethical Legal and Societal assessment, High Performance Computing capabilities, Synthetic data generation, Access to Datasets, stress testing etc.)
- Tech and/or entrepreneurial skills development (training)

The proposals should outline the methods and processes by which they intend to decide which organisations they provide support to, respecting principles such as transparency, equal treatment, non-discrimination between organisations and effectiveness (impact). The project should provide suggestions for such methods and processes as deliverable to be approved by the European Commission. The applicants submitting the proposals have to ensure sufficient representativeness of the communities of interest (including, but not only, geographical representativeness) and a balanced coverage in terms of knowledge and skills of the different knowledge domains required to face the challenge, including security operations,

technologies, research & innovation, industry, market, etc. The applying consortia need to demonstrate that the project beneficiaries guarantee the expertise required to steer the project activities in all the knowledge domains to ensure the success of the action. The work of the partners has to be supported by solid and recognised tools and methods, also accompanied by the required expertise to put them in practice.

Proposals should take into account the work initiated by the Networks of Practitioners funded under H2020 Secure Societies work programmes and the ongoing work of Knowledge Networks. Proposals should build to the extent possible on the outcomes of previous initiatives that foster innovation uptake (e.g., iProcureNet⁸⁹ Multirate⁹⁰, etc). In addition, existing initiatives like Horizon Booster⁹¹ EACTDA⁹² and EAFIP⁹³ have some components which could be used by the successful project and to be adapted in the area of security.

The project has to identify and describe options for the sustainability of the services beyond the project lifetime, including the setting up of a permanent scheme which will continue to offer the proposed services to the community as a self-sustainable mechanism.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

The project should have a maximum estimated duration of 5 years.

The provision of financial support to third parties in the form of grants is optional.

HORIZON-CL3-2025-01-SSRI-03: Open grounds for pre-commercial procurement of innovative security technologies

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 1.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply:

⁸⁹ <https://www.iprocurenet.eu/>

⁹⁰ <https://www.multirate.eu/>

⁹¹ <https://www.horizonresultsbooster.eu/>

⁹² <https://www.eactda.eu/>

⁹³ <https://eafip.eu/>

	<p>The following additional eligibility conditions apply:</p> <p>This topic requires the participation, as beneficiaries, of at least 6 end-user organisations as well as at least 3 public procurers. One beneficiary can have the role of end-user and public procurer simultaneously, both counting towards the number of such entities required for the additional eligibility condition. These beneficiaries must be from at least 3 different EU Member States or Associated Countries. For these participants, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>Open market consultations carried out during this project must take place in at least three EU Member States or Associated Countries.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁹⁴.</p>

Expected Outcome: Projects’ results are expected to contribute to some or all of the following outcomes:

- Consolidated demand for innovative security technologies built on the aggregation of public buyers with a common need expressed in functional and/or operational terms without prescribing technical solutions;
- Better informed decision-making related to investment in innovative security technologies based on a better understanding of the potential EU-based supply of technical alternatives that could address common needs of EU public buyers;
- Better informed decision-making related to investment in innovative security technologies based on an improved visibility of the potential demand in the EU market for common security technologies;
- Increased capacity of EU public procurers to align requirements with industry and future products and to attract innovation and innovators from security and other sectors through

⁹⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

common validation strategies, rapid innovation, experimentation and pre-commercial procurement;

- Increased innovation capacity of EU public procurers through the availability of innovative tendering guidance, commonly agreed validation strategies and evidence-based prospects of further joint procurement of common security solutions.

Scope: End-users and public procurers from several countries are invited to submit proposals for a preparatory action that should build the grounds for a future Pre-Commercial Procurement (PCP) action. Both this preparatory action and the future PCP action are open to proposals oriented to the acquisition of Research and Development (R&D) services for the development of innovative technologies, systems, tools or techniques to enhance border security, to fight against crime and terrorism, to protect infrastructure and public spaces, and/or to make societies more resilient against natural or human-made disasters.

In preparing the grounds for a possible future PCP action, the outputs of this Coordination and Support Action (CSA) should take into consideration:

- The policy priorities described in this Work Programme Part for the security areas mentioned above;
- The EU Directive for public procurement and in particular with the provisions related to PCP;
- The specific provisions and funding rates of PCP actions and the specific requirements for innovation procurement (PCP/PPI) supported by Horizon Europe grants, as stated in the General Annex H of the Horizon Europe Work Programme;
- The guidance for attracting innovators and innovation, as explained in the European Commission Guidance on Innovation Procurement C(2021) 4320, in particular those measures oriented to reduce the barriers to high-tech start-ups and innovative SMEs.

During the course of the project, the applicants are expected to deliver clear evidence on a number of aspects in order to justify and de-risk a possible follow-up PCP action, including:

- That the challenge is pertinent and that indeed a PCP action is required to complete the maturation cycle of certain technologies and to compare different alternatives;
- That there is a consolidated group of potential buyers with common needs and requirements which are committed to carry out a PCP action in order to be able to take an informed decision on a future joint procurement of innovative solutions;
- That there is a quantifiable and identifiable community of potential buyers (including and beyond those proposed as beneficiaries in the proposal) who would share to a wide extent the common needs and requirements defined and who could be interested in exploring further joint-uptake of solutions similar to those developed under the PCP,

should these prove to be technologically mature and operationally relevant by the end of the project;

- That the state of the art and the market (including research) has been explored and mapped, and that there are different technical alternatives to address the proposed challenge;
- That a future PCP tendering process is clear, that a draft planning has been proposed and that the supporting documentation and administrative procedures will be ready on due time in order to launch the call for the acquisition of R&D services according to the PCP rules;
- That the technology developments to be conducted in the future PCP can be done in compliance with European societal values, fundamental rights and applicable legislation, including in the area of free movement of persons, privacy and protection of personal data;
- That in developing technology solutions, societal and gender aspects (e.g., perception of security, possible side effects of technological solutions, societal resilience) can be taken into account in a comprehensive and thorough manner.

If the applicants intend to submit a proposal for a follow-up PCP in a future Horizon Europe Cluster 3 Work Programme, they should ensure that the above evidence is consolidated in the project deliverables of this CSA before the submission of the PCP proposal.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

The project should have a maximum estimated duration of 1 year.

HORIZON-CL3-2025-01-SSRI-04: Accelerating uptake through open proposals for advanced SME innovation

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 1.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility</i>	The conditions are described in General Annex B. The following

<i>conditions</i>	<p>exceptions apply:</p> <p>The following additional eligibility conditions apply:</p> <p>Consortia must include, as beneficiaries:</p> <ul style="list-style-type: none"> - A minimum of three (3) to a maximum of seven (7) partners. - At least 2 SMEs from 2 different Member States. - At least 1 end-user organisation in the areas addressed by the proposal, namely one of the following options: <ul style="list-style-type: none"> • Option A "Fighting Organised Crime and Terrorism" • Option B "Disaster-Resilient Society" • Option C "Resilient Infrastructure" and • Option D "Border Management", provided that the applications attain all thresholds. <p>Participation of non-SME industries and Research and Technology Organisations (RTOs) is not excluded, but it must be limited to 15% of the budget.</p> <p>At least 50% of the budget must be allocated to SMEs.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-8 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>Eligible proposals submitted under this topic and exceeding all the evaluation thresholds will be awarded a STEP Seal [https://strategic-technologies.europa.eu/about/step-seal_en].</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁹⁵.</p>

⁹⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: Projects' results are expected to contribute to some or all of the following outcomes:

- Development of a mature technological solution addressing EU security policy priorities in the areas addressed by the Cluster 3 work programme and in particular the destination of fighting crime and terrorism, disaster resilient societies, border management and resilient infrastructure.
- Facilitated access to civil security market for small innovators;
- Improved cooperation between public buyers and small supply market actors for a swifter uptake of innovation in response to short to mid-term needs;
- Stronger partnerships between small and medium EU security industry and technology actors to ensure the sustainability of the EU innovation capacity in the civil security domain and reduce technological dependencies from non-EU suppliers in critical security areas.

Scope: Europe's 25 million small and medium enterprises (SMEs) are the backbone of the EU economy. SMEs can bring innovation to societal challenges, including the security of EU citizens. Innovative SMEs and high-tech start-ups can transform and modernise EU security capabilities.

However, despite the innovation capacity of EU SMEs, these often experience difficulties in finding their way to the public markets. These include red tape in public contracts, access to new customers, access to finance, industrial competition and IP valorisation. These difficulties are exacerbated in markets that show restrictions of different kind, as it is the case of security.

Knowing that SMEs require additional support to reach the security buyers and that the collaboration opportunities offered by the projects of the Pillar II of Horizon Europe can be a catalyst for uptake, this topic aims to offer a collaborative environment for small and medium innovators to tailor their innovations to the specific needs of civil security end-users.

Applicants are invited to submit proposals for technology development along with the following principles:

- Focus on mature digital technological solutions aligned with STEP guidance⁹⁶ addressing EU security policy priorities in the areas addressed by the Cluster 3 Work Programme;
- Fostering collaboration between SMEs from different Member States and Associated Countries;

⁹⁶ For more information on STEP guidance - see the [Guidance Note concerning certain provisions of Regulation \(EU\) 2024/795 establishing the Strategic Technologies for Europe Platform \(STEP\)](#)

- Involving security end-users in the role of validator and potential first-adopter of the proposed innovations;
- Fostering collaboration schemes between small companies and research and technology organisations and/or big industrial players aimed at fostering innovative technology transfer or creating innovative business models that facilitate access to market and strengthen the innovation capacity of EU SMEs and start-ups in the domain of civil security.

Examples of activities to plan in the proposed projects include, but are not limited to: assimilating market requirements; facilitating access to additional funding; approaching potential public buyers; assess competitive landscape; supporting in innovation management (methodological and process innovation, business model innovation, market innovation); assist in IP management and exploitation; provide guidance for expansion to future markets, etc.

The participation of research and technology organisations should not focus on own technology development but on supporting the small industrial players in accelerating the technology transfer of innovative security solutions for their further development and production.

It is encouraged that one SME takes the coordinator role⁹⁷. Exceptions to this requirement should be duly justified.

The projects should have a maximum estimated duration of 2 years.

This topic contributes to the Strategic Technologies for Europe Platform (STEP⁹⁸) and addresses civil security technologies falling under the sectors of “Digital technologies and deep-tech innovation⁹⁹”. This topic contributes to the objectives stated in the STEP Regulation, i.e., to boost investment in critical technologies in Europe, and, to contribute to reducing or preventing the strategic dependencies of the Union.

HORIZON-CL3-2025-01-SSRI-05: Data repository for security research and innovation

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.

⁹⁷ If a MIDCAP is included in the proposal, it could also take the role of coordinator.

⁹⁸ OJ L, 2024/795, 29.2.2024, ELI: <http://data.europa.eu/eli/reg/2024/795/oj>

⁹⁹ https://strategic-technologies.europa.eu/index_en

<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following exceptions apply: subject to restrictions for the protection of European communication networks.</p>

Expected Outcome: Projects' results are expected to contribute to some or all of the following outcomes:

- Accurately gathered, stored, managed and preserved research training and testing data, disaggregated by gender if relevant, which is verified and selected in order to be realistic, up-to-date and sufficient, as well as to make research more trustworthy and reproducible;
- Researchers and projects can further increase the impact and visibility of their work by not just archiving research materials, but also opening them up for reuse and citation by other relevant actors and stakeholders;
- Properly shared and re-used relevant research data can save lives, help develop solutions and maximise the knowledge;
- Enhanced collaboration among relevant research community, improved trust between researchers and practitioners/end-users, facilitated co-operation between different research projects and reduced burden of wasted research or lost results.

Scope: The underlying idea of this topic is to avoid that security and disaster risk research projects obtain and prepare data that at the end of the projects is simply lost instead of being stored and shared for reuse.

In the security domain, due to its specificities, the special categories of data involved or/and unique limitations, which may call for additional requirements, a consolidated, common research database is particularly desired. It is of utmost importance that security practitioners are provided with an increased interoperability and improved (cross-border) exchange of data thanks to harmonised data file formats across Europe, which would easily take into account technological evolutions, i.e., be adaptable in time. Such a lack of realistic, up-to-date and sufficient training and testing data for research purposes and consequently the need for a database, data repository or any other effective and useful tool(s) to gather, manage and store varying security research data, have been regularly raised by the projects working in the area of security. The same is true of data on disaster risk management where national or regional analysis and forecasting databases or national disaster risk assessments can be fragmented or sealed without reasonable open, sustainable access to the wider community.

As a follow up of the outcomes and results of the LAGO project coming from the 2021 data topic: HORIZON-CL3-2021-FCT-01-04: Improved access to fighting crime and terrorism research data, the successful proposal, should subsequently focus on creation and deployment

of a fully functional and operational common research data repository, which will extend to cover other security research areas.

The LAGO project is currently developing the skeleton of how such a repository of R&I data should be created, by providing a detailed roadmap consisting of a clear set of rules, conditions and characteristics that such a consolidated database should have. This LAGO roadmap will provide technical, legal and ethical requirements for a training and testing research data repository mostly in the area of fighting crime and terrorism, but the same project will already take into account possible applications of identified solutions in different security research domains, such as infrastructure resilience, border management or disaster resilience. The LAGO roadmap will also assess if the repository should be centralised or distributed, how to deal with "aging" data, how efficiently projects should exchange data among them taking into account security R&I specificities.

Building on the skeleton of LAGO, the newly developed data repository will enable security community (researchers, practitioners, industry, policy makers) access the scientifically satisfactory amount of up-to-date high quality and realistic data which is or was used to develop reliable (mostly digital and based on AI but also non-digital and not linked with big data) tools, technologies and solutions in support of security research and innovation. This data repository could also be very useful for verification and validation of new innovative security solutions developed under various calls in the most recent Work Programme.

Taking into account the complexity of the future repository, a multi-faceted approach will be needed and the proposal, apart from the roadmap's findings developed by LAGO, should also build on, and not duplicate, LAGO's outcomes regarding the following aspects:

- What exact types of data should be stored in the repository;
- Interoperability with existing operational systems;
- Interoperability/compatibility with European open science cloud (EOSC), with the TESSERA project¹⁰⁰ as well as other potentially relevant architectures and initiatives such as European Data Spaces or GAIA-X;
- How to search for data;
- Data models for security research - Harmonising of data formats;
- Concept of operations for the use of the repository by/during EU-funded security R&I projects, modalities of use, user profiles/schemes, etc.
- Legal issues, avoidance of any bias, accessibility levels related to the sensitivity of various data sets, solutions for annotation as well as for the aging of the data, etc.

¹⁰⁰ TESSERA project: 'Towards the datasets for the European Security Data Space for Innovation'. Internal Security Fund (ISF-2021-TF1-AG-DATA - data sets for the European Data Space for innovation). Duration: 03/2024 - 02/2026 (24 months).

The proposal should carry out extensive testing and evaluation (verification and validation), in close cooperation with ongoing projects, which would access the repository, populate it and use data intensively during the project implementation.

The proposal should develop an exploitation and sustainability plan following up the planning activities of LAGO, including funding instruments to be used for the operationalisation of the repository developed under the project as well as finding possibilities to maintain the repository after the lifetime of the project so that it not only continues to well function but is able to be extended with new data. The data repository will need to grow so it will have to be treated as an ongoing system. Co-ordination with already existing platforms or communities already using another reliable domain-specific data repository/ies for archiving and sharing research data is strongly recommended in order to verify if it would be possible to adhere in the future to a larger system or infrastructure of repositories such as European Open Science Cloud (EOSC) for example and other relevant activities.

Adopting sound security practices, such as developing comprehensive access rules to allow only authorized users with a legitimate need to access, modify, or transmit data, are crucial. Combined with a digital signature approach or multi-factor authentication, access rules go a long way in keeping sensitive data stored in a data repository secure. These and other security measures, such as the anonymisation of personal data, will enable the research community to fully leverage large volumes of data without introducing unnecessary security risks.

The repository developed by the proposal should preserve research data relevant to various security research domains, such as fighting crime and terrorism, infrastructure resilience, border management or disaster resilience across time and help security research community easily find, access and re-use the necessary data. The development and the functioning of the repository will be based on the outcomes of the roadmap from the LAGO project¹⁰¹ from 2021 FCT call project within the remits of Horizon Europe regulation (including ethics). The repository should be operational to be tested for at least one year before the project ends. Data sharing will be based on open science principle of ‘as open as possible, as closed as necessary’. Particular efforts should be made to ensure that the data produced in the context of this topic is FAIR (Findable, Accessible, Interoperable and Re-usable). To make data FAIR, the basics of good Research Data Management will have to be applied.

All necessary system features as well as the functioning of the repository should comply with privacy and data protection requirements when handling data, in order to facilitate data management ensuring full access to the data actually needed (in line with the necessity and proportionality principle and in full respect of fundamental rights and applicable legislation).

Projects should take into account, during their lifetime, relevant activities and initiatives for ensuring and improving the quality of scientific software and code, such as those resulting from projects funded under the topic HORIZON-INFRA-2023-EOSC-01-02 on the development of community-based approaches.

¹⁰¹ <https://lago-europe.eu/>

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

The project should have a maximum estimated duration of 3 years.

HORIZON-CL3-2025-01-SSRI-06: Demand-led innovation for civil security through Pre-Commercial Procurement (PCP)

Call: Civil Security for Society	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.50 million.
<i>Type of Action</i>	Pre-commercial Procurement
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply:</p> <p>This topic requires the participation¹⁰², as beneficiaries, of at least 3 practitioners and 3 public procurers from 3 different EU Member States or Associated Countries. One organisation can have the role of practitioner and public procurer simultaneously, both counting for the overall number of organisations required for eligibility.</p> <p>For participants with practitioner status, applicants must fill in the table “Information about security practitioners” in the application form with all the requested information, following the template provided in the submission IT tool.</p> <p>The specific conditions for actions with PCP/PPI procurements in section H of the General Annexes apply to grants funded under this topic.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-8 by the end of the project – see General Annex B.
<i>Legal and financial set-up of</i>	The rules are described in General Annex G. The following exceptions apply:

¹⁰² see General Annexes p.13-14 on the Consortium Composition as regards Pre-commercial Procurement

<i>the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>PCP/PPI procurement costs are eligible.</p> <p>The specific conditions for actions with PCP/PPI procurements in section H of the General Annexes apply to grants funded under this topic.</p> <p>Beneficiaries must ensure that the subcontracted work is performed in at least 3 Member States — unless otherwise approved by the granting authority.</p>
-----------------------------	--

Expected Outcome: Projects' results are expected to contribute to the following outcomes:

- A community of EU civil security practitioners with shared needs for innovative technology solutions, supported by an industrial base in particular SMEs and Startups, to access the public procurement market and scale up their business;
- Procurers facilitate the commercialisation of innovative solutions by their successful suppliers through providing them with first customer references for the validation and first pilot deployment;
- Increased opportunities for wide market uptake and economies of scale for the supply side through increased demand for innovative solutions, wide publication of results and where relevant contribution to standardisation, regulation or certification;
- Supporting public procurers, to collectively implement PCPs to drive innovation from the demand side and open up wider commercialisation opportunities for companies in Europe to take or maintain international leadership in new markets that can deliver innovative solutions.

Scope: As past experience shows that pre-commercial procurement opens up the procurement market for startups and enables the public sector to address societal challenges more effectively, public procurers should make more strategic use of PCP. Applicants are invited to submit proposals for PCP action to acquire Research and Development (R&D) services and innovative civil security technology solutions.

Proposals should demonstrate interest from a broader community of potential buyers, beyond the direct beneficiaries, who share similar needs and are open to jointly adopting the solutions developed, provided they are proven mature and operationally viable. The proposals must include an analysis of the state of the art and market landscape, aligning research activities with identified needs and presenting a range of technical alternatives to address the challenge. Furthermore, to stimulate dialogue with the supply side, public procurers are required to organise proposals should demonstrate sustainability of the action beyond the life of the project.

The proposals should build on the outcomes of CSA projects funded under previous work programmes aimed at creating *Stronger grounds for pre-commercial procurement of innovative security technologies*. The proposals should provide clear evidence to justify and de-risk the PCP action, demonstrating that the identified challenge is significant and necessitates a PCP action to mature certain technologies and compare alternatives. It must be shown that a consolidated group of practitioners and procurers with shared needs and requirements is committed to the PCP process, enabling informed decisions on future joint procurement of innovative solutions. Activities covered should include cooperation with policy makers to reinforce the national policy frameworks and mobilise substantial additional national budgets for PCP and innovation procurement in general beyond the scope of the project. The tendering process must be well-defined, supported by a draft plan, and include readiness of documentation and administrative procedures to ensure a compliant launch of the call for R&D services under PCP rules.

Proposals must demonstrate commitment to exploiting project results beyond its conclusion, ensuring engagement with stakeholders and implementation of strategies for future uptake. Applicants should also clarify measures to ensure compliance with the principles of the EU Directive on public procurement, particularly those related to PCP. The required open market consultations should be completed in at least three EU Member States. Prior consultations conducted under previous CSA projects may be used, provided they ensured procurement viability and remain relevant to the current state of the art.

Involvement of procurement decision makers is needed to ensure that end solution(s) are adopted by public buyers, increasing the societal impact of the related research activities. Therefore, procurers should declare in the proposal their interest to pursue deployment of solutions resulting from the PCP in case the PCP delivers successful solutions and indicate whether they will:

1. procure successful solution(s) as part of the PCP.
2. launch a separate follow-up procurement after the PCP to buy such type of solutions.
3. adopt successful solutions without the need to procure them (e.g. in case of open-source solutions).
4. foresee financial or regulatory incentives for others to adopt successful solutions (e.g. in case the final end-users of the solutions are not the procurers but for example citizens).

In these four cases, the procurers can implement the project as a fast-track PCP¹⁰³. In the first case, the procurers must foresee the budget in the proposal to purchase at least one solution during the PCP. In the second case, the procurers should include in the proposal a deliverable that prepares the follow-up procurement to purchase such type of solution(s) after the PCP. In the first and third case, the procurers must foresee sufficient time during the project to deploy and validate that the solutions function well after installation. In the fourth case, the procurers

¹⁰³ see General Annex H of the Horizon Europe Work Programme.

can use financial support to third parties to provide financial incentives to final end-users to adopt the solutions, with a maximum budget of EUR 100.000.

Applicants should propose an implementation of the project that includes:

- A minimal preparation stage dedicated to finalising the tendering documents package for a PCP call for tenders based on the technical input, and to define clear verification and validation procedures, methods and tools for the evaluation of the prototypes to be developed throughout the PCP phases.
- Moreover, to ensure the sustainability and uptake of the developed solutions, proposals should outline clear plans for post-PCP activities. As outlined in the general annexes of the Horizon Europe Work Programme, the topic allows public buyers to use the fast-track PCP option (e.g. 2 instead of 3 phases) when they commit to buying or deploying the resulting solutions after the PCP. However, if such a commitment is not yet in place at the proposal stage, the call requires proposers to include a deliverable outlining concrete activities to prepare the ground for follow-up deployment or procurement after the PCP.
- Launching the call for tenders for research and development services. The call for tenders should envisage a competitive development composed of different phases that would lead to at least 2 prototypes from 2 different providers to be validated in real operational environment at the end of the PCP cycle;
- Conducting the competitive development of the prototypes following the PCP principles including a design phase, an integration and technical verification phase and a validation in real operational environment phase. In evaluating the proposals and the results of the PCP phases, the applicants should consider technical merit, feasibility and commercial potential of proposed research efforts.
- Consolidating the results of the evaluation of the developed prototypes, extracting conclusions and recommendations from the validation process, and defining a strategy for a potential uptake of solutions inspired in the PCP outcomes, including a complete technical specification of the envisaged solutions and standardisation needs and/or proposals. This strategy should consider joint-cross border procurement schemes and exploit synergies with other EU and national non-research funds.

The applicants are expected to maximise the visibility of the project outcomes to the wide community of potential EU public buyers. Liaison with other civil security communities beyond those addressed by the project is encouraged in order to assess the possible reuse and extensibility of the identified solutions to different domains.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Other actions not subject to calls for proposals

1. External expertise for reviews of projects

This action will support the use of appointed independent experts for the monitoring of actions (grant agreement, grant decision, public procurement actions, financial instruments) funded under Horizon Europe and previous Framework Programmes for Research and Innovation, and where appropriate include ethics checks, as well as compliance checks regarding the Gender Equality Plan eligibility criterion.

Form of Funding: Other budget implementation instruments

Type of Action: Expert contract action

Indicative budget: EUR 0.10 million from the 2025 budget

2. Workshops, conferences, experts, communication activities, studies and innovation uptake promotion

- Support to workshops, expert groups, communications activities, or studies. Workshops are planned to be organised on various topics to involve end-users (e.g. the Community for European Research and Innovation for Security); preparation of information and communication materials, etc.
- Organisation of cybersecurity conferences and support to other cybersecurity events; socio-economic studies, impact analysis studies and studies to support the monitoring, evaluation and strategy definition for cybersecurity and digital privacy policy.
- Support to promotion of innovation uptake, including through supporting developing certification testing methodologies for innovative technologies.
- Needs analysis and options for enabling the sharing of security research projects outputs (tools).

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 1.19 million from the 2025 budget

3. Indirectly Managed Action by the ECCC

The Commission intends to conclude a contribution agreement with the European Cybersecurity Competence Centre (ECCC) for the implementation of Horizon Europe cybersecurity actions not co-funded by Member States, in accordance with Article 5(5) of Regulation (EU) 2021/8878. Further to the contribution agreement, the ECCC will launch a call for proposals in accordance with the specifications in the Appendix set out below. These

include topics where participation will be limited in accordance with Article 22(5) of the Horizon Europe Regulation to legal entities established in Member States and Horizon Europe Associated Countries (eligible countries). In addition, for such topics, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, will not be eligible to participate.

The Commission intends to conclude a contribution agreement with the ECCC, in accordance with Article 5(5) of Regulation (EU) 2021/8878. In particular, the contribution agreement will entrust the ECCC with the implementation of a call for proposals according to the specifications in the Appendix set out below.

Legal entities:

European Cybersecurity Competence Centre (ECCC), Polytechnic University of Bucharest, Strada Splaiul Independentei Nr.313, Sector 6, Bucharest 060042, Romania

Form of Funding: Indirectly managed actions

Type of Action: Indirectly managed action

Indicative budget: EUR 90.55 million from the 2025 budget

APPENDIX – Indirectly managed action by the ECCC

Specifications of the ‘Increased Cybersecurity’ call to be launched by ECCC

Call - Increased Cybersecurity

HORIZON-CL3-2025-02-CS-ECCC

Conditions of the call¹⁰⁴

Proposals are invited against the following topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ¹⁰⁵	Indicative number of projects expected to be funded
		2025		

¹⁰⁴ The Executive Director-of the ECCC may decide to open the call up to one month prior to or after the envisaged date(s) of opening.

The Executive Director of the ECCC may delay the deadline(s) by up to two months.

All deadlines are at 17.00.00 Brussels local time.

The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

¹⁰⁵ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

Horizon Europe - Work Programme 2025
Civil Security for Society

Opening: 12 Jun 2025 (tentative)				
Deadline(s): 12 Nov 2025 (tentative)				
HORIZON-CL3-2025-02-CS-ECCC-01: Generative AI for Cybersecurity applications	RIA	40.00	12.00 to 14.00	3
HORIZON-CL3-2025-02-CS-ECCC-02: New advanced tools and processes for Operational Cybersecurity	IA	23.55	4.50 to 6.00	4

HORIZON-CL3-2025-02-CS-ECCC-06: Integration of Post-Quantum Cryptography (PQC) algorithms into high-level protocols	RIA	6.00	2.00 to 3.00	2
Overall indicative budget		90.55		

General conditions relating to this call	
<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and exclusion</i>	The criteria are described in General Annex C.
<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General

	Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

HORIZON-CL3-2025-02-ECCC-01: Generative AI for Cybersecurity applications

Call: Increased Cybersecurity	
Specific conditions	
<i>Expected EU contribution per project</i>	It is estimated that an EU contribution of between EUR 12.00 and 14.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 40.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, participation in this topic is limited to legal entities established in Member States and Associated Countries.</p> <p>In order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, shall not participate in the action.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio covering a broad range of research areas, grants will be awarded to applications not only in order of ranking but at least also to the two highest ranked proposal addressing expected outcome a) and the highest ranked proposal addressing expected outcome b), provided that the applications attain all thresholds.</p>
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU

	classified and sensitive information of the General Annexes.
--	--

Expected Impact: Action launched by the ECCC to incorporate ‘expected impact’ language set out in the ‘Destination – Increased Cybersecurity’ section of this work programme part.

Expected Outcome: Projects will develop technologies, tools, processes that reinforce cybersecurity using AI technological components, in particular Generative AI, in line with relevant EU policy, legal and ethical requirements.

Proposals should address at least one of the following expected outcomes:

- a. Developing, training and testing of Generative AI models for monitoring, detection, response and self-healing capabilities in digital processes, and systems against cyberattacks, including adversarial AI attacks.
- b. Development of Generative AI tools and technologies for continuous monitoring, compliance and automated remediation. These should consider legal aspects of EU and national regulation as well as ethical and privacy aspects.

Scope: The use of Artificial intelligence is becoming indispensable with applications where massive data is involved. Understanding all implications for cybersecurity requires deeper analysis and further research and innovation.

Generative AI presents both opportunities and challenges in the field of cybersecurity. This topic supports the research on new opportunities brought by Generative AI for Cybersecurity applications, to develop, train and test AI models to scale up detection of threats and vulnerabilities, enhance response time, cope with the large quantities of data involved, and automate process and decision-making support; for example by generating reports from threat intelligence data, suggesting and writing detection rules, threat hunts, and queries for the Security information and event management (SIEM), creating management, audit and compliance reports and reverse engineering malware.

Proposals addressing expected outcome a)

(a) (i) **Advanced threat and anomaly detection and analysis:** Current cybersecurity tools may struggle to keep pace with the evolving tactics of cyber attackers. Developing, training and testing of Generative AI models can be used to analyse large volumes of data and accurately identify anomalies and deviations from normal patterns of behaviour, enabling more effective threat detection, analysis and response.

Tools should also support cybersecurity professionals as they may struggle to detect and respond to threats posed by generative AI, particularly as these systems become more sophisticated and difficult to distinguish from genuine human activity.

(a) (ii) **Adaptive security measures:** Cybersecurity tools often rely on static rules and signatures to detect threats, making them less effective against new and evolving attack methods. In addition, many cybersecurity tools still rely on manual intervention for threat

response, which can be time-consuming and ineffective. Generative AI, through development, training, finetuning and testing of Generative AI models can support these tools to adapt and respond to emerging threats in real-time, improving overall security posture.

(a) (iii) **Enhanced authentication and access control:** The use of AI technologies could improve resilience of authentication and access control systems to unauthorized access and credential theft, making it more difficult for unauthorized users to gain access to sensitive information or systems.

Proposals addressing expected outcome b)

(b) (i) Development of tools powered by Generative AI that analyse and facilitate the **Application of the national and EU regulation in digital systems**, in particular the Artificial Intelligence Act, the Directive on measures for a high common level of cybersecurity across the Union (NIS2) and the Cyber Resilience Act.

(b) (ii) **Adaptation to a dynamic environment.** Companies, public sector and organisations face an ever-changing environment which makes keeping up with compliance towards cybersecurity rules challenging. On one hand there's a variety of rules applicable at sectorial, national or European level to be considered. On the other, change management and updates in ICT systems in organisations is frequent. Addressing both facets with tools powered with Generative AI brings the potential for a compliance continuum within organisations otherwise limited in time when driven by human intervention only.

All proposals are expected to respect Trustworthy and Responsible AI principles¹⁰⁶ and data privacy.

All proposals should demonstrate the EU added value by fostering the development of EU technology, the use of open-source technologies when technically and economically feasible, the exploitation of available EU data (Data Spaces, EOSC, federated data etc)

Proposals should define key performance indicators (KPI), with baseline targets to measure progress and to demonstrate how the proposed work will bring significant advancement to the state-of-the-art. All technologies and tools developed should be appropriately documented, to support take-up and replicability. Participation of SMEs is encouraged.

Proposals are expected to pay special attention to the Intellectual Property dimension of the results. The usability of the outcomes and results once the project is finished will be closely assessed.

HORIZON-CL3-2025-02-CS-ECCC-02: New advanced tools and processes for Operational Cybersecurity

Call: Increased Cybersecurity

¹⁰⁶ https://research-and-innovation.ec.europa.eu/news/all-research-and-innovation-news/guidelines-responsible-use-generative-ai-research-developed-european-research-area-forum-2024-03-20_en

Specific conditions	
<i>Expected EU contribution per project</i>	It is estimated that an EU contribution of between EUR 4.50 and 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 23.55 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, participation in this topic is limited to legal entities established in Member States and Associated Countries.</p> <p>In order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, shall not participate in the action.</p>
<i>Technology Readiness Level</i>	Tools and technologies developed are expected to start the project at minimum at TRL 4 and achieve at least TRL 7 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025)¹⁰⁷.</p>
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

¹⁰⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Impact: Action launched by the ECCC to incorporate ‘expected impact’ language set out in the ‘Destination – Increased Cybersecurity’ section of this work programme part.

Expected Outcome: The use of and dependence on information and communication technologies have become fundamental aspects in all sectors of the economy. Public administrations, companies and citizens are more interconnected and interdependent across sectors and borders than ever before. This higher uptake of digital technologies increases exposure to cyber security incidents, vulnerabilities and their potential impacts. At the same time, Member States are facing growing cybersecurity risks and an overall complex threat landscape, with a clear risk of rapid spill-over of cyber incidents from one Member State to others.

Moreover, cyber operations are increasingly integrated in hybrid and warfare strategies, with significant effects on the target. In particular, the current geopolitical context is being accompanied by a strategy of hostile cyber operations, which is a game changer for the perception and assessment of the EU’s collective cybersecurity crisis management preparedness and a call for urgent action. The threat of a possible large-scale incident causing significant disruption and damage to critical infrastructure and data spaces demands heightened preparedness at all levels of the EU’s cybersecurity ecosystem. In recent years, the number of cyberattacks has increased dramatically, including supply chain attacks aiming at cyberespionage, ransomware, or disruption. The vulnerability landscape is also threatening. The ENISA Threat Landscape Report 2024¹⁰⁸ counts a total of 19,754 vulnerabilities. This amount of vulnerabilities can’t be manually managed by humans. There is a need for automated management of vulnerabilities based on established standards like the Common Security Advisory Framework (CSAF)¹⁰⁹.

As regards detection of cyber threats and incidents, there is an urgent need to increase the exchange of information and improve our collective capabilities in order to reduce drastically the time needed to detect cyber threats and mitigate, before they can cause large-scale damage and costs. While many cybersecurity threats and incidents have a potential cross-border dimension, due to the interconnection of digital infrastructures, the sharing of relevant information among Member States remains limited. Proposals are expected to address this emerging threat landscape with the development of advanced frameworks, services tools, and processes, in line with relevant EU legislation (NIS2, Cyber Resilience Act, Cyber Solidarity Act).

Lastly, focus should be given to developing innovative frameworks, technologies, tools, processes, and services that reinforce cybersecurity capabilities for operational and technical cybersecurity cooperation, in line with relevant EU policy, with particular focus on NIS2, Cyber Solidarity Act and the EU Cybersecurity Strategy, as well as legal and ethical requirements.

Proposals should address at least two of the following expected outcomes:

¹⁰⁸ The ENISA Threat Landscape Report 2024: ENISA Threat Landscape Report 2024: <https://www.enisa.europa.eu/publications/enisa-threat-landscape-2024>

¹⁰⁹ Common Security Advisory Framework (CSAF): <https://csaf.io/>

- Enhanced Situational Awareness through advanced Cyber Threat Intelligence frameworks, tools, and services as well as cybersecurity risk assessments of critical supply chains made in the EU,
- Frameworks, tools, and services for preparedness against Cyber and Hybrid Threats in information and communication technology (ICT) and operational technology (OT), including cybersecurity exercises,
- Expanded Security Operations Centre/Computer Security Incident Response Teams (SOC/CSIRT) functionality through advanced tools and services for detection, analysis, incident handling including response and reporting as well as remediation,
- Development of testing and experimentation facilities for advanced tools and processes for operational cybersecurity, including the creation of digital twins for critical infrastructures and essential and important entities as defined in NIS2,
- Development and pilot implementation of cross-sector and/or cross-border cyber crisis management frameworks, services, and tools,
- Frameworks, services, and tools aimed at mechanisms and processes for enhanced operational cooperation between public sector entities (CSIRT network, EU-CyCLONe). Extension of the above to essential and important entities as defined in NIS2¹¹⁰, would be an advantage.

Scope: Proposals are expected to demonstrate the developed frameworks, tools, services, and processes through pilot implementations involving the participation of relevant national cybersecurity authorities and/or essential and important entities as defined in NIS2, implemented with the participation of leading European cybersecurity industry. Proposals should consider the impact of forthcoming legislation, in particular the Cyber Resilience Act.

Real world applications and the usability of the solutions developed should feature predominately in the proposals.

The participation of the following types of entities is highly encouraged: innovative European cybersecurity start-ups and SMEs with a proven track-record in cybersecurity innovation at EU level (e.g. active participation in successful EU funded projects including cybersecurity projects under Horizon Europe, Digital Europe Programme cybersecurity projects or EIC Pathfinder or Accelerator projects), European start-ups and SMEs that can demonstrate established operational cooperation with relevant National Cybersecurity Authorities, European start-ups and SMEs that have received equity investments by national, European or private Venture Capital funds for cybersecurity activities etc. The participation of these start-ups and SMEs with an active role in the implementation of the proposed action (project coordination, technical coordination, lead of pilot implementation etc) would be considered an asset.

¹¹⁰ Directive on measures for a high common level of cybersecurity across the Union: <https://eur-lex.europa.eu/eli/dir/2022/2555>

HORIZON-CL3-2025-02-CS-ECCC-03: Privacy Enhancing Technologies

Call: Increased Cybersecurity		
Specific conditions		
<i>Expected contribution per project</i>	<i>EU per</i>	It is estimated that an EU contribution of between EUR 3.00 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>		The total indicative budget for the topic is EUR 11.00 million.
<i>Eligibility conditions</i>		The conditions are described in General Annex B. The following exceptions apply: subject to restrictions for the protection of European communication networks.
<i>Type of Action</i>		Research and Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>		The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹¹¹ .
<i>Security Sensitive Topics</i>		Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Impact: Action launched by the ECCC to incorporate ‘expected impact’ language set out in the ‘Destination – Increased Cybersecurity’ section of this work programme part

Expected Outcome: Projects’ results are expected to contribute to some or all of the following outcomes:

- Development of robust, scalable, and reliable technologies to uphold privacy within federated and secure data sharing frameworks, as well as in the processing of personal and industrial data, integrated into real-world systems.

¹¹¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Development of privacy preserving approaches for data sharing solutions, including privacy-preserving cyber threat information sharing, and in collaborative computations involving sensitive data.
- Integration of privacy-by-design at the core of software and protocol development processes, with attention to ensure that cryptographic building blocks and implementations of privacy-enhancing digital signatures and user-authentication schemes are crypto-agile and modular, to facilitate a transition towards post-quantum cryptographic algorithms.
- Development of privacy enhancing technologies for the users of constrained devices.
- Contribution towards the advancement of GDPR-compliant European data spaces for digital services and research, such as those on health data, aligning with DATA Topics of Horizon Europe Cluster 4.
- Development of privacy enhancing technologies and solutions, to benefit the requirements of citizens and companies, including small and medium-sized enterprises (SMEs).
- Development of blockchain-based and decentralized privacy-enhancing technologies, to preserve data confidentiality, integrity, and the authenticity of transactions and digital assets. Possible combination of blockchain with other technologies, such as federated learning, will need to address the data's security and privacy shared through such networks while ensuring that their connected devices are trusted.
- Investigating the usability and user experience of privacy-enhancing technologies and exploring ways to design systems that are both secure and user-friendly.

Scope: Protecting individuals' personal data and ensuring privacy while allowing for data processing and analysis is fundamental for our society. Privacy-preserving techniques allow to minimize the amount of personal data collected and processed, and to protect that data through advanced cryptographic methods. For instance, machine-learning methodologies are leveraged to dissect medical and behavioural data, aiming to unearth causations and insights into cyber attacks or threats. However, a substantial portion of this data comprises personal information, (such as sensitive health data), raising concerns over potential breaches or misuse, thus jeopardizing the privacy of individuals, societal well-being, and economic stability.

In addition, the challenges related to the exploitation of non-personal/industrial data assets, which could impede the full realization of the data-driven economy, are also subject to the work that can be proposed under this topic. Solutions that can provide security against quantum adversaries are also encouraged.

Privacy-enhancing technologies (PETs) such as cryptographic anonymous credentials, differential privacy, secure multiparty computation, homomorphic encryption, advanced digital signatures, such as ring signatures, blind signatures and attribute-based credentials hold

promise in mitigating these challenges, yet their practical application necessitates further refinement and rigorous testing. Consortia are encouraged to propose solutions that can improve the usability and effectiveness of different PETs in realistic environment and to investigate their integration within common European data spaces. The inclusion of agile schemes designed in a modular way to support the transition to post-quantum PETs and the design, improvement and security analysis of quantum-resistant PETs is welcome, in light of the advances of quantum technologies.

Proposals should also focus on enhancing the usability, scalability, and dependability of secure and PETs within supply chains, while seamlessly integrating with existing infrastructures and conventional security protocols. They should also accommodate the diversity in data types and models across various organizations, undergoing validation and pilot runs within authentic data environments. Adherence to data regulations, notably GDPR, is paramount.

Consortia should seek to intertwine interdisciplinary expertise and resources from industry stakeholders, service providers, and end-users. The engagement of SMEs is encouraged, alongside the inclusion of legal proficiency to ensure regulatory compliance, including GDPR adherence. Furthermore, proactive identification and assessment of potential regulatory hurdles and constraints for the developed technologies/solutions are strongly encouraged.

HORIZON-CL3-2025-02-CS-ECCC-04: Security evaluations of Post-Quantum Cryptography (PQC) primitives

Call: Increased Cybersecurity		
Specific conditions		
<i>Expected contribution per project</i>	<i>EU per</i>	It is estimated that an EU contribution of between EUR 2.00 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>		The total indicative budget for the topic is EUR 4.00 million.
<i>Type of Action</i>		Research and Innovation Actions
<i>Eligibility conditions</i>		<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, participation in this topic is limited to legal entities established in Member States and Associated Countries and OECD countries.</p> <p>In order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-</p>

	eligible country or by a non-eligible country entity, shall not participate in the action.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹¹² .
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Impact: Action launched by the ECCC to incorporate ‘expected impact’ language set out in the ‘Destination – Increased Cybersecurity’ section of this work programme part

Expected Outcome: Projects’ results are expected to contribute to some or all of the following outcomes:

- Breakthroughs in understanding the quantum hardness of various mathematical problem classes that underpin the security of current and future post-quantum cryptosystems;
- New quantum algorithms with significant quantum speed-up for lattice-based, code-based, and potentially other mathematical problem-classes;
- Improved implementation of quantum algorithms using high-level quantum programming languages to solve mathematical problems forming the core of cryptosystems;
- Establishment of environments testing the robustness of cryptosystems regarding quantum attackers;
- AI-based approaches to help discovering vulnerabilities of lattice-based or other mathematical problem-classes;
- Cryptanalysis results;

¹¹² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Parameter suggestions to create a robust set of cryptographic building blocks for post-quantum cybersecurity and design of post-quantum cryptosystems with improved security against quantum or AI-based attacks.

Scope: The intrinsic security of PQC algorithms is based on mathematical problems that are believed to be intractable for both classical and quantum computers. To assess the quantum security of post-quantum primitives is fundamental in order to boost our confidence on post-quantum cryptosystems. The development of quantum algorithms demonstrating a significant quantum speed-up would represent a major breakthrough, necessitating a reassessment of the security of cryptosystems (lattice-based, code-based, and others). Conversely, if no significant quantum speed-up is discovered, it would bolster our confidence in the security of these post-quantum cryptosystems, though some parameters may still require fine-tuning. Moreover, up to now existing quantum attackers have been analyzed mostly in a theoretical way. However, their application to nowadays cryptosystems fail due to a lack of efficient implementations and hardware. Studies are also needed on AI-based approaches that may be used to attack certain schemes with certain implementation choices, and the discovery of eventual vulnerabilities can help the research community develop more robust post-quantum cryptosystems.

Proposals on the assessment of the security of post-quantum primitives, via studies focused on eventual quantum algorithms with demonstrable speed-up, eventually also in combination with AI, or on solely AI-based approaches, are welcome. The security of lattice and code-based PQC algorithms may be prioritized, but tackling other mathematical problem classes is not excluded. As the unprecedented computational power of quantum computing can greatly enhance AI capabilities, combination of different approaches may also be considered. Consortia with team of applicants with background in post-quantum cryptography and in quantum computing are particularly encouraged. Projects should lead to identification of vulnerabilities of current post-quantum cryptographic building blocks and to practical recommendations for parameters for the design of post-quantum cryptosystems with improved security against quantum attacks and future advances in code-breaking and AI.

HORIZON-CL3-2025-02-CS-ECCC-05: Security of implementations of Post-Quantum Cryptography algorithms

Call: Increased Cybersecurity		
Specific conditions		
<i>Expected contribution per project</i>	<i>EU per</i>	It is estimated that an EU contribution of between EUR 2.00 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>		The total indicative budget for the topic is EUR 6.00 million.
<i>Type of Action</i>		Research and Innovation Actions

<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. <i>Security Sensitive Topics</i>	<p>Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.</p>

Expected Impact: Action launched by the ECCC to incorporate 'expected impact' language set out in the 'Destination – Increased Cybersecurity' section of this work programme part

Expected Outcome: Projects' results are expected to contribute to some or all of the following outcomes:

- Design and implementations of Post-Quantum Cryptography (PQC) algorithms that are resistant to side-channel and fault attacks;
- Optimized countermeasures taking into account a balanced trade-off between security, performance, and costs;
- Recommendations on implementing countermeasures for a broad range of attacks, also identifying the available and necessary hardware;

¹¹³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Analysis of new attacks or combinations of attacks, also eventually enhanced by AI, applicable to real-world conditions.
- Design of automated security evaluations for PQC implementations.

Scope: The security of the implementations of PQC algorithms is vital for maintaining the confidentiality, integrity, authenticity and availability of digital information and communications in the face of implementation attacks, such as, for example, side-channel attacks using information from timing, power consumption, electromagnetic radiation, fault attacks disturbing the secure operation of the device and their combination. Such attacks, eventually also enhanced by the use of deep learning, constitute significant threats to both (embedded and regular) software and hardware implementations. In various application areas such as IoT, cloud-based applications, automotive, measures to prevent such attacks currently lead to substantial resource overhead due to the complexity of the algorithms, and the security remains unclear given the limited exploration of different attack surfaces. Countermeasures, to the extent that they are available, may have significant impact on run-time and memory consumption. Resistance in PQC implementations to implementation attacks is an increasingly common concern among customers, especially when exploring the right balance between security and performance.

Evaluating the security of PQC algorithm implementations against side-channel and fault attacks is crucial, given the proven vulnerabilities. Various countermeasures, such as masking, shuffling, randomized clocking, random delay insertion, constant weight encoding, code polymorphism, control-flow integrity and re-computation of critical operations can be employed to mitigate these attacks. Synergies between specific countermeasures and the design of cryptographic systems are available for pre-quantum cryptography but require investigation for post-quantum cryptography.

Proposals are welcome on developing solutions that protect against such implementation attacks, at reasonable costs and minimizing the loss of performance while maintaining the required security, as well as on the analysis of new attacks or combinations of attacks, also powered by the use of AI, for security-by-design approaches when designing Post Quantum Cryptographic systems. Activities can also lead to the development of testing methodologies and frameworks for automated security evaluations for correctness and resistance to remote side-channel attacks for regular software and for correctness and resistance to a broad range of implementation attacks for embedded software and hardware.

HORIZON-CL3-2025-02-CS-ECCC-06: Integration of Post-Quantum Cryptography (PQC) algorithms into high-level protocols

Call: Increased Cybersecurity		
Specific conditions

Expected Impact: Action launched by the ECCC to incorporate ‘expected impact’ language set out in the ‘Destination – Increased Cybersecurity’ section of this work programme part

Expected Outcome: Proposals are expected to contribute to some or all of the following outcomes:

¹¹⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Design and implementations of at least one high-level post-quantum cryptography protocol along with a security analysis demonstrating that no security is lost compared to the used building blocks/lower-level protocols (KEMs, signatures, AEAD,...);
- Submission of these high-level protocols integrating PQC to standardization bodies and/or submission of the specification and implementation to the respective open source projects;
- Requirements analysis highlighting roadblocks and needs for development of PQC solutions for missing building blocks for migrating high-level protocols to PQC.

Scope: The transition to post-quantum cryptography requires changing the uses of most currently deployed public-key cryptography (RSA and ECC). Research and development efforts are providing signature systems and key-exchange mechanisms that are generally accepted to withstand attacks using classical and quantum computers. Efforts are on the way to include these in core Internet protocols such as Transport Layer Security (TLS). While this is an important development, many more protocols need to be modified to be quantum-ready and to ensure backward compatibility with legacy systems. Various application areas, such as Internet of Things, cloud-based applications, and automotive, place constraints on bandwidth or processing time which may prompt different choices than those employed for TLS. Currently used high-level protocols may have components that are specific to Elliptic Curve Cryptography (ECC) or to Rivest-Shamir-Adleman (RSA) or may require additional building blocks next to or in place of signatures and key-exchange mechanisms. While applications that provide authenticity are less urgent to migrate than those for confidentiality, those using embedded hardware such as secure elements, Two-Factor Authentication (2FA) and Multi-Factor Authentication (MFA) using hardware tokens and others have a very slow turnover and need to be replaced by the time large quantum computers exist, thus requiring migrating the design in the near future.

Activities should target one or multiple relevant high-level protocols and produce their post-quantum versions. Typically, this can be achieved through combining current and post-quantum solutions for backward compatibility. Atypical solutions with equivalent security are also welcome. Consortia composed by actors of different nature, such as, for example, research institutions, relevant public entities, and industry to ensure that PQC solutions meet real-world security demands and are robustly tested across various applications are also welcome.

Budget^{115 116}

	Budget line(s)	2025 Budget (EUR million)
Calls

Horizon Europe
Work Programme 2025

7. Digital, Industry and Space

IMPORTANT NOTICE:

This draft has not been adopted or endorsed by the European Commission. Any views expressed are the views of the Commission services and may not in any circumstances be regarded as stating an official position of the Commission.

This draft is made public before the adoption of the work programme to provide potential participants with the currently expected main lines of this work programme. Only the adopted work programme will have legal value.

The adoption of the work programme will be announced on the Horizon Europe website and on the Funding and Tenders Portal.

Information and topic descriptions indicated in this draft may not appear in the final work programme; and likewise, new elements may be introduced at a later stage. Any information disclosed by any other party shall not be construed as having been endorsed by or affiliated to the Commission.

The Commission expressly disclaims liability for any future changes of the content of this document.

Destinations	28
Destination 1: Achieving global leadership in climate-neutral, circular and digitised industrial and digital value chains	28
Manufacturing	30
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-01: Integrated approaches for remanufacturing (Made in Europe Partnership) (IA)	30
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-02: Physical and cognitive augmentation in advanced manufacturing (Made in Europe Partnership) (RIA)	33
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-05: Advanced manufacturing technologies for leadership of EU manufacturers in products for the net-zero industry (Made in Europe Partnership) (IA)	35
Construction	37
HORIZON-CL4-2025-05-TWIN-TRANSITION-11-two-stage: Enhanced logistics and operations of construction sites (IA)	37
Energy-Intensive Industries - Decarbonisation and Energy Efficiency	39
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-31: From heat-driven processes to the use of mechanical and electric forces (Processes4Planet partnership) (IA)	40
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-32: Green and resilient flexible production processes (Processes4Planet partnership) (IA)	41
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-33: Integrated use of renewable energy carriers in industrial sites (Processes4Planet partnership) (RIA)	43

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-34: Smart integration of net zero technologies into Energy Intensive industries (Processes4Planet and Made in Europe partnerships) (IA)	46
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-37: Solving issues in carbon-neutral iron and steel making processes with diverse input materials of varying quality (Clean Steel Partnership) (RIA)	48
Energy-intensive Industries - Circularity and Zero Pollution	52
HORIZON-CL4-2025-05-TWIN-TRANSITION-35-two-stage: Developing and embedding upcycling technologies into viable business (Processes4Planet partnership) (IA)	52
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-36: Safe and clean processing technologies and products (Processes4Planet partnership) (RIA)	55
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-38: Synergies and mutual learning with national and regional initiatives in Europe on Industrial decarbonisation (CSA)	57
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-39: Towards human-centric, sustainable and resilient energy-intensive industries (Processes4Planet and Clean Steel partnerships) (CSA).....	59
Social Circular Enterprises.....	61
HORIZON-CL4-2025-05-TWIN-TRANSITION-21-two-stage: Demonstrators for clusters of social circular enterprises (IA).....	61

Destination 2: Achieving technological leadership for Europe's open strategic autonomy in raw materials, chemicals and innovative materials

Raw Materials	67
HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-61: Technologies for critical raw materials and strategic raw materials from end-of-life products (IA).....	67
HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-62: Strategic Partnerships for Raw Materials: Innovative Approaches for sustainable production of Critical Raw Materials (IA)	70
HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-63: Innovative solutions for the sustainable production for Semiconductor raw materials (IA)	74
HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-64: EU Co-funded Partnership on raw materials for the green and digital transition (Co-funded partnership Raw Materials for the Green and Digital Transition).....	77
Innovative Advanced Materials.....	81
HORIZON-CL4-2025-05-MATERIALS-42-two-stage: Innovative Advanced Materials (IAMs) for product monitoring, smart maintenance and repair strategies in the construction sector (RIA) (Innovative Advanced Materials for Europe partnership)	82
HORIZON-CL4-2025-05-MATERIALS-43-two-stage: Innovative Advanced Materials (IAMs) for robust, fast curing sealants and coatings for manufacturing and final assembly (IA) (Innovative Advanced Materials for Europe partnership).....	86
HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-44: Innovative Advanced Materials Innovation Procurement (CSA).....	90

HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-45: Materials Commons for Europe (IA)	92
HORIZON-CL4-2025-03-MATERIALS-46: Innovative Advanced Materials (IAMs) for photonics, enabling low-power and ultra-broadband performance for telecommunication (RIA) (Innovative Advanced Materials for Europe partnership)	95
HORIZON-CL4-2025-03-MATERIALS-47: Innovative Advanced Materials (IAMs) for conformable, flexible or stretchable electronics (RIA) (Innovative Advanced Materials for Europe partnership)	97
Safe and Sustainable by Design	99
HORIZON-CL4-2025-05-MATERIALS-51-two-stage: Development of safe and sustainable by design alternatives to Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS) (IA)	99
HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-52: Accelerate the uptake of life-cycle assessment (LCA) for Safe and Sustainable by Design (SSbD) chemicals and materials and resulting products (RIA)	103
Textiles	106
HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-31: Digitally enabled local-for-local textile and apparel production (Textiles for the Future Partnership) (IA)	106
 Destination 3: Developing an agile and secure single market and infrastructure for data-services and trustworthy artificial intelligence services	
110	
Connected Collaborative Computing Networks (3C networks)	111
HORIZON-CL4-2025-03-DATA-08: Large-scale pilots for supply end-to-end infrastructures integrating device, network computing and communication capabilities for Telco Edge Cloud deployments, as a basis for Connected Collaborative Computing Networks (3C networks) (RIA)	111
HORIZON-CL4-2025-03-DATA-09: Alignment of stakeholders towards the supply-side large-scale pilot of end-to-end infrastructures integrating device, network computing and communication capabilities (CSA)	117
HORIZON-CL4-2025-03-DATA-10: Roadmap for next generation computing technologies from IoT device level to edge to cloud to HPC (CSA)	119
HORIZON-CL4-2025-03-DATA-11: Open Internet Stack: development of technological commons/open-source 3C building blocks (RIA)	120
HORIZON-CL4-2025-03-DATA-12: Preparing the Advancement of the state of the art of submarine cable infrastructures (CSA)	123
AI-GenAI / Data / Robotics	126
HORIZON-CL4-2025-03-DATA-13: Fostering Innovative and Compliant Data Ecosystems (IA) (AI, Data and Robotics Partnership)	126
HORIZON-CL4-2025-04-DATA-02: Empowering AI/generative AI along the Cognitive Computing continuum (RIA) (AI/Data/Robotics Partnership)	129
HORIZON-CL4-2025-04-DATA-03: Software Engineering for AI and generative AI (RIA) (AI/Data/Robotics Partnership)	132

Destination 4: Achieving open strategic autonomy in digital and emerging enabling technologies	137
Quantum and High Performance Computing	138
HORIZON-CL4-2025-03-DIGITAL-EMERGING-01: Continuation of the Quantum Technologies Flagship (CSA)	139
HORIZON-CL4-2025-03-DIGITAL-EMERGING-02: Quantum Computing – complementing the quantum computing FPAs with the development of a technology agnostic software stack (RIA)	141
HORIZON-CL4-2025-03-DIGITAL-EMERGING-03: Supporting Digital Partnerships in Quantum technologies (RIA)	144
HORIZON-CL4-2025-03-DIGITAL-EMERGING-04: Post-exascale HPC (CSA)	146
Photonics	147
HORIZON-CL4-2025-04-DIGITAL-EMERGING-01: Advanced sensor technologies and multimodal sensor integration for multiple application domains (IA) (Photonics Partnership)	148
Semiconductors	151
HORIZON-CL4-2025-03-DIGITAL-EMERGING-08: Strengthening the fabless Start-up and SME ecosystem in Europe (CSA)	151
AI-GenAI / Data / Robotics	153
HORIZON-CL4-2025-03-DIGITAL-EMERGING-07: Robust and trustworthy GenerativeAI for Robotics and industrial automation (RIA) (AI/Data/Robotics & Made in Europe Partnerships)	153
HORIZON-CL4-2025-03-DIGITAL-EMERGING-09: Challenge-Driven GenAI4EU Booster (RIA) (AI/Data/Robotics Partnership)	160
HORIZON-CL4-2025-04-DIGITAL-EMERGING-04: Assessment methodologies for General Purpose AI capabilities and risks (RIA) (AI/Data/Robotics Partnership)	165
HORIZON-CL4-2025-04-DIGITAL-EMERGING-05: Soft Robotics for Advanced physical capabilities (IA) (AI/Data/Robotics Partnership)	168
HORIZON-CL4-2025-04-DIGITAL-EMERGING-07: Enhanced Learning Strategies for General Purpose AI: Advancing GenAI4EU (RIA) (AI/Data/Robotics Partnership)	170
Artificial Intelligence in Science	173
HORIZON-CL4-INDUSTRY-2025-01-DIGITAL-61: AI Foundation models in science (GenAI4EU) (RIA)	173
HORIZON-CL4-INDUSTRY-2025-01-DIGITAL-62: Facilitated cooperation for AI in Science (CSA)	178
 Destination 5: Open Strategic Autonomy in Developing, Deploying and Using Global Space-Based Infrastructure, Services, Applications and Data	 181
Heading 1 - Accessing Space	187
HORIZON-CL4-2025-02-SPACE-11: CSA on access to European spaceports	187
HORIZON-CL4-2025-02-SPACE-12: Digital solutions for autonomy for space transportation systems, design and simulation tools - Digital enablers and building blocks	188

HORIZON-CL4-2025-02-SPACE-13: Digital solutions for autonomy for space transportation systems, design and simulation tools – targeting demonstration	191
Heading 2 - Acting in Space	194
HORIZON-CL4-2025-02-SPACE-21: ISOS Pilot Mission Detailed Design – Servicing component	195
HORIZON-CL4-2025-02-SPACE-22: ISOS Pilot Mission Detailed Design – HOST component	199
HORIZON-CL4-2025-02-SPACE-23: ISOS Pilot Mission Detailed Design – Logistics component	203
HORIZON-CL4-2025-02-SPACE-24: ISOS Pilot Mission Detailed Design – satAPPs component	207
Heading 3 - Using Space on Earth - Telecommunications	210
Heading 3bis - Using Space on Earth – Telecommunications and Earth Observation	210
HORIZON-CL4-2025-02-SPACE-31: Digital enablers and building blocks for Earth Observation and Satellite telecommunication for Space solutions	210
HORIZON-CL4-2025-02-SPACE-32: Preparing demonstration missions for collaborative Earth Observation and Satellite telecommunication for Space solutions	213
Heading 4 - Using Space on Earth – Earth Observation	217
HORIZON-CL4-2025-02-SPACE-41: Copernicus Climate Change Service (C3S) evolution: new and innovative processing and methods for future Sentinels and other satellites for reanalyses.....	217
HORIZON-CL4-2025-02-SPACE-42: Copernicus Atmosphere Monitoring Service (CAMS) evolution: improved soil-vegetation-atmosphere modelling and data assimilation of atmospheric constituents	220
HORIZON-CL4-2025-02-SPACE-43: Copernicus Anthropogenic CO ₂ Emissions Monitoring & Verification Support (CO2MVS) capacity: new and innovative methods to estimate the impact of fires on vegetation and related carbon fluxes	222
HORIZON-CL4-2025-02-SPACE-44: Copernicus Marine Environment Monitoring Service (CMEMS) evolution: new and innovative ocean data assimilation techniques....	225
HORIZON-CL4-2025-02-SPACE-45: Supporting the AI/ML digital transition of Copernicus Services	227
HORIZON-CL4-2025-02-SPACE-46: Innovative Earth observation services in support of maritime litter detection and ship source pollution policies.....	231
Heading 5 - Using Space on Earth – Satellite navigation	234
Heading 6 - Using Space on Earth – Services & Data coming from satellites, both Earth Observation and navigation.....	234
Heading 7 - Monitoring Space	234
Heading 8 – Boosting Space through non-dependence of the EU for key critical space technologies.....	234
HORIZON-CL4-2025-02-SPACE-71: Space Critical EEE Components for EU non-dependence – RISC-V Microprocessor on 7nm.....	234
HORIZON-CL4-2025-02-SPACE-72: Space Critical Equipment and Related Technologies for EU non-dependence – Chip Scale Atomic Clocks and Solar Cells.....	238

HORIZON-CL4-2025-02-SPACE-73: Space Critical EEE Components for EU non-dependence - Connectors	242
HORIZON-CL4-2025-02-SPACE-74: Space Critical EEE Components for EU non-dependence – Advanced Packages and Memories	247
Heading 9 – Boosting Space through international cooperation	251
HORIZON-CL4-2025-02-SPACE-81: EU-Japan cooperation on the exploitation of Quantum Space Gravimetry data	251
Heading 10 – Boosting Space through training and education activities.....	253
Heading 11 – Boosting Space through IOD/IOV opportunities	253
Heading 12 – Boosting Space through support to entrepreneurship	253
Destination 6: Digital and industrial technologies driving human-centric innovation..	254
Virtual Worlds	256
HORIZON-CL4-2025-03-HUMAN-14: Core technologies for virtual worlds (RIA) (Virtual Worlds and Photonics Partnerships)	256
HORIZON-CL4-2025-03-HUMAN-15: GenAI4EU: Generative AI for Virtual Worlds: Advanced technologies for better performance and hyper personalised and immersive experience (IA) (AI/Data/Robotics & Virtual Worlds Partnerships)	259
HORIZON-CL4-2025-03-HUMAN-16: Drive the evolution of the internet towards open and interoperable Web 4.0 and Virtual Worlds: building blocks in priority areas (RIA) (Virtual Worlds Partnership)	262
HORIZON-CL4-2025-03-HUMAN-17: Specific support for the Virtual Worlds Partnership and the Web 4.0 initiative (CSA) (Virtual Worlds Partnership)	265
AI-GenAI / Data / Robotics	269
HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub (CSA) (AI/Data/Robotics Partnership)	269
Standardisation and Knowledge Valorisation	273
HORIZON-CL4-INDUSTRY-2025-01-HUMAN-60: Horizon Standardisation Booster (CSA)	273
HORIZON-CL4-INDUSTRY-2025-01-HUMAN-61: Standardisation landscape analyses tool (CSA)	275
HORIZON-CL4-INDUSTRY-2025-01-HUMAN-62: Artificial Intelligence for knowledge valorisation (CSA).....	277
HORIZON-CL4-INDUSTRY-2025-01-HUMAN-63: Value creation pilots for scaling up innovative solutions (CSA)	279
HORIZON-CL4-INDUSTRY-2025-01-HUMAN-64: Pilot initiatives on Technology Infrastructures (CSA)	280
HORIZON-CL4-INDUSTRY-2025-01-HUMAN-65: System innovation experimentation for Industry 5.0 (IA)	282
HORIZON-CL4-INDUSTRY-2025-01-HUMAN-66: Assessment of Technology Infrastructure needs in Ukraine (CSA).....	286
International Cooperation.....	288
HORIZON-CL4-2025-03-HUMAN-19: International cooperation in semiconductors (CSA)	288

HORIZON-CL4-2025-04-HUMAN-08: GenAI for Africa	289

Budget	338

Introduction

Progress in digital and industrial technologies, including in space, shapes all sectors of the economy and society. These technologies transform the way industry develops, create new products and services, and are central to any sustainable future. Research and innovation to support the green and digital transition, and attain and maintain strategic capacities such as Access to Space or Act in Space, are a key to Europe's competitiveness and open strategic autonomy, to industrial sustainability and to setting human-centred standards.

Resilience and technological sovereignty have become renewed priorities for the EU due to the current geopolitical and economic context that exposed vulnerabilities in critical value chains. In this context it is imperative to contribute to the implementation of the **Net-Zero Industry Act** (NZIA) and the **Critical Raw Materials Act** (CRMA); and to reinforce Europe's position in digital technologies, high-performance computing, Artificial Intelligence, robotics, secure communication, virtual worlds, critical Space technologies, advanced and sustainable manufacturing technologies, net-zero industry, sustainable raw and innovative materials, and the circular economy.

Cluster 4, 'Digital, Industry and Space' aims to shape competitive and trusted technologies for EU leadership in these technologies; to enable production and consumption respecting the boundaries of our planet; and to maximise the benefits for all parts of society in the variety of social, economic and territorial contexts in Europe. It will for example boost Europe leadership and competitiveness on Artificial Intelligence innovation (AI), leading the way on making AI safer and more trustworthy, and on tackling the risks stemming from its misuse. Similarly, it will ease the exploitation of untapped data potential while promoting high standards of data protection.

This cluster will serve the goals of the **Competitiveness Compass** through substantial R&I investments, often complemented by private investments through partnerships, across different technology readiness levels; and by integrating technological, environmental and social objectives into innovation.

This cluster will also support the **Clean Industrial Deal**, by driving decarbonisation and circularity in the manufacturing, energy-intensive and construction industries; and by providing the advanced materials and advanced manufacturing technologies that are needed for a net-zero economy. It aims to position the European Union as a technology and industrial leader in clean technologies.

Actions under this cluster will support key enabling technologies that are strategically important for Europe's future, and deliver on the following six expected impacts in the Strategic Plan, through matching destinations in this Work Programme.

In addition, several actions are crucial to support our European Economic Security Strategy, notably its 'promote' pillar that focuses on enhancing the Union's competitiveness and

industrial base, as well as investing in research and innovation for strategic and dual-use technologies.

Destination ‘Achieving global leadership in climate-neutral, circular and digitised industrial and digital value chains’

Destination ‘Achieving technological leadership for Europe's open strategic autonomy in raw materials, chemicals and innovative materials’

Destination ‘Developing an agile and secure single market and infrastructure for data-services and trustworthy artificial intelligence services’

Destination ‘Achieving open strategic autonomy in digital and emerging enabling technologies’

Destination ‘Open Strategic Autonomy in Developing, Deploying and Using Global Space-Based Infrastructure, Services in Space and on Ground, Applications and Data’

Destination ‘Digital and industrial technologies driving human-centric innovation’

Calls

Call - INDUSTRY

HORIZON-CL4-2025-01

Overview of this call¹

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)		Expected EU contribution per project (EUR million) ²	Indicative number of projects expected to be funded
		2025	2027		
Opening: 22 May 2025 Deadline(s): 23 Sep 2025					
Destination 1: Achieving global leadership in climate-neutral, circular and digitised industrial and digital value chains					
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-01: Integrated approaches for remanufacturing (Made in Europe Partnership) (IA)	IA	35.00		5.00 to 7.00	6
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-02: Physical and cognitive augmentation in advanced manufacturing (Made in Europe Partnership) (RIA)	RIA	35.00		4.00 to 6.00	7
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-05: Advanced manufacturing technologies for leadership of EU manufacturers in products for the net-zero industry (Made in Europe Partnership) (IA)	IA	42.00		5.00 to 7.00	6

¹

² Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

Horizon Europe - Work Programme 2025
Digital, Industry and Space

Partnership) (IA)					
HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-31: From heat-driven processes to the use of mechanical and electric forces (Processes4Planet partnership) (IA)	IA	25.00		8.00 to 10.00	3

General conditions relating to this call

<i>Admissibility conditions</i>	The conditions are described in General Annex A.
<i>Eligibility conditions</i>	The conditions are described in General Annex B.
<i>Financial and operational capacity and exclusion</i>	The criteria are described in General Annex C.
<i>Award criteria</i>	The criteria are described in General Annex D.
<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

Call - SPACE-HADEA

HORIZON-CL4-2025-02

Overview of this call⁴

Proposals are invited against the following Destinations and topic(s):

Topics	Type of Action	Budgets (EUR million)	Expected EU contribution per project (EUR million) ⁵	Indicative number of projects expected to be funded
		2025		
Opening: 22 May 2025 Deadline(s): 25 Sep 2025				
Destination 5: Open Strategic Autonomy in Developing, Deploying and Using Global Space-Based Infrastructure, Services, Applications and Data				
HORIZON-CL4-2025-02-SPACE-11: CSA on access to European spaceports	CSA	1.00	Around 1.00	1
HORIZON-CL4-2025-02-SPACE-12: Digital solutions for autonomy for space transportation systems, design and simulation tools - Digital enablers and building blocks	RIA	3.00	1.00 to 3.00	2
HORIZON-CL4-2025-02-SPACE-13: Digital solutions for autonomy for space transportation systems, design and simulation tools – targeting demonstration	IA	7.00	4.00 to 7.00	2
HORIZON-CL4-2025-02-SPACE-21: ISOS Pilot Mission Detailed Design – Servicing component	RIA	18.00	6.00 to 12.00	2
HORIZON-CL4-2025-02-SPACE-22: ISOS Pilot Mission Detailed Design – HOST component	RIA	17.50	12.00 to 17.50	1
HORIZON-CL4-2025-02-SPACE-23: ISOS	RIA	12.00	10.00 to	1

⁴ The Director-General responsible for the call may decide to open the call up to one month prior to or after the envisaged date(s) of opening.

The Director-General responsible may delay the deadline(s) by up to two months.

All deadlines are at 17.00.00 Brussels local time.

The budget amounts are subject to the availability of the appropriations provided for in the general budget of the Union for 2025.

⁵ Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.

<i>Documents</i>	The documents are described in General Annex E.
<i>Procedure</i>	The procedure is described in General Annex F.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G.

Destinations

Destination 1: Achieving global leadership in climate-neutral, circular and digitised industrial and digital value chains

The research and innovation under this Destination will continue to support a globally competitive European industry through the **twin green and digital transition**. The development of new and cross-cutting technologies will boost the transformation of existing value chains and the creation of new ones.

Supporting **net-zero manufacturing** is a key objective of the Net-Zero Industry Act and has a crucial role to play in the transition towards a green and sustainable society, going from ‘smart factory’ to a ‘smart sustainable value chain’. Smart manufacturing will help develop the materials and products needed to support net-zero and less polluting industries. There is much scope for improvement in circularity technologies applicable to different value chains, with special attention needed for product design, re-use, disassembly, remanufacturing/upgrading, recycling, and ‘Zero-X’ – zero defects, zero breakdowns and zero waste.

Digital technologies, like big data, advanced computing, and networking (including quantum), AI, robotics, photonics and the industrial virtual worlds will transform the practices of research, design and engineering, with better performing net-zero solutions and increased productivity in all sectors. Quick-response services can support hyperflexible production using, e.g. trustworthy AI and digital twins, with digitally enabled certification and qualification of processes and products.

In addition to decarbonisation, **energy-intensive industries** need to embrace the circular economy as a key pillar in the design of their value chains. This will be fundamental to their resource efficiency (in terms of materials, energy and water). Particularly important in this context is the innovative upcycling of secondary raw materials and waste and the development of sustainable and resource-efficient industrial processes.

The EU has set an ambitious goal for Europe to become the first climate-neutral continent by 2050. In some areas the key solutions for achieving significant reductions in emissions are already in the market. In crucial parts of the economy, as is the case for energy-intensive industries, many of the tools needed for such a significant reduction are still at an earlier stage of industrial or commercial development.

Further development and deployment of technologies identified in the ERA (European Research Area) industrial technology roadmaps for circular technologies and for low-carbon technologies will be essential to achieve this goal. Manufacturing processes, supply chains, cyber-physical systems or cities will become more climate neutral and less polluting, and circular solutions will include AI and digital twins, and the deployment of common European data spaces like those under the Digital Europe Programme.

Across industries, the human dimension (including gender differences) will be stressed via the **Industry 5.0 paradigm**.

To successfully move from **innovation to deployment**, a more effective transfer from small-scale industrial demonstrators to first-of-a-kind climate-neutral demonstrators is needed.

Business cases and exploitation strategies for industrialisation:

This section applies only to those topics in this Destination, for which proposals should demonstrate the expected outcomes by including a *business case and exploitation strategy for industrialisation*.

A business case and a credible initial exploitation strategy are essential components in the ultimate success of an industry-based project, as well as its prospects to attract further investments for deployment. They will both be decisive factors under the impact criterion, and proposers are encouraged to use the extended page limit to present a carefully considered business case and exploitation strategy, backed by the management of the companies involved.

The *business case* should demonstrate the expected impact of the proposal in terms of enhanced market opportunities for the participants and deployment in the EU, in the short to medium term. It should describe the targeted market(s); estimated market size in the EU and globally; user and customer needs; and demonstrate that the solutions will match the market and user needs in a cost-effective manner; and describe the expected market position and competitive advantage.

The *exploitation strategy* should identify obstacles, requirements and necessary actions involved in reaching higher TRLs (Technology Readiness Levels), for example: securing the required investments, including through possible synergies with other programmes; accessing the required skills; matching value chains; enhancing product robustness; securing industrial integrators; and user acceptance.

For TRLs 6 and 7, a credible strategy to achieve future full-scale deployment in the EU is expected, indicating the intentions of the industrial partners after the end of the project.

Where relevant, in the context of **skills**, it is recommended to develop training material to endow workers with the right skillset in order to support the uptake and deployment of new innovative products, services, and processes developed in the different projects. This material should be tested and be scalable, and can potentially be up-scaled through the European Social Fund Plus (ESF+). This will help the European labour force to close the skill gaps in the relevant sectors and occupational groups and improve employment and social levels across the EU and associated countries.

For topics in this destination, consortia (if selected for funding) could consider **voluntary contributions in terms of data, indicators and knowledge to relevant Joint Research Centre (JRC) platforms** for capitalising the knowledge developed in their projects and become more policy relevant:

- INnovation Centre for Industrial Transformation and Emissions (INCITE) (<https://innovation-centre-for-industrial-transformation.ec.europa.eu/>).
- The Energy and Industry Geography Lab: EIGL (<https://energy-industry-geolab.jrc.ec.europa.eu/>).

Innovation Actions — Legal entities established in China are not eligible to participate in Innovation Actions in any capacity. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

Manufacturing

Proposals are invited against the following topic(s):

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-01: Integrated approaches for remanufacturing (Made in Europe Partnership) (IA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 5.00 and 7.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 35.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 5 and achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: The manufacturing industry should benefit from the following outcomes:

- Enable an industrial ecosystem¹³ to double the volume of remanufactured components in the Union, compared to 2021, for the sectors and products considered;
- Stimulate new synergies for circularity in manufacturing industries;

¹³ notably ecosystems acknowledged under the European Industrial Strategies

- Increase significantly the capability in Europe to implement remanufacturing technologies for retaining, reusing, upgrading or adapting the function of products and components;
- Support skills and education capabilities for remanufacturing; and
- Support the development or revision of standards to better support remanufacturing.

These outcomes are also expected to benefit downstream applications in the net-zero industries.

Scope: Remanufacturing (including de-manufacturing) is the rebuilding of products using combinations of reused, repaired and new components. Remanufacturing aims to retain the usefulness of both products and components and is an essential step in achieving full industrial circularity. Ultimately, remanufacturing is expected to reduce the level of resource consumption, as well as the carbon footprint of products and logistic chains. Such approaches will strengthen industrial resilience by building up a remanufacturing capacity in Europe, including possible applications in net-zero technologies and components.

Proposals should demonstrate cutting-edge remanufacturing approaches, covering de-manufacturing and appropriate manufacturing technologies, model-based systems engineering, quality control and business models. Repurposing of products (at the level of systems or components) may also be considered. This approach calls for remanufacturing technologies at the factory level, as well as for their integration into circular value loops – within specific industrial sectors or across industrial sectors. In general, the approaches should integrate traditional manufacturing processes, such as additive manufacturing, machining and welding, with automation, robotics and digitalisation.

Recycling technologies for the generation of secondary raw materials are not within the scope of this topic.

Proposals should address all of the following:

- Remanufacturing technologies and processes and/or system engineering, building on advances in data sharing and AI;
- Mass de-manufacturing, such as disassembly, separation and sorting;
- Capability to produce high-quality products from a wide range of resources (new and remanufactured components and materials);
- Methodologies to facilitate decisions made at the end-of-use or end-of-life phase at the level of components or systems;
- Measurement, verification and inspection approaches assuring high quality, traceability and compliance with quality standards;

- Stringent data sourcing, interoperability and processing, coupled to robust AI technologies (leveraging on existing ontologies and through the implementation of the FAIR data principles¹⁴);
- International standards, building on existing standards or contributing to future standardisation, with a focus on remanufacturing standards; and
- New sets of skills required for remanufacturing implementation at the European level.

Proposals aiming to develop new products should additionally cover the design of these products for circularity. Points to consider in this case are prioritising the use of recyclable materials and recyclable or reusable components; and increased adaptability, exchangeability and lifetime of components.

Proposals should consider where relevant

- The EU regulatory framework, notably the Ecodesign for Sustainable Product Regulation¹⁵ and the EU waste/sectoral legislation¹⁶;
- The Ecodesign approach, especially the circular-by-design approach including modularity, reparability, adaptability and exchangeability of components as well as refurbishment and repurposing of products or components; and
- The Digital Product Passport: information about products along their overall lifecycle needs to be collected along the remanufacturing operations.

Proposals should include a business case and exploitation strategy, as outlined in the introduction to this Destination. It is essential that the business model address the entire lifecycle of remanufacturing, including logistics. They should assess the circularity and decarbonisation that can be achieved, as well as the economic case and competitiveness, and make a corresponding contribution to the standardisation of lifecycle performance metrics. Regarding decarbonisation, proposals should address the expected reductions in energy consumption and GHG emissions, and – where applicable – impact net-zero technologies and components.

Where relevant, proposals are encouraged to build on, or seek collaboration with, existing projects and develop synergies with other relevant European, national or regional initiatives and funding programmes. In particular, links are encouraged with

- the projects funded under earlier relevant topics, for example the topic on re-manufacturing, HORIZON-CL4-2023-TWIN-TRANSITION-01-04: Factory-level and value chain approaches for remanufacturing; or
- the Digital Europe programme, e.g. in the area of Manufacturing Data Spaces.

¹⁴ Turning FAIR into reality: https://ec.europa.eu/info/sites/default/files/turning_fair_into_reality_1.pdf

¹⁵ https://ec.europa.eu/environment/publications/proposal-ecodesign-sustainable-products-regulation_en

¹⁶ https://environment.ec.europa.eu/topics/waste-and-recycling/waste-law_en

To address the requirements above related to business models and to relevant skills (and where applicable to design), appropriate contributions from Social Sciences and Humanities (SSH) are indispensable. Where appropriate social partners or social innovation may be considered.

International cooperation is encouraged, especially with Japan or Taiwan.

This topic implements the co-programmed European Partnership Made in Europe.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-02: Physical and cognitive augmentation in advanced manufacturing (Made in Europe Partnership) (RIA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 35.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 5-6 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁷.</p>
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

¹⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: Manufacturing industry should benefit from the following outcomes:

- Empower workers at all levels in factories, both individuals and teams, through breakthrough augmentation technologies embodying the next stage in human-machine interactions;
- Enhance, with the help of these technologies and related contributions from Social Sciences and Humanities (SSH), the flexibility, inclusiveness, safety and well-being of workers in the industrial environment, leading to more attractive jobs in the EU, attracting and retaining talents from new generations (e.g. Generation Z);
- Foster the human-centric aspect of the Industry 5.0 model, through insights into how technology affects the working environment and the organisation, and into how technology can support the worker in their career (including the associated meaningful job profiles).

Scope: The rising complexity of discrete manufacturing operations requires workers to adapt to the introduction of new breakthrough technologies, machines, processes, and production environments (considering where appropriate legacy machinery). In addition, labour shortages are growing. The development of a human-centric culture that places the humans at the centre of the manufacturing operation is crucial. Augmentation technologies support and empower the workforce, leading to more high-quality jobs and prosperity beyond efficiency. They can relieve people of non-creative tasks or reduce human strain and stress and potential risks in the workplace. Augmentation technologies can therefore produce benefits for both workers and managers and can become the most effective ways of supporting, or amplifying, human abilities.

Proposals should develop breakthrough technologies to augment human capabilities and skills. Proposals should cover all of the following aspects:

- Develop breakthrough solutions (based on e.g. mechatronics, sensing and photonics) for human-centric approaches; these include innovative perception technologies to sense the shopfloor environment and to predict the intentions of humans, also leading to enhanced worker safety and reduction of discomfort, fatigue and physical and psychological stress;
- Develop innovative methodologies, potentially using AI, to provide reasoning capabilities and to control the behaviour of the manufacturing systems, to support humans and to interact and communicate with them; this will foster natural improvements in efficiency, sharing of knowledge, inclusiveness, accessibility and flexibility;
- Assess and take into account the needs of managers and workers, at the beginning of the design phase and throughout all stages up to the development of a prototype, ensuring that both workers and managers have the right skills to implement the innovative solutions and that the solutions take into account the variety of workforces;

- Develop new methodologies to perform an assessment of augmentation technologies and their suitability and value added (beyond economics) for workers in all their diversity.

Digital-twin models can be potentially used in the development of new assessment methodologies to perform validation in a virtual scenario.

The assessment methodologies may lead to new standards for the validation of the developed systems, or indicate how new or existing standards could benefit from a human-centric approach and how the developed systems could support this.

Proposals should take into account Social Sciences and Humanities (SSH) contributions regarding human-related barriers for the uptake of augmentation technologies in industrial environments, such as ergonomics, user experience, comfort, trust, feeling of safety, knowledge sharing and liability in modern production facilities. Proposals should specifically address gender, age, disability and other anthropometric and ergonomic considerations, and impacts across diverse demographic groups. Social partners (e.g. trade unions) may also be considered. Optionally, proposals may include test and experimentation environments such as living labs for validation.

Proposals should include a business case and exploitation strategy, as outlined in the introduction to this Destination (adapted to the expected TRL of this topic).

This topic implements the co-programmed European Partnership Made in Europe.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-05: **Advanced manufacturing technologies for leadership of EU manufacturers in products for the net-zero industry (Made in Europe Partnership) (IA)**

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 5.00 and 7.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 42.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by

	3 pages.
--	----------

Expected Outcome: The European Union's manufacturing industry should benefit from the following outcomes:

- Enhanced capabilities in the areas of strategic and high-value-added products for the net-zero industry; and
- Increased production capacity for clean technologies in the Member States and Associated Countries, diversifying supply sources, and ensuring high environmental standards.
- Contributions to reaching the targets set by the Net Zero Industry Act, in ensuring the reduction of strategic dependencies.

Scope: The net-zero industry relies on manufactured products, components and equipment.

The focus is on advanced discrete manufacturing processes for such products, components and equipment, which enable new product features (in terms of geometry, weight, robustness, functional integration, re-use-potential); advanced production processes including automation; or the use of innovative materials. The processes should improve productivity and upscaling, decrease waste, and shorten time-to-market and process integration times.

Proposals should address manufacturing technologies applicable to products for *at least one* of the strategic net-zero technologies listed in Annex I of the Net-Zero Industry Act:¹⁸

Proposals should address the key manufacturing technologies that generate cross-sectoral impact among the chosen net-zero technology sectors.

While operating in synergy with initiatives that focus on the design and engineering of strategic products and solutions, research and innovation should focus on the innovative development and application of one or more of the following manufacturing technologies and associated systems:

- Additive manufacturing or cladding for manufacturing and/or repair;
- Advanced joining technologies;
- Advanced forming and material shaping technologies;
- Surface processing technologies, functionalisation, nano- or micromanufacturing; and
- High-precision machining and assembly.

Proposals should consider integrating

- Innovative metrology and inspection methods, aiming at first-time right manufacturing;

¹⁸ https://ec.europa.eu/commission/presscorner/detail/en/qanda_23_1666

- Advanced and flexible automation approaches, for instance for large components, complex assembling or handling of hazardous materials;
- Digital twins and data mining for fast ramp-up, scale-up and real-time optimisation of production;
- Circular manufacturing approaches and reduced reliance on Critical Raw Materials, in view of increasing the options for re-manufacturing, disassembly, recycling, etc.; and
- Relevant skills and standards.

In addition the overall environmental impact of the manufacturing processes should be minimal in terms of energy and resource consumption and CO₂ emissions.

Proposals should include a business case and exploitation strategy, as outlined in the introduction to this Destination. The aspect of manufacturing in the Union is particularly important in this topic.

The attention of proposers is also drawn to the complementary topic HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-34: Smart integration of net zero technologies into Energy Intensive industries. Technologies covered by that topic are not in the scope of this topic.

This topic implements the co-programmed European Partnership Made in Europe.

Construction

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-05-TWIN-TRANSITION-11-two-stage: Enhanced logistics and operations of construction sites (IA)

Call: INDUSTRY two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 6.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 13.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Admissibility conditions</i>	The conditions are described in General Annex A. The following exceptions apply: Applicants submitting a proposal under the blind evaluation

	pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 5 and achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹⁹ .
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome:

- Reduce the time taken to carry out site operations of construction or demolition works;
- Increase the application of on-site circular approaches such as re-use, preparing for re-use and recycling, resulting in reduced waste generation and improved waste management;
- Improve health and safety of construction workers.

Scope: Construction works on the building site, whether for civil infrastructure or for buildings, often involve a variety of complex operations apart from the actual assembly of elements. These can include transport and movement of construction products to and around the site; storage of products, materials and other items on site, and their eventual removal;

¹⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

dealing with packaging of products and other consumables related to the construction works; temporary accommodation for workers; temporary utility connections and associated works; planning of works; coordination of trades and operations, including machines as well as human workers. Mistakes and delays in construction works can lead to negative consequences such as risk of accidents, waste, pollution, inefficiency and financial consequences.

Construction works need to be carried out more quickly and efficiently, with less room for error and waste. This could be improved through technology-driven innovations linked to on-site operations and logistical aspects.

Proposals should:

- Develop technologies that improve the efficiency of operations on the construction site, leading to more productive, faster and more efficient working practices. The technologies should be interoperable with, or build upon existing industry-wide practices, such as Digital Twins and Building Information Modelling tools. Speed and efficiency improvements should not be at the expense of safety.
- Address the traceability of construction products and other items delivered to the site, installed on site, and removed. If relevant, this can also include coordination with other operations outside the construction site boundary.
- Integrate circular economy approaches, such as waste prevention and the management and recovery of construction and demolition waste;
- Address new ways for site operations to reduce the chances of errors and accidents/taking better account of unexpected disruptions;
- Address human-centric and Social Science and Humanities (SSH) aspects of technologies or tools that are developed. Take into consideration potential social innovation mechanisms that can facilitate the market uptake of the developed tools.

Proposals should include a business case and exploitation strategy, as outlined in the introduction to this Destination.

Proposals may choose to contribute to relevant European standardisation efforts. Proposals should seek to build synergies with relevant other work, for example, EU-funded projects under the New European Bauhaus Facility, or Horizon Europe partnerships including Built4People.

Energy-Intensive Industries - Decarbonisation and Energy Efficiency

Proposals are invited against the following topic(s):

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-31: From heat-driven processes to the use of mechanical and electric forces (Processes4Planet partnership) (IA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 8.00 and 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 25.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 7 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Energy Intensive industries will benefit from the following outcomes:

- Enable the integration of renewable electricity in the process industries by transitioning from heat driven to direct electricity driven process units in a plant;
- Contribute to achieving the EU climate neutrality objective as well as proposed 2040 90% GHG reduction target²⁰;
- Achieve 25% energy savings compared to processes based on relevant Best Available Technologies;
- Improve the economic viability of the entire unit compared to the state-of-the-art heat-driven process and increase the competitiveness and resilience of the European process industry.

Scope: The generation of heat, which is often sourced from fossil fuel combustion, is the biggest consumer of energy in the process industries and responsible for 60% of process industries GHG emissions. Heat input is in particular commonly used in separation and drying processes. The topic focuses on the development of new electrically driven industrial processes where heat input in such processes is replaced by electro-mechanical power or other

²⁰

[2040 climate target - European Commission \(europa.eu\)](https://european-council.europa.eu/media/e3001c7d-326d-476a-962d-694c206c860f/en/attachment/data/2020/02/2040-climate-target.pdf)

forms of direct electrical input. These electrified processes could represent a major reduction of GHG emissions as well as an important source of energy savings. The scope does not include conventional electric heating or the use of heat pumps.

Proposals under this topic should address all of the following:

- Demonstrate and/or integrate highly efficient electrically driven technologies e.g., membrane technology, power ultrasound, mechanical activation, mechanically or electricity induced forces, electrochemical processes, that can replace traditional heating processes;
- Demonstrate and evaluate energy efficiency gains;
- Prove the effectiveness of the technologies towards GHG emission avoidance;
- Take a holistic approach which may include aspects such as redesign of equipment, requirements for advanced materials and integrated electrified processes;
- Ensure process safety, sufficient flexibility and ease of process control;
- Showcase improved CO₂ reduction potential, performance, scalability and cost efficiency of the proposed solution through, at least, one realistic use case that can be replicable with demonstrable economic return.

The inclusion of a GHG avoidance methodology²¹ is recommended and should provide detailed descriptions of baselines and projected emissions reduction.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination, underlining how the proposal will serve the purpose to boost industrial decarbonisation technologies supply chain in Europe. As project output an elaborated exploitation plan should be developed, including preliminary plans for scalability, commercialisation and deployment (feasibility study, business plan and financial model) indicating possible private and public funding sources (e.g. Innovation Fund, InvestEU and cohesion policy funds). Societal- and environmental impact as well as implications for the workplace (including skills and organisational change) should be outlined.

This topic implements the co-programmed European partnership Processes4Planet.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-32: Green and resilient flexible production processes (Processes4Planet partnership) (IA)

Call: INDUSTRY

²¹ That could follow Innovation Fund methodology: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/innovfund/wp-call/2021/call-annex_c_innovfund-lsc-2021_en.pdf

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 8.00 and 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 25.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Energy Intensive industries will benefit from the following outcomes:

- Increase significantly the process flexibility offering a step change in the capacity of individual production plants to promptly and frequently adapt to energy input variations over a significant range and with increased speed;
- Enable new flexible and efficient production processes, leading to economic and sustainability gains despite of volatile energy supply variations;
- Increase significantly raw material and energy efficiency while facing variations of the renewable energy input when compared to state-of-the-art industrial processes;
- Contribute to achieving EU climate neutrality objective as well as Commission recommendation of reducing EU GHG emissions by 90% by 2040 ²².

Scope: Flexibility of energy intensive production processes is a necessity for the use of alternative energy carriers as the supply of energy by renewable sources is subject to significant variations and the competitive potential of energy storage is limited. The optimal use of the renewable energy supply will require processes that can perform fast transitions to allow continuous and efficient operation when the renewable energy input varies. The limiting factor addressed by the topic is the ability of the production plants to promptly change loads and throughputs in large ranges without negative consequences for the equipment, while staying energy and resource efficient. Storage options and use of several sources of renewable energy can be included, the combination (hybridation) of various decarbonisation technologies can also be considered.

²²

[2040 climate target - European Commission \(europa.eu\)](https://european-council.europa.eu/media/e300147f-326d-4761-995d-6f8e50b3417c/attachment_data/data/e300147f-326d-4761-995d-6f8e50b3417c.pdf)

Proposals under this topic should address all of the following:

- Address the redesign and modification of existing processes, including, as relevant, modifications of process steps or equipment and smart combinations of renewable energy sources, thereby improving the overall operation flexibility of the process and resulting in continuous efficient operation;
- Propose redesign and modification of plants and processes to increase their flexibility response rate (e.g., faster ramp up or ramp down) while maintaining a high energy- and resource efficiency;
- Demonstrate and evaluate material and energy efficiency gains from a holistic view of the processing plants and the energy systems as well as economic benefits by exploiting the price variations on the energy markets;
- Showcase improved performance, scalability and cost efficiency of the proposed solution through at least one realistic use case at pilot scale;
- Define necessary skills of the proposed solution, to enable their industrial implementation.

Digital tools and advanced control to support the operation and the flexibility of the processes can be elements of a solution.

The inclusion of a GHG avoidance methodology²³ is recommended and should provide detailed description of baselines and projected reductions.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination, underlining how the proposal will serve the purpose to boost industrial decarbonisation technologies supply chain in Europe. As project output an elaborated exploitation plan should be developed, including preliminary plans for scalability, commercialisation and deployment (feasibility study, business plan and financial model) indicating possible private and public funding sources (e.g. Innovation Fund, InvestEU and cohesion policy funds). Societal- and environmental impact as well as implications for the workplace (including skills and organisational changes) should be outlined.

This topic implements the co-programmed European partnership Processes4Planet.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-33: Integrated use of renewable energy carriers in industrial sites (Processes4Planet partnership) (RIA)

Call: INDUSTRY

²³ That could follow Innovation Fund methodology: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/innovfund/wp-call/2021/call-annex_c_innovfund-lsc-2021_en.pdf

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 25.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5-6 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Energy Intensive industries will benefit from the following outcomes:

- Enable the integrated use of different types of renewable energy carriers in industrial sites²⁴ with the aim to provide a constant robust low-carbon and economic energy input to process industries;
- Pave the way for strategic industrial cooperation to cope with fluctuations of the energy inputs and to achieve overall energy and cost efficiency;
- Support stability and operational flexibility of the power grid, including implementation of storage solutions to buffer energy demand peaks;
- Enable the use of renewable energy labelling and documentation, scheduling of energy use and price compensation models to achieve optimal grid load;
- Improve the technical and economic feasibility of the integrated use of renewable energy carriers in industrial sites compared to other solutions with a similar CO2 reduction potential.

Scope: There is a broad range of renewable energy carriers (e.g., electricity, hydrogen, solar heat, ammonia, etc) which can be utilised in the process industries. Many of them are provided with significant temporal variations, e.g., renewable electricity and solar heat. Integrated design and operation of these highly complex systems within process industry sites are needed to cope with the fluctuations of the energy inputs and to achieve overall energy

²⁴ Industrial sites refers to industrial clusters, hubs, parks formed by several plants of the energy intensive industries. Large individual plants may be considered in those sectors where plants are not typically integrated in industrial sites.

and cost efficiency. Industrial symbiosis and integration of production systems with energy systems in industrial sites can ensure overall emission reduction. These approaches can increase the efficiency of generation and enable solutions that avoid losses, supporting stability and efficiency of power systems.

Proposals under this topic should:

- Develop highly efficient technologies for, and prototype designs of, integrated structures of industrial sites, including storage elements and solutions for their integrated operation under varying conditions;
- Take due account of logistic aspects, risk assessment and management at plant level;
- Develop systemic solutions embracing industrial symbiosis, and if relevant, contribute to further evolution of existing Hubs4Circularity²⁵;
- Consider the interaction with the supply side, in particular electric power grids, hydrogen pipelines or district heating;
- Demonstrate full integration and use of advanced digital technologies from fields of distributed process control strategies, and data driven AI based optimisation and the application of model-based technologies for the improved, safe and efficient operation of industrial plants and sites, including the interaction with different grids;
- Demonstrate and evaluate energy efficiency and CO₂ footprint reduction by optimal integration of energy from renewable sources as well as providing demand side flexibility;
- Propose new ways to adapt the workplaces and organisation of site management to ensure that the solutions can be widely implemented.

Proposals should include energy efficiency, techno-economic and life-cycle assessment considerations of the overall process.

Proposals should consider representative real industrial sites demonstrating the solutions at least in open-loop computations. This should be done in parallel to the actual operation of the plants with validation of the benefits by simulations with accurate models. Experiments involving real industrial sites are encouraged.

Proposals should actively pursue involvement of all actors in the value chain, from industrial sites management to plant operators, and renewable energy providers. Interoperability as well as secure and trusted data sharing between stakeholders in the value chain should be considered, in accordance with the FAIR²⁶ data principles. Proposals submitted under this topic should include a business case and exploitation strategy (as outlined in the introduction

²⁵ [Hubs4Circularity \(h4c-community.eu\);Horizon Europe strategic plan 2025-2027-KI0223326ENN.pdf](https://hubs4circularity.eu/Horizon_Europe_strategic_plan_2025-2027-KI0223326ENN.pdf)
(page 94)

²⁶ Findable, Accessible, Interoperable, Reusable data

to this Destination) underlining how the proposal will serve the purpose to boost industrial decarbonisation technologies supply chain in Europe.

A strategy for skills development to master the challenges of such integrated systems should be included associating social partners. Attention should be given to using results from existing initiatives that have developed education and skills development concepts in this area.

This topic implements the co-programmed European partnership Processes4Planet.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-34: Smart integration of net zero technologies into Energy Intensive industries (Processes4Planet and Made in Europe partnerships) (IA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 5.00 and 9.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 25.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Manufactures of net zero technology solutions, as well as energy intensive industries will benefit from the following outcomes:

- Enable the sustainable and efficient use of energy in the energy intensive industries by bridging the gap between users and manufacturers of net-zero solutions for the energy-intensive industries.
- Foster win-win situations in which equipment manufactures co-create solutions with the energy-intensive industrial sectors opening new markets for the net-zero technologies;
- Develop new net-zero technologies industrially integrated processes that support the decarbonization of industry and offer new market opportunities;

- Enhance competitiveness of the European Energy Intensive and manufacturing industries;
- Accelerate the adoption of net-zero technologies in the energy intensive industries.

Scope: As the industry decarbonises net-zero technologies²⁷ can be applied to a wide range of energy intensive sectors and processes. Furthermore, the Net-Zero Industry Act which is part of the Green Deal Industrial Plan, is aiming at increasing the manufacturing capacity of strategic net-zero technologies to meet at least 40% of the EU's annual deployment needs. In this framework the aim of this topic is to accelerate the deployment of net-zero technologies in at least one industrial sectors through a closer collaboration between, net-zero technology manufacturers and energy intensive industries.

Proposals under this topic should address several of the following:

- Facilitate collaboration between at least one energy intensive industrial sector, with manufacturers of net-zero technology solutions, as well as where relevant engineering, and construction firms for the smart integration of one or several net-zero technologies in specific processes. Several energy intensive industrial sectors can be considered if they share similar processes and energy related needs;
- Assess the needs of the proposed industrial sector(s) to define 'standard' process(es) and assess operational energy needs through a closer exchange with net-zero technology manufacturers and suppliers in order to effectively design sustainable and cost-efficient energy solutions;
- Optimise and adapt technologies, products and solutions proposed by manufacturers of net zero technologies to meet the industrial sector needs;
- Propose and demonstrate the necessary modifications of processes for the efficient and flexible incorporation and the integration of net zero technologies in existing industrial plants;
- Demonstrate the effectiveness and replicability of the proposed approaches allowing to move from custom-built project by project approach for each specific industrial plant and process, to more streamlined, standardised yet flexible solution for industrial sector(s) and/or processes;
- Develop solutions offering an optimal balance between standardisation and flexibility as well as providing high-quality tailored solutions at competitive prices;
- Support the development of skills for the integration of net-zero technologies into energy intensive industries.

²⁷ Net-zero technologies as defined in the Net Zero Industry Act, Annex I: Strategic Net-zero Technologies

Proposals should involve all actors in the value chain from the manufacturers of net zero technology solutions to energy intensive industries and engineering and construction firms. Interoperability and secure and trusted data sharing between the stakeholders of the value chain should be ensured.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination. As project output an elaborated exploitation plan should be developed, including preliminary plans for scalability, commercialisation and deployment (feasibility study, business plan and financial model) indicating possible private and public funding sources (e.g. Innovation Fund, InvestEU and cohesion policy funds). Societal- and environmental impact as well as implications for the workplace (including skills and organisational changes) should be outlined. Proposals should ensure dissemination and replication of the proposed approaches for wide deployment, including advising and building capacity among the relevant actors. Proposals should be based on a sound techno-economic analysis that confirms the economic viability in view of evolving regulatory frameworks.

The inclusion of a GHG avoidance methodology²⁸ is recommended and should provide detailed description of baselines and projected reductions.

The attention of proposers is also drawn to the complementary topic HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-05: Advanced manufacturing technologies for leadership of EU manufacturers in products for the net-zero industry.

This topic implements the co-programmed European partnerships Processes4Planet and Made in Europe.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-37: Solving issues in carbon-neutral iron and steel making processes with diverse input materials of varying quality (Clean Steel Partnership) (RIA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 14.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 28.00 million.
<i>Type of Action</i>	Research and Innovation Actions

²⁸ That could follow Innovation Fund methodology: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/innovfund/wp-call/2021/call-annex_c_innovfund-lsc-2021_en.pdf

<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: The topic enables a fast and reliable transition to innovative technology pathways for carbon-neutral iron and steel making by tackling fundamental problems and boundary conditions with a system-level approach. This approach will target input materials, processes, and iron /steel output quality, considering the needs to reduce production costs, find alternative materials and solutions, improve process/energy efficiency and achieve at least the traditional product quality.

Iron and steel making plants constitute complex systems where the product quality is bound to a large set of variables. Variations in feedstock composition, along with reductant choice and mix, introduce noticeable variations in process metallurgy, its kinetics and thermodynamics, with influence on the morphology of the intermediates and consequent impact on the next phases of production, and lifetime, quality, safety and reliability of the finished product.

The strong dependence of the final steel quality on the variable quality of the raw materials and the balance of the production process, has to be taken into account under the consideration of costs, energy availability, sustainability, overall and specific energy efficiency, CO₂ emissions and strategic resources (in particular strategic raw materials²⁹).

Projects are expected to contribute to at least three of the following outcomes:

- Validate innovative carbon-neutral iron and steel making solutions within a system-level approach and in consideration of diverse materials with varying quality (raw input materials and reductants mix) and energy needs. Address high-risk factors at macroscopic and microscopic level through detailed characterisation of the physical and chemical interactions that could compromise the optimal functioning of the processes;
- Solve system-level issues within at least two low-CO₂ production routes;
- Define solutions and provide concepts to address possible modifications or material substitutions in innovative installations for low CO₂ iron and steel production;
- Improve low-CO₂ steel production reliability to target high-quality products: i) clarify the effect of material and process variables, and overall system aspects; ii) clarify the influence of changing crude steel quality on the properties of the produced steel, with the purpose to achieve quality and extended lifespan of products; iii) clarify the impact of diverse input materials with varying quality on the residue characteristics and on its potential valorisation and use;

²⁹

<https://www.consilium.europa.eu/en/infographics/critical-raw-materials/>

- Provide an impact analysis covering the materials and energy balance of identified solutions, viability and byproducts.

Scope: The topic calls for collaborative approach between academia, industry (including SMEs) and research organizations with the purpose to support: i) understanding, validating, and solving essential problems to allow maturity of innovative technologies in the industrial investment panorama for future carbon-neutral iron and steel making, ii) accelerating a reliable transition to climate neutrality in view of the end of the free ETS allowances by providing solutions optimized for different scenarios, and iii) fulfilling the Commission Recommendation 2024/774³⁰ on a Code of Practice on industry-academia co-creation for knowledge valorisation.

Proposals should address at least four of the following points:

- De-risk and extend operational windows of low CO₂ iron- and steel making technologies considering system-level scenarios;
- Target the heterogeneity of available reductants and feedstock materials, their different physical states and the mixed use of them. In this context, the sustainability of the process to produce them should be considered, along with the requirements for various grades of purity;
- Achieve high-quality steel products characterized by increased tolerances of contents of contaminants, originating from low quality raw materials. Adapt the micro-structure and control application-specific properties by acting on material preparation, processes and process technologies. Include the development of detection / measurement systems and multi-scale models as needed;
- Analyse, micro- and/or nano-characterise, and compare low-carbon production of liquid iron and/or crude steel combining the use of direct reduced iron (DRI) with varying qualities and raw materials from primary and secondary sources to push for closing material cycles;
- Couple the analysis with needs for plant design optimisation and measures to mitigate risks during operation;
- Define pre-processing needs of primary and secondary iron containing materials for iron and steelmaking targeting low environmental impact. Analyse the effects on the production process and product metallurgy;
- Consider analytical research infrastructures. Data should be supporting simulations- and modelling needs in line with FAIR (Findability, Accessibility, Interoperability and Reusability) principles. Interoperability of data sharing should be addressed;

³⁰

https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=OJ:L_202400774

- Consider effects of solutions indicated in the outcomes of the proposed project on specific regional or country level conditions, including cross-sectorial scenarios, such as energy availability, water use and recovery of water and other resources from the steelmaking process to use in other industrial sectors and vice versa, where applicable;
- Use tools such as, but not limited to, life cycle assessment (LCA) or life cycle costing (LCC) to create benchmarks for progress measurement towards carbon neutrality;
- Aim at taking advantage of pilot plants in Europe to create correlations between real-world processes and laboratory-based research.

Multidisciplinary research activities should address at least one of the following:

- Introduce sensors or develop new ones, especially able to work in very high temperature environments. They may include a soft and integrated set of sensors. Use fast digital techniques for data collection, processing and analysis. Develop enhanced models with different levels of resolution and integrate Machine Learning (ML)/AI for comprehensive understanding of process mechanisms;
- Use input from finalised/ongoing research in heat recovery via heat exchange technologies that could contribute to reduction of external energy use;
- Develop concepts for on-site hydrogen production techniques at very low cost.

Proposals submitted under this topic should include a business case and exploitation strategy, for at least one process route, as outlined in the introduction to this Destination. If more than one process route is part of the project, the selection of the preferred one should be duly justified.

Additionally, a strategy for skills development to target innovative solutions should be presented, associating social partners when relevant.

The actions should envisage clustering activities with other projects funded under this topic. Cross-projects co-operation should include consultations and joint activities on cross-cutting issues and share of results not bound to intellectual property, as well as participating in joint meetings and communication events. To this end proposals should foresee a dedicated work package.

Projects (if selected for funding and if relevant) could consider clustering activities with one project funded under topic HORIZON-CL4-INDUSTRY-2025-01-DIGITAL-61.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

This topic implements the European co-programmed Clean Steel Partnership.

Energy-intensive Industries - Circularity and Zero Pollution

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-05-TWIN-TRANSITION-35-two-stage: Developing and embedding upcycling technologies into viable business (Processes4Planet partnership) (IA)

Call: INDUSTRY two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 8.00 and 12.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 48.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants submitting a proposal under the blind evaluation pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 7 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p> <p>To ensure a portfolio including support leading to the recovery and upgrading of industrial infrastructure in Ukraine, grants will be awarded to applications not only in order of ranking, but also to at least one project involving at least one non-profit partner and at least one industrial partner established and located in Ukraine, provided that the application attains all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply:

	Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ³¹ .
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Energy Intensive industries will benefit from the following outcomes:

- Prove the technical, economic, and environmental feasibility of the upcycling of end-of-life waste materials by process industries in integrated circular schemes – including for supplying the value chains of net zero technologies and components;
- Enable doubling the ratio of secondary raw materials upcycled leading to a significant increase in resource, including energy efficiency and improved carbon lifecycle across the value chain compared to present levels;
- Increase the competitiveness of the European process industry, including by providing new business opportunities and revenue flows for recycling companies benefiting particularly SMEs – including for supplying the value chains of net zero technologies and components;
- Foster the use of digital tools as well as the data sharing, and FAIR (Findability, Accessibility, Interoperability and Reusability) digital assets principles.
- As appropriate in one or more projects, contribute to the reconstruction, recovery, circularity and upgrading of industries of Ukraine.

Scope: The recycling of end-of-life materials into valuable materials that can replace primary raw materials requires integrated systems from the collection to dismantling and separation to their final processing. The technologies and implementation (including logistics and economics) of such circular schemes should be addressed in an integrated way. The innovation needed will depend on the addressed waste category. However, even if the upcycling technologies and implementation may be sector/material specific, the cross-sectorial elements are important and should deserve due attention.

Proposals are expected to address all of the following:

³¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Develop processes for the upcycling of end-of-life materials in an integrated way, including the development of better novel separation, sorting and processing technologies as well as digitalisation and automation of the processes as necessary;
- Integration of technologies and logistics systems into business models of circular schemes;
- Focus on processes and secondary raw materials which offer the highest additional upcycling potential and accordingly develop novel upcycling technologies and processes including purification technologies;
- Identify the likely impacts of the upcycling solutions with respect to economic and job creation potential, as well as environmental footprint referring to the full set of planetary boundaries including freshwater intake aspects;
- Where relevant, minimise the presence of substances of concern to mitigate the impacts of multiple recycling loops as well as the accumulation of additives and trace materials in secondary resource streams;
- Consider advanced monitoring and sensing along the value chains and improved data completeness, accuracy and interoperability between the process and recycling companies. In this context, digital tools, such as a Digital Product Passport for tracking and tracing of materials throughout the lifecycle of a product should be applied and data sharing should be addressed.

Proposals should include techno-economic and life-cycle assessment of the overall process (including of the carbon footprint) and demonstrate the economic viability of the approach. This can be combined with an analysis of the effect of regulatory changes and demand side stimulation measures.

Projects are encouraged to integrate existing Hubs4Circularity³² as nodes in the value chains. Proposals should actively pursue the involvement of all actors in the value chain from the process industry to designers, operators, formulators, recyclers, public authorities, and standardisation actors.

Additionally, a strategy for skills development should be presented associating social partners where relevant. Particular attention should be given to the cooperation with existing initiatives having developed education- and skills activities and outcomes in this area.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination, underlining how the proposal will serve the purpose to boost industrial decarbonisation technologies supply chain in Europe.

Under this topic, it is envisaged to include support for the recovery and upgrading of industrial infrastructure in Ukraine, and for this reason at least one proposal meeting the

³² [Hubs4Circularity \(h4c-community.eu\)](https://hubs4circularity.eu/), [Horizon Europe strategic plan 2025-2027-KI0223326ENN.pdf](#) (page 94)

criteria set out in the specific conditions will be funded. However, it is not mandatory to include such support in a proposal.

This topic implements the co-programmed European partnership Processes4Planet.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-36: Safe and clean processing technologies and products (Processes4Planet partnership) (RIA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 24.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 4-6 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ³³ .
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Energy Intensive industries will benefit from the following outcomes:

³³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Reduce the use of hazardous substances in production processes and materials that pose a risk for human- and environmental health and safety, and ensure the avoidance of their proliferation into products;
- Enable novel processing technologies and materials with reduced health, safety, and environmental impacts;
- Increased knowledge on the industrial emission releases when it comes to emerging and less known groups of hazardous pollutants not regulated at EU level;
- Reduce the occupational exposure risk and negative health impacts at work by empowering employees;
- Contribute to the clean air and potentially biodiversity objectives, through the outcomes above.

Scope: Whereas the release of pollutants by European industry has generally decreased during the last decade, and it is expected to continue to do so, industry still contributes significantly to the emission of many pollutants into the European environment. Pollution harms our health and our environment. In addition to affecting people's health, pollution is one of the main reasons for the loss of biodiversity. Moreover, only emissions of historically important pollutants are reported by industry. Information on emerging and less known pollutants, especially those not regulated by the Industrial Emissions Directive, and related methods of monitoring is lacking. GHG emissions from industry are not included in the scope of this topic. Pollutant emissions to air, water and soil are considered.

Proposals under this topic should address all of the following:

- Demonstrate the reduction of the use of hazardous substances that pose a risk for human- and environmental health and safety and thereby also their proliferation into the products;
- Develop novel processing technologies leading to reduced health, safety and environmental impacts beyond CO₂ emissions;
- Minimise adverse effects from the novel processes' technologies on the function and durability of the materials, recyclability, the production cost as well as the associated risk;
- Where relevant, develop sampling and monitoring methods for emerging pollutants and less known groups of pollutants in stack emissions before entering the environment.

Proposals should include techno-economic and life-cycle assessment considerations of the overall process. They should consider involving all the relevant actors in a participatory approach for the reduction of risk and health issues at work.

Research should build on existing standards, or if relevant, contribute to standardisation, especially when addressing pollutants that lack robust monitoring methods. Where relevant, interoperability for data sharing should be addressed.

Proposals submitted under this topic should include a business case and exploitation strategy as outlined in the introduction to this Destination.

If selected for funding, projects are encouraged to build on, or seek collaboration, with existing projects and develop synergies with other relevant European, national, or regional initiatives and funding programmes. Where relevant, projects are encouraged to take advantage of European research infrastructures and services in the areas of analytical research infrastructures such as the ones in the ARIE network³⁴ or environment, health and food³⁵. Projects are moreover encouraged to inform the European Commission's Joint Research Centre (JRC) of their work plan to foster coordination with on-going science-for-policy related activities in the European Commission.

International cooperation is encouraged.

This topic implements the co-programmed European partnership Processes4Planet.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-38: Synergies and mutual learning with national and regional initiatives in Europe on Industrial decarbonisation (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 1.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 1.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the

³⁴ <https://arie-eu.org/>

³⁵ <https://ri-portfolio.esfri.eu/>

	Research and Training Programme of the European Atomic Energy Community (2021-2025). ³⁶ .
--	--

Expected Outcome:

- Increased cooperation across Member States and Associated Countries related to European, national and regional initiatives in the field of decarbonisation of energy - intensive industries in the context of a R&I deployment agenda.
- Support the implementation of the part on accelerating the decarbonisation of energy-intensive industries of the ERA Action on “*Accelerating R&I investments for Europe’s industrial Transformation and Competitive Sustainability*” featuring in the 2025-2027 ERA Policy Agenda.
- Exchange of best practices across Member States and Associated Countries on industrial decarbonisation projects and initiatives under the ERA Action and in the context of a R&I deployment agenda.
- Contribute to the Coordination of actions under the ERA Action and relevant work streams under the SET-Plan.
- Facilitate the development of new and update of existing national and regional industrial decarbonisation roadmaps, strategies, and action plans on energy intensive industries of countries participating in the ERA Action as well as under the SET Plan.
- Make available relevant national and regionally funded projects on the European Innovation Centre for Industrial Transformation and Emissions (INCITE)-Platform in line with a methodology developed by the Joint Research Centre in cooperation with other Commission services.

Scope: The governance of the action should be under the authority of national and regional governments and relevant public bodies who are responsible for national and regional policies, strategies and programmes addressing energy intensive industries.

Proposals should support the coordination of national and regional public authorities’ funding of research, innovation, acceleration of public/private R&I and deployment of technologies for the energy intensive industries’ decarbonisation. It should be aligned with the policies rolled out under the Clean Industrial Deal. The proposals should take into account and build on the Mutual Learning Exercise on Industrial Decarbonisation³⁷.

Coordination and support activities should address all of the following:

³⁶ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

³⁷ [Mutual Learning Exercise on Industrial decarbonisation | Research and Innovation \(europa.eu\)](#)

- Promote and organise active networking, exchanges of information and mutual learning and the application of a whole-of-government approach, involving national and regional authorities.
- Build an overview of national and regional technology roadmaps, strategies, and action plans on industrial decarbonisation.
- Compare this overview to relevant work at European level, including the ERA Industrial Technology Roadmap for low carbon technologies in energy-intensive industries, the updated SRIAs of the Processes4Planet and Clean Steel Partnerships, activities under the Innovation Funds, the SET-Plan, and the Net Zero Industry Act (and its and implementing acts), as well as the 2020 Taxonomy Regulation and its implementation as regards climate mitigation³⁸.
- Build and exchange knowledge and expertise in national and regional industrial decarbonisation roadmapping for low-carbon technologies in energy-intensive industries; and develop monitoring tools and identify indicators to monitor progress.
- Promote the valorisation of knowledge and results of EU, national and regional projects, in line with the Council conclusions³⁹ on knowledge valorisation of 23 May 2024.
- Implement the action through analytical work, providing information and data, workshops to facilitate collaboration among countries participating under the energy intensive industry part of the ERA Action and relevant working parties under the SET Plan among others.

HORIZON-CL4-INDUSTRY-2025-01-TWIN-TRANSITION-39: Towards human-centric, sustainable and resilient energy-intensive industries (Processes4Planet and Clean Steel partnerships) (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant</i>	The rules are described in General Annex G. The following exceptions apply:

³⁸ Commission Delegated Act 2021/2139 as regards the relevant parts of section 3 on manufacturing
³⁹ <https://data.consilium.europa.eu/doc/document/ST-10182-2024-INIT/en/pdf>

<i>Agreements</i>	Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ⁴⁰ .
-------------------	--

Expected Outcome: Proposals should contribute to the following outcomes:

- Facilitate radical workplace innovation, optimising human-machine interactions and capitalising on the added value of human workers via digital technologies;
- Contribute to the development of innovative technologies in a human-centric way while reducing the risk and negative health impacts at work;
- Incorporate new breakthrough technologies and realise new production processes with respect to human-centric design, environmental- and societal impacts and resilience;
- Improve the capacities of actors to integrate Industry 5.0 (human-centricity, sustainability, and resilience) in the technological development processes by at the same time increasing the competitiveness of the industry.

Scope: Industry 5.0 recognises the power of industry to achieve societal goals beyond jobs and growth to become a resilient provider of prosperity. It focuses on making production respect the boundaries of our planet improving competitiveness of European process industries and placing the wellbeing of the industrial worker at the centre of the production process, while increasingly embracing digital and green technologies to remain the solution provider for all Europeans.

Coordination and support activities should address all of the following:

- Prepare an overview of the state of the preconditions for adding the Industry 5.0 perspective to energy intensive industries - this includes human-centric, gender-specific, resilience and sustainability aspects;
- Map technologies (e.g., industrial wearable, human digital twin, extended reality) integrating individual competences and increasing usability, specifically applicable to energy intensive industries sectors and processes. For example, technologies i) supporting the co-design of processes and workplaces, enhancing the remote monitoring experience and creating new capabilities for operating; ii) supporting new forms of human-machine interaction by providing real-time feedback on personal performance

⁴⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

and holistic intuitive workplace interfaces; or iii) co-designed in accordance with user expectations and the integration of workplace experience;

- Explore through a practical assessment how the process automation technologies currently in use in Process Industries are making use of innovative the industry 5.0 technologies (the practical assessment is expected to cover several companies and at least five industry sectors);
- Develop an Industry 5.0 framework and engage with a wide range of stakeholders including labour authorities and ongoing relevant sectoral social dialogues at European level. This should include empower employees in a participatory approach for adding the industry 5.0 dimension to the industrial processes including the reduction of risk and health issues;
- Dissemination and communication of information and knowledge to stakeholders including industry, policy makers, research and education actors, civil society and general public;
- Proposals should specifically address gender, age, and disability considerations, recognising potential variations in technological adoption and impact across diverse demographic groups.

This topic implements the co-programmed European partnerships Processes4Planet and Clean Steel partnerships.

Social Circular Enterprises

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-05-TWIN-TRANSITION-21-two-stage: Demonstrators for clusters of social circular enterprises (IA)

Call: INDUSTRY two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Admissibility conditions</i>	The conditions are described in General Annex A. The following exceptions apply: Applicants submitting a proposal under the blind evaluation pilot (see

	General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ⁴¹.</p>

Expected Outcome: Social Circular Enterprises (SCEs)⁴² need to adapt to new market realities in the circular economy, driven by the search for new market opportunities (e.g. secondary raw materials market, business models addressing change in consumption awareness, and technological developments improving productivity). To achieve this adaptation, investment in R&D capacity and technology for SCEs is essential. Besides further developing its offer towards consumers, SCEs are increasingly focussing their activities towards B2B markets, such as for secondary raw materials. In that regard, SCEs started to explore the growing and labour-intensive market of sorting, recycling and upcycling services for other businesses. Research and innovation can accelerate this potential and is most needed in the area to remain competitive. Moreover, research and innovation in this sector can lever potentials beyond productivity and competitiveness, as SCEs pursue a triple impact: economic, green (contribute to a circular and resource efficient economy) and social (employment of vulnerable groups).

The following outcomes are expected for SCEs and wider circular networks:

- Improve the uptake and scale of technology solutions in individual SCE and promote shared technology development and engineering through SCE clusters.
- Improve competitiveness through enhanced productivity, as well as new market opportunities, for SCEs related to specific waste streams with potential for competitive

⁴¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁴² https://circulareconomy.europa.eu/platform/sites/default/files/social_circular_economy_2017.pdf

advantages, such as, textiles, WEEE (waste electrical and electronic equipment) and construction materials;

- Prove technical, economic, and environmental excellence of SCE in (local) circular value chains (e.g. I-US) leading to increased collaboration with (mainstream / for profit) industrial partners;
- Contribute to the reduction of non-recyclable waste generated in the region/area of the cluster by contributing to the re-using and transforming waste, by-products, and side-streams into new/secondary resources of raw materials;
- Increase employment of persons with a distance to the labour market in SCE and improve their labour productivity, for example by using assistive technology in the work process and use of data (e.g. AI trained assessment and instructions).

Scope: Social Circular Enterprises (SCEs) have been pioneers in the circular economy since decades. They are active in all stages of the circular economy and deal with various waste stream. SCEs are also known to offer new and innovative circular business models and bringing new circular services and products to the market. In the last decade SCE also entered the market of secondary raw materials by collecting and disassembling various products and goods. The majority of SCEs are SMEs and offer local employment opportunities to vulnerable groups (99%)⁴³. On average, a circular social enterprise creates 70 jobs per 1,000 tons collected with a view of being re-used.

Projects are expected to research and develop a replicable tech-oriented demonstrator(s) within social circular clusters. Within a demonstrator, partners are expected to jointly adapt, design, test and implement relevant technology solutions. The following specific activities are expected within demonstrators:

- The demonstrators are supposed to organise as a Social Circular Tech Cluster allowing to pool resources and adapt, develop and test technology solutions. This will facilitate more business opportunities (tech based spin-offs) and sharing of expertise with relevant industries.
- A demonstrator consortium should be active in at least two Member States or Associated Countries and can choose to focus on textile and construction waste or WEEE. Each demonstrator consortium exists out of two or more clusters, each grouping individual SCEs (ideally with different degrees of maturity⁴⁴), for-profit circular companies (e.g. sectoral peers in secondary raw materials industries), research, and tech centres able to support SCE with relevant technology and research capacity. SCEs should form the core of the consortia, and should benefit directly from the interventions to improve their triple impact model. Public authorities and SCE federations could engage where appropriate. Demonstrator consortia should be transnational in order to compare pilots in different markets.

⁴³ Proximity and social economy industrial ecosystem. Annual Single Market Report 2021.

⁴⁴ https://social-economy-gateway.ec.europa.eu/about-social-economy_en

- Adapting, designing and developing technologies in SCEs needs should focus on optimising efficiency⁴⁵ in management and processing of waste streams and enlarge the potential market activity of SCEs in the circular economy (WEEE, textiles and construction focus). Relevant technologies should improve the productivity and innovation capacity within SCE and consequently the market position in the secondary raw materials markets. Technologies can include data driven technologies such as AI to improve sorting knowledge and decision making (screening based on automated recognition with cost-benefit analysis), software to standardise repair operations and instructions, improve stocks management and increase reuse sales by optimising the pricing system (e.g. automated value calculation of incoming materials and goods), digital modelling tools (including material passport), etc.
- Research could also include the potential of assistive technologies to support employees (mostly persons with disabilities, specific impairments, or social disadvantages) in SCE in order to improve their productivity and wellbeing.
- Market research focussing on improving the position of SCE as an attractive partner in management and processing of waste streams (in terms of textile, WEEE and construction materials) with most potential for growth in B2B markets. For example focussing on collection, disassembly, sorting, purification, concentration, recycling, exchanging or preparation, for the valorisation of waste to be used as feedstock for other plants and companies across sectors and/or across value chains. This market research can include specific sectoral assessment of economic potential for most labour-intensive circular activities.
- By organising through clusters, demonstrators are motivated to develop shared engineering activities (labs, strategies and shared technology) to make technology accessible for enterprises with less capacity and resources and to reduce overall costs for individual SCEs.
- Where relevant, proposals are encouraged to build on, or seek collaboration with, existing projects and develop synergies with other relevant European, national or regional initiatives and funding programmes. In particular, the project could build further on relevant knowledge, tools, methods and technology developed and applied within existing H4C (Clusters for Circularity) and its knowledge platform.⁴⁶

Destination 2: Achieving technological leadership for Europe's open strategic autonomy in raw materials, chemicals and innovative materials

The research and innovation under this Destination will contribute to a paradigm shift, as regards the availability, development, use and disposal of chemicals and materials. This is necessary to guarantee Europe's technological sovereignty and capacity to deliver on the twin green and digital transitions (it is thus strongly linked to the objectives of the Destination 'Achieving global leadership in climate-neutral, circular and digitised industrial and digital value chains').

To enable such a shift, an innovative, strong European R&I ecosystem for circular chemicals and materials is needed, working across different technology readiness levels. Bringing knowledge and skills together across the materials' value chains is key to ensuring that this shift can materialise.

The requirements of the European Green Deal for safety, sustainability and circularity should be considered across the life cycle of a chemical or material. The 2022 Commission Recommendation on 'Safe and Sustainable by Design' (SSbD) sets out a new framework on how to achieve these objectives.

R&I activities should contribute to strengthen EU's critical raw materials capacities along all stages of the value chain, increasing our resilience by reducing dependencies, increasing preparedness and promoting supply chain sustainability and circularity, in line with the Critical Raw Materials Act. It is necessary to improve the energy and process efficiency of extractive and processing activities and minimise their environmental impact, including GHG emissions. Advancements need to be made on finding options for replacing critical raw materials with other (advanced) materials offering at least the same functionality and taking into account the existing environmental concerns.

Advanced materials (including amongst others nano- and 2D materials) and chemicals are designed with functionality in mind. Compared to conventional materials, they have novel properties that significantly step-up performance. New digital tools are needed such as common data spaces, digital twins, industrial virtual worlds, as well as novel (autonomous) design, synthesis, development, characterisation and fabrication tools as well as continuous training of scientists on these new tools.

To secure unimpeded market entry, appropriate test methods are needed. New chemicals and materials should be developed using the SSbD framework and with the efficiency and circularity of materials in mind, also for their inclusion in products. This calls for tools, models and data for robust SSbD, including animal-free new approach methodologies and systematic life-cycle assessments. Bio-based advanced materials/chemicals and the integration and interaction of biological and artificial materials and components offer new opportunities to reduce resource dependencies and maintain sustainability.

Achieving the circularity of both raw materials and advanced materials is a key future challenge. Establishing new material flows, recovery, recycling and upcycling of materials

from waste are challenges in themselves, but they also require information sharing along and across value chains and development of new business models allowing to foster innovative solutions related to technological progress, such as in materials design.

Uptake of advanced materials as well as a more efficient use of materials should be fostered in product and materials-based technology developments. This also requires new business models to be developed for the deployment of circular technologies and value chains as well as for providing product-as-a-service models, on-demand manufacturing, take-back-schemes and other service-based businesses. Strong support to SMEs is required so they can thrive in this materials ecosystem.

Business cases and exploitation strategies for industrialisation:

This section applies only to those topics in this Destination, for which proposals should demonstrate the expected outcomes by including a *business case and exploitation strategy for industrialisation*.

A business case and a credible initial exploitation strategy are essential components in the ultimate success of an industry-based project, as well as its prospects to attract further investments for deployment. They will both be decisive factors under the impact criterion, and proposers are encouraged to use the extended page limit to present a carefully considered business case and exploitation strategy, backed by the management of the companies involved.

The *business case* should demonstrate the expected impact of the proposal in terms of enhanced market opportunities for the participants and deployment in the EU, in the short to medium term. It should describe the targeted market(s); estimated market size in the EU and globally; user and customer needs; and demonstrate that the solutions will match the market and user needs in a cost-effective manner; and describe the expected market position and competitive advantage.

The *exploitation strategy* should identify obstacles, requirements and necessary actions involved in reaching higher TRLs (Technology Readiness Levels), for example: securing the required investments, including through possible synergies with other programmes; accessing the required skills; matching value chains; enhancing product robustness; securing industrial integrators; and user acceptance.

For TRLs 6 and 7, a credible strategy to achieve future full-scale deployment in the EU is expected, indicating the intentions of the industrial partners after the end of the project.

Where relevant, in the context of **skills**, it is recommended to develop training material to endow workers with the right skillset in order to support the uptake and deployment of new innovative products, services, and processes developed in the different projects. This material should be tested and be scalable, and can potentially be up-scaled through the European Social Fund Plus (ESF+). This will help the European labour force to close the skill gaps in the relevant sectors and occupational groups and improve employment and social levels across the EU and associated countries.

For topics in this destination, consortia (if selected for funding) could consider **voluntary contributions in terms of data, indicators and knowledge to relevant Joint Research Centre (JRC) platforms** for capitalising the knowledge developed in their projects and become more policy relevant:

- INnovation Centre for Industrial Transformation and Emissions (INCITE) (<https://innovation-centre-for-industrial-transformation.ec.europa.eu/>).
- The Energy and Industry Geography Lab: EIGL (<https://energy-industry-geolab.jrc.ec.europa.eu/>).

Innovation Actions — Legal entities established in China are not eligible to participate in Innovation Actions in any capacity. Please refer to the Annex B of the General Annexes of this Work Programme for further details.

Raw Materials

Proposals are invited against the following topic(s):

HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-61: Technologies for critical raw materials and strategic raw materials from end-of-life products (IA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 24.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>To increase EU resilience in raw materials supply chains and thus reduce the serious risk to the Union's strategic assets, economic and societal interests, autonomy and security associated with the current EU reliance on a few third countries for critical raw materials, by increasing sustainable and responsible sourcing of primary and secondary raw materials necessary to enable the green and digital transition and in</p>

	<p>alignment with the objectives of the Critical Raw Materials Act⁴⁷, participation in this topic is limited to legal entities established in Member States, associated countries, OECD countries, African Union Member States, MERCOSUR, CARIFORUM, Andean Community and countries with which the EU has concluded strategic partnerships on raw materials⁴⁸ as well as trade agreements (or association/economic partnership or equivalent agreements, including the new Clean Trade and Investment Partnerships) containing raw materials cooperation provisions (i.e. Energy and Raw materials chapters)⁴⁹. The choice of these countries was made taking into consideration the development of strategic international partnerships on raw materials and avoidance of reinforcing existing over-dependencies, as well as the importance of involving partners committed to pursuing open trade in such materials.</p> <p>Proposals including legal entities which are not established in the countries that fall under the criteria above will be ineligible.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: The projects' outcomes will enable the expected impacts of the destination by increasing supply security and access to secondary raw materials, in particular critical and strategic raw materials for EU⁵⁰ industrial value chains and strategic sectors which will alleviate critical raw materials dependency.

⁴⁷ Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L, 2024/1252, 3.5.2024, ELI: http://data.europa.eu/eli/reg/2024/1252/oj](https://eur-lex.europa.eu/eli/reg/2024/1252/oj)).

⁴⁸ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en

⁴⁹ https://policy.trade.ec.europa.eu/eu-trade-relationships-country-and-region/negotiations-and-agreements_en

⁵⁰ Annex I and II, Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and

Projects are expected to contribute to the following outcomes:

- Increased recovery rate of critical and strategic raw materials as set out in the Critical Raw Materials Act⁵¹ through developing raw materials recycling and re-use of components and/or products from end-of-life (EoL) products, including recovery of raw material by-products.
- Improved competitiveness of secondary raw materials production by enhancing cost effectiveness.
- Improved efficiency of technologies for separation and recycling and the sustainable embedment of the process in terms of energy, resource and water use, waste and emissions (including Green House Gases and air pollutants) footprint.
- Improved responsible supply of raw materials to Europe from EoL streams in line with the EU principles for sustainable raw materials,⁵² which are a non-regulatory set of principles based on the EU acquis. They set out requirements for sustainable raw materials and extraction and processing in Europe in terms of social, environmental and economic performance.
- Actions are expected to contribute to the implementation of the EU Critical Raw Materials Act⁵³.

Scope:

- Actions should develop material efficient high-quality re-use and recycling of one or more of the following end-of-life product categories/key waste streams: waste electrical and electronic equipment (WEEE), waste batteries, end-of-life vehicles, waste wind turbines, waste solar photovoltaics, waste heat pumps, waste electrolyzers and machine tools made from high-performance alloys.
- Actions should focus on the whole chain of re-using and recycling processes and procedures – from collection, logistics, characterisation, sorting, cleaning, refining and purification of secondary raw materials and quality of produced outputs.
- Actions should focus on functional re-use and recycling. Recycling where the recycled material is of lower functionality than the original material (downcycling) is to be avoided.

amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L, 2024/1252, 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>](#)).

⁵¹ Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L, 2024/1252, 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>](#)).

⁵² European Commission. Directorate General for Internal Market, Industry, Entrepreneurship and SMEs. (2021). EU principles for sustainable raw materials. Publications Office. <https://doi.org/10.2873/12856>

⁵³ To be updated after publication in the Official Journal

- Actions should envisage clustering activities with other projects aiming at recycling, second life, re-use, repurposing, remanufacturing of products and/or components relevant selected projects for cross-projects co-operation, consultations and joint activities on cross-cutting issues and share of results as well as participating in joint meetings and communication events. To this end proposals should foresee a dedicated work package and/or task, and earmark the appropriate resources accordingly.
- Actions should facilitate the market uptake of solutions developed through industrially- and user-driven multidisciplinary consortia covering the relevant value chain and should consider standardisation aspects when relevant. The action should also include the analysis of financial opportunities ensuring the market exploitation and replication of the circular business model behind the developed solutions as new processes, products and/or services.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination.

In this topic the integration of the gender dimension (sex and/or gender analysis) in research and innovation content is not a mandatory requirement, however, should you consider it to be of relevance for your specific proposal, you are strongly encouraged to do it.

HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-62: Strategic Partnerships for Raw Materials: Innovative Approaches for sustainable production of Critical Raw Materials (IA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 7.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>To increase EU resilience in raw materials supply chains and thus reduce the serious risk to the Union's strategic assets, economic and societal interests, autonomy and security associated with the current EU reliance on a few third countries for critical raw materials, by increasing sustainable and responsible sourcing of primary and secondary raw materials</p>

	<p>necessary to enable the green and digital transition and in alignment with the objectives of the Critical Raw Materials Act⁵⁴, participation in this topic is limited to legal entities established in Member States, associated countries, OECD countries, African Union Member States, MERCOSUR, CARIFORUM, Andean Community and countries with which the EU has concluded strategic partnerships on raw materials⁵⁵ as well as trade agreements (or association/economic partnership or equivalent agreements, including the new Clean Trade and Investment Partnerships) containing raw materials cooperation provisions (i.e. Energy and Raw materials chapters)⁵⁶. The choice of these countries was made taking into consideration the development of strategic international partnerships on raw materials and avoidance of reinforcing existing over-dependencies, as well as the importance of involving partners committed to pursuing open trade in such materials.</p> <p>Proposals including legal entities which are not established in the countries that fall under the criteria above will be ineligible.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>Due to the scope of this topic, legal entities established in countries with which the EU has established strategic partnerships for raw materials⁵⁷ are exceptionally eligible for Union funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Procedure</i>	The procedure is described in General Annex F. The following

⁵⁴ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L 2024/1252](https://eur-lex.europa.eu/eli/reg/2024/1252/oj), 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>).

	<p>exceptions apply:</p> <p>To ensure a balanced portfolio covering the four different groups mentioned in the scope below, grants will be awarded to applications not only in order of ranking but also to at least the highest ranked proposal within each group, provided that the applications attain all thresholds.</p>
<i>Exceptional page limits to proposals/applications</i>	<p>In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.</p>

Expected Outcome: Projects outcomes will enable the expected impacts of the destination by increasing supply security and access to more sustainable produced primary raw materials and secondary raw materials, in particular critical and strategic raw materials for EU⁵⁸ industrial value chains and strategic sectors.

Projects are expected to contribute to the following outcomes:

- Strengthen EU cooperation with countries the EU established strategic partnerships on Raw Materials⁵⁹;
- Improved industrial viability, safety and environmental impacts of the operation in a way that leads to measurable improvements;
- Improved diversification of EU sourcing of critical raw materials from third countries;
- Improved responsible supply of raw materials to Europe in line with the EU principles for sustainable raw materials⁶⁰, which are a non-regulatory set of principles based on the EU acquis. They set out requirements for sustainable raw materials and extraction and processing in Europe in terms of social, environmental and economic performance.
- Dissemination and exploitation of projects outputs is tailored for organisations and industry dealing with raw materials in the EU and project partner from Strategic partnership countries.
- Promote the utilisation of UNFC (United Nations Framework Classification for Resources) and UNRMS (United Nations Resource Management System) in the raw materials sector.

⁵⁸ Annex 1 and Annex 2, Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 (OJ L, 2024/1252, 3.5.2024, [http](http://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en)).

⁵⁹ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en

⁶⁰ European Commission. Directorate General for Internal Market, Industry, Entrepreneurship and SMEs. (2021). EU principles for sustainable raw materials. Publications Office. <https://doi.org/10.2873/12856>

- Actions are expected to contribute to the implementation of the EU Critical Raw Materials Act⁶¹.

Scope: Proposals should:

- Develop and demonstrate extraction, processing or refining technologies in order to facilitate and increase recovery in exploitation of primary critical raw materials (minerals and metals only). The proposals have to demonstrate (measure and assess) reduced environmental and social impact. Proposals can include additional exploration aspects if duly justified.
- Justify the relevance of all targeted minerals and metals. Priority are the EU critical raw materials. Sea mining is not within the scope of this topic.
- Collaborate with countries with which the EU has signed Strategic Partnerships on Raw Materials.⁶²
- Collaborate with one selected Strategic Partnership country out of the four groups: Group 1 (Argentina, Chile), Group 2 (Democratic Republic of the Congo, Namibia, Rwanda, Zambia), Group 3 (Kazakhstan, Serbia, Uzbekistan), Group 4 (Australia, Greenland). Group 4 can be extended to countries which will sign strategic partnerships for raw materials before the deadline for applications. The consortia should include raw materials industry from the targeted country in the focussed group, as well as downstream users from the EU. Proposals are expected to focus on one out of four groups.
- Demonstrate technology on mineral resources of the targeted partner country. The environmental (including GHG and other air pollutant emissions, water, soils, biodiversity) and social impacts of technology should be duly measured and assessed.
- Envisage clustering activities with other relevant selected projects for cross-projects co-operation, consultations and joint activities on cross-cutting issues and share of results as well as participating in joint meetings and communication events. To this end proposals should foresee a dedicated work package and/or task, and earmark the appropriate resources accordingly.
- Facilitate the market uptake of solutions developed through industry- and user-driven multidisciplinary consortia covering the relevant value chain and should consider standardisation aspects if relevant. The action should also include the analysis of financial opportunities ensuring the market exploitation and replication of the circular

⁶¹ Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 (OJ L, 2024/1252, 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>).

Expected Outcome: Projects outcomes will enable achieving the expected impacts of the destination by increasing access to primary raw materials and secondary raw materials, in particular critical raw materials for EU⁶⁶ industrial value chains and strategic sectors.

Projects are expected to contribute to the following outcomes:

- Decreased dependency of the EU on imported raw materials for semiconductor production and decreased risk in European semiconductor supply chains. The actions targeting strategic raw materials⁶⁷ should contribute to the benchmarks as set out in the

⁶⁵ https://policy.trade.ec.europa.eu/eu-trade-relationships-country-and-region/negotiations-and-agreements_en

⁶⁶ Annex 2, Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L, 2024/1252, 3.5.2024, ELI:https://data.europa.eu/eli/reg/2024/1252/oj](#)).

⁶⁷ Annex 1, Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L, 2024/1252, 3.5.2024, ELI:https://data.europa.eu/eli/reg/2024/1252/oj](#)).

Critical Raw Materials Act⁶⁸.

- Raw materials for semiconductors competitively produced and refined in the EU in a sustainable and socially acceptable way improving the competitiveness of European industry.
- Increase recovery rates of particularly raw materials from low grade or complex ores and/or from residues and/or by-products and/or extractive waste and/or manufacturing waste.
- Increase the competitiveness and sustainability of mineral processing and refining processes in terms of cost-effectiveness, higher material-, water-, energy-efficiency, emission reduction and flexibility. This may also include the development of more sustainable solvents, reagents, and low-carbon manufacturing processes.
- Foster collaboration among industry stakeholders along the value chain, research institutions, and technology providers to accelerate the development and adoption of sustainable production solutions.
- Improve responsible supply of raw materials to Europe in line with the EU principles for sustainable raw materials⁶⁹, which are a non-regulatory set of principles based on the EU acquis. They set out requirements for sustainable raw materials and extraction and processing in Europe in terms of social, environmental, and economic performance.

Scope: Actions should focus on raw materials for semiconductors necessary for the green and digital transition and strategic sectors, such as for example aero-space; including one or more of the following raw materials: antimony, arsenic, bismuth, boron, gallium, germanium, indium, selenium, silicon, tellurium.

Actions should facilitate the market uptake of solutions developed through industrially- and user-driven multidisciplinary consortia covering the relevant value chain from extraction to the production of semiconductor grade raw materials and alloys, as well as relevant downstream industry. Standardisation aspects should be considered when relevant.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination. For TRLs 6-7, a credible strategy to achieve future full-scale deployment in the EU and encourage long-term industrial collaboration is expected, indicating the intentions of the industrial partners after the end of the project.

Actions should envisage clustering activities with other relevant selected projects for cross projects co-operation, consultations and joint activities on cross-cutting issues and share of

⁶⁸ Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L, 2024/1252, 3.5.2024, ELI:https://eur-lex.europa.eu/eli/reg/2024/1252/oj](https://eur-lex.europa.eu/eli/reg/2024/1252/oj)).

⁶⁹ European Commission. Directorate General for Internal Market, Industry, Entrepreneurship and SMEs. (2021). EU principles for sustainable raw materials. Publications Office. <https://doi.org/10.2873/12856>

results as well as participating in joint meetings and communication events. To this end proposals should foresee a dedicated work package and/or task, and earmark the appropriate resources accordingly.

Actions should also contribute to improving the awareness of relevant external stakeholders and the general public across the EU about the importance of raw materials for society, the challenges related to their supply within the EU and about proposed solutions which could help to improve society's acceptance of and trust in sustainable raw materials production in the EU.

In this topic the integration of the gender dimension (sex and/or gender analysis) in research and innovation content is not a mandatory requirement, however, should you consider it to be of relevance for your specific proposal, you are strongly encouraged to do it.

HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-64: EU Co-funded Partnership on raw materials for the green and digital transition (Co-funded partnership Raw Materials for the Green and Digital Transition)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 90.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 90.00 million.
<i>Type of Action</i>	Programme Co-fund Action
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>To increase EU resilience in raw materials supply chains and thus reduce the serious risk to the Union's strategic assets, economic and societal interests, autonomy and security associated with the current EU reliance on a few third countries for critical raw materials, by increasing sustainable and responsible sourcing of primary and secondary raw materials necessary to enable the green and digital transition and in alignment with the objectives of the Critical Raw Materials Act⁷⁰, participation in this topic is limited to legal entities established in Member States, associated countries, OECD countries, African Union</p>

⁷⁰ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L 2024/1252](https://eur-lex.europa.eu/eli/reg/2024/1252/oj), 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>).

	<p>Member States, MERCOSUR, CARIFORUM, Andean Community and countries with which the EU has concluded strategic partnerships on raw materials ⁷¹ as well as trade agreements (or association/economic partnership or equivalent agreements, including the new Clean Trade and Investment Partnerships) containing raw materials cooperation provisions (i.e. Energy and Raw materials chapters)⁷². The choice of these countries was made taking into consideration the development of strategic international partnerships on raw materials and avoidance of reinforcing existing over-dependencies, as well as the importance of involving partners committed to pursuing open trade in such materials.</p> <p>Proposals including legal entities which are not established in the countries that fall under the criteria above will be ineligible.</p> <p>The coordinator role of the action is limited to public institutions being R&I programme owners or funders.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>Due to the scope of this topic, legal entities established in countries with which the EU has established strategic partnerships for raw materials⁷³, as well as in countries which were participating in ERAMIN ³⁷⁴, are exceptionally eligible for Union funding.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. The EUR 60 000 threshold provided for in Article 208(a) of the Financial Regulation No 2024/2509 does not apply, as financial support provided by the participants to third parties is one of the primary activities of this action in order to be able to achieve its objectives. The maximum amount of FSTP to be granted to an individual third party is EUR 8 million.</p>

⁷¹ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en

⁷² https://policy.trade.ec.europa.eu/eu-trade-relationships-country-and-region/negotiations-and-agreements_en

⁷³ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L 2024/1252](https://eur-lex.europa.eu/eli/reg/2024/1252/oj), 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>).

⁷⁴ <https://www.era-min.eu/about-era-min-3>

	The funding rate is 30% of the eligible costs.
<i>Total indicative budget</i>	The total indicative budget for the topic is EUR 90 million committed in annual instalments in the years 2025 and 2027 (EUR 45 million from the 2025 budget and EUR 45 million from the 2027 budget).

Expected Outcome: Projects outcomes will enable achieving the expected impacts of the destination by increasing supply security and access to primary and secondary raw materials, in particular critical and strategic raw materials⁷⁵ for EU industrial value chains and strategic sectors.

Projects are expected to contribute to the following outcomes:

- Align national R&I priorities in raw materials with EU policy on raw materials.
- Strengthen EU cooperation with countries the EU established strategic partnerships on Raw Materials⁷⁶;
- Improve industrial viability, safety and environmental impacts of the operation in a way that leads to measurable improvements;
- Improve EU sourcing diversification of critical raw materials from third countries;
- Improve responsible supply of raw materials to Europe in line with the EU principles for sustainable raw materials⁷⁷, which are a non-regulatory set of principles based on the EU acquis. They set out requirements for sustainable raw materials and extraction and processing in Europe in terms of social, environmental and economic performance.
- Dissemination and exploitation of projects outputs is tailored for organisations and industry dealing with raw materials in the EU and project partner from Strategic partnership countries.
- Promote the utilisation of UNFC (United Nations Framework Classification for Resources) and UNRMS (United Nations Resource Management System) in the raw materials sector.
- Actions are expected to contribute to the implementation of the EU Critical Raw Materials Act⁷⁸, particularly to the 2030 benchmarks.

⁷⁵ Annex 1 and Annex 2, Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 ([OJ L, 2024/1252, 3.5.2024, ELI:https://eur-lex.europa.eu/eli/reg/2024/1252/oj](https://eur-lex.europa.eu/eli/reg/2024/1252/oj)).

⁷⁶ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en

⁷⁷ COM(2023) 165 - A secure and sustainable supply of critical raw materials in support of the twin transition

⁷⁸ Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and

Scope:

- The objective of the European Partnership on Raw Materials is to strengthen the co-ordination of national and regional research programmes in the field of non-energy and non-agricultural raw materials, ensuring common understanding of R&I challenges to achieve the objectives of the Critical Raw Materials Act⁷⁹.
- The Partnership will build on the experience of ERA-NETs: ERA-MIN, ERA-MIN 2 and ERA-MIN 3. The Partnership should cover the whole raw materials value chain including exploration, extraction, processing technologies, and recycling and improve circularity. Sea mining is excluded from this topic.
- Proposals should pool the necessary financial resources from the participating national (or regional) research programmes with a view to implementing joint annual calls for proposals resulting in grants to third parties with EU co-funding in this area. Financial support provided by the participants to third parties is one of the primary activities of this action in order to be able to achieve its objectives.
- As specified in the eligibility conditions, the Partnership is open to all EU Member States, associated countries to Horizon Europe, OECD countries, African Union Member States⁸⁰, MERCOSUR, CARIFORUM, Andean Community and countries with which the EU has concluded strategic partnerships on raw materials⁸¹ as well as trade (or association/economic partnership or equivalent) agreements containing raw materials cooperation provisions (i.e. Energy and Raw materials chapters)⁸². Participation remains open to those wanting to join during the Partnership's lifetime.
- Beneficiaries should preferably be national, regional or local institutions responsible for programming research and innovation activities in raw materials. To ensure alignment of R&I activities and raw materials policy participation is also additionally open to relevant Ministries and public institutions responsible for raw materials and R&I policy.
- This Partnership should be implemented through a joint programme of activities ranging from research to coordination and networking activities, including training, demonstration, piloting and dissemination activities, to be structured along the following main building blocks:
 - o Joint annual calls for R&I activities;

amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 (OJ L, 2024/1252, 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>).

⁷⁹ Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 (OJ L, 2024/1252, 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>).

⁸⁰ *African Union member states* includes countries whose membership has been temporarily suspended
⁸¹ https://single-market-economy.ec.europa.eu/sectors/raw-materials/areas-specific-interest/raw-materials-diplomacy_en

⁸² https://policy.trade.ec.europa.eu/eu-trade-relationships-country-and-region/negotiations-and-agreements_en

- o Facilitating further uptake and commercialisation of developed R&I results;
 - o Clustering of projects and synthesising of R&I results;
 - o Coordinating research programmes between EU and its Member States and participating third countries and trigger combined action;
 - o Serving as a centre for knowledge on partner countries' R&I programmes and activities in raw materials.
- Actions should also provide measures contributing to the objectives of the Critical Raw Materials Act⁸³ and of EU raw materials policy.
 - Partners are expected to provide financial and/or in-kind contribution, in line with the level of ambition of the proposed measures. The partnership should be open to including new partners over the lifetime of the partnership. Its governance should create a clear and transparent process for engaging with a broad range of stakeholders, together with the full members of the partnership, to ensure that the work strategically covers a wide range of views in the field of biodiversity, nature-based solutions and ecosystem services throughout the lifetime of the partnership. To ensure that all work streams are coherent and complementary, and to leverage knowledge investment potential, the partnership is expected to foster close cooperation and synergies with the projects funded under Cluster 4 Digital, Industry and Space. It should also develop synergies with other relevant European initiatives, funding programmes and platforms such as EIT Raw Materials.
 - Financial support provided by the participants to third parties is one of the primary channels under this action to enable the partnership to achieve its objectives. The maximum amount to be granted to each third party is EUR 2 million. It is expected that the partnership organises joint calls on an annual base from 2026 to 2032 and therefore it should factor ample time to run the co-funded projects.
 - The total indicative budget for the partnership is EUR 300 million. The EU contribution will be limited to 30% of the total eligible costs of the action with a maximum of EUR 90 million.

The starting date of grants awarded under this topic may be as of the submission date of the application. Applicants should justify the need for a retroactive starting date in their application. Costs incurred from the starting date of the action may be considered eligible.

Innovative Advanced Materials

Proposals are invited against the following topic(s):

⁸³ Regulation (EU) 2024/1252 of the European Parliament and of the Council of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials and amending Regulations (EU) No 168/2013, (EU) 2018/858, (EU) 2018/1724 and (EU) 2019/1020 (OJ L, 2024/1252, 3.5.2024, ELI: <http://data.europa.eu/eli/reg/2024/1252/oj>).

HORIZON-CL4-2025-05-MATERIALS-42-two-stage: Innovative Advanced Materials (IAMs) for product monitoring, smart maintenance and repair strategies in the construction sector (RIA) (Innovative Advanced Materials for Europe partnership)

Call: INDUSTRY two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants submitting a proposal under the blind evaluation pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 5-6 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-</p>

	2025) ⁸⁴ .
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Projects are expected to contribute to the following outcomes:

- Support the implementation of the Commission Communication on Advanced Materials for Industrial Leadership⁸⁵.
- Break frontiers between functional and structural materials by applying monitoring applications enabling infrastructure management such as tracking, self-powering and self-sensing to reduce maintenance costs by at least 30% compared to the state-of-the-art.
- Reduce the resources (materials and energy) needed for constructions and lower environmental impacts by applying innovative advanced materials (IAMs) with improved performance of structural or functional components, combining longevity and efficiency, repairability and circularity (improving overall materials circularity by at least 30%);
- Proof of concept of the ‘safe and sustainable by design’ (SSbD) framework during the development phase of the new IAMs to avoid use of hazardous substances and lower environmental impact;
- Promote industrial uptake of IAMs by facilitating scalability and/or integration into leaner industrial production processes;
- Support acceptance of innovative construction materials for housing to achieve maximized user experience and comfort.

Scope: Extend the lifetime of materials used in the construction sector (e.g. cement, concrete, composites, technical textiles, plaster board, pipes) for which durability is often limited by poor stability and low flexibility and/or by increasingly aggressive and changing environments. Extending a products’ life (use phase) is an important pillar of a solid sustainable and circular strategy because it reduces materials demands. In addition, new materials fit for the circular economy should be easily dismantlable into reusable or recyclable components. The actual condition and functional performance of products, components and materials should be monitored and assessed and smart maintenance and repair functions implemented, ideally at the level of individual products or components. Autonomous repair

⁸⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁸⁵ COM(2024) 98 final

systems often use sensors to detect changes in the material's condition through physical principles or mechanical deformation. The smart (AI) exploitation of collected data enables real-time monitoring of the material's condition. The surfaces created in the building process are ideal for smart solutions incorporating ubiquitous electronic systems.

Proposals should develop new and/or improved IAMs that increase recyclability, circularity and safety of construction materials reducing (raw) materials consumption by:

- Increased durability and reliability and reduced maintenance requirements (e.g. self-cleaning and/or self-healing properties, self-protection, increased stress resistance and innovative protection treatments such as corrosion and/or erosion resistance, increased fatigue resistance);
- Support smart material functionalities for continuous monitoring and in-service inspections, e.g. through integrated sensors, with multifunctional features (such as asset management tracking, self-powering and/or self-sensing for several parameters).

Multidisciplinary research activities should address at least two of the following:

- Develop strategies to accelerate the time-consuming performance evaluation step to greatly reduce the times to prototyping and then to market.
- Enhance sensor capabilities for tailored solutions through IAMs with extended physical sensor functionalities for mechanical-technological traits;
- Develop self-repairing and -healing materials for complex and resource-intensive structures, receptive to digital stimuli to retroactively influence material properties and integrating autonomous repair mechanisms to enhance their reliability (such as in composites, ceramics, coatings, technical textiles etc), extend their lifespan and enabling easy recycling;
- Develop (AI based) models like digital twins to utilize high-dimensional new sensor data and generate multimodal stimuli and functionalities for customised maintenance and repair plans, extending product lifetime economically and environmentally;
- Produce and share new knowledge on underlying multi-scale and multi-physics phenomena to better understand materials behaviour during their lifetime, develop and validate methodologies and suitable models to predict materials degradation (mechanical and/or environmental) and to assess the longevity of materials, components and products through accelerated testing and functional performance verification;
- Develop IAMs fit for modular off-site processing or 3D printing onsite;

In addition, all proposals should

- Use new digital technologies including data driven approaches to push the frontiers of designing and producing IAMs with new functionalities/performance, improve materials

scalability and related processes and use analytical technologies and infrastructures to characterise the efficiency, quality and effectiveness of developed IAMs;

- Contribute to the availability of FAIR⁸⁶ data and methods for safety and sustainability assessment of IAMs and for decision-making processes (at the design, engineering and end-of-life stage of IAMs and products);
- Explore possibilities to transfer and use developed IAMs or technologies in other sectors;
- Assess safety, sustainability and circularity of all components during the entire innovation cycle as well as how to decompose and sort for enhanced recyclability of all components at the end of life, in line with the safe and sustainable by design (SSbD) framework.

Proposals need to address both the IAM development and all the supporting technologies (digital and physical) needed (not existing yet) to cover the entire value chain (material development, validation, production, processing, use and end of life). Any existing technologies that do not require development or adaptation should be mentioned in the proposal.

Proposals should involve appropriate expertise in Social Sciences and Humanities (SSH), particularly regarding the acceptance of innovative construction materials for housing for maximized user experience and comfort. This may involve a perception analysis of these materials, resulting functionalities and the development of optimization strategies.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination.

Research should build on existing standards or contribute to standardisation of technologies encompassing sensing, self-repairing or self-healing materials. Interoperability for data sharing should be addressed, in accordance with the FAIR data principles. Projects should build on, or seek collaboration with, existing projects in EU Member States and Associated Countries and develop synergies with other relevant European, national or regional initiatives, funding programmes and platforms. Where relevant, projects are encouraged to take advantage of and connecting to European analytical research infrastructures and services.

Proposals could consider the involvement of the European Commission's Joint Research Centre (JRC), whose contribution could consist of providing added value on new solutions for advanced materials in construction, including the ability to dismount and reuse, multifunctionality, smart maintenance and enhanced circularity and safety.

International cooperation is encouraged, especially with Japan.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

⁸⁶ Findable, Accessible, Interoperable, Reusable data

This topic implements the co-programmed European Partnership Innovative Advanced Materials for the EU (IAM4EU). Proposals funded under this topic are part of the partnership portfolio and are expected to develop synergies with the related stakeholder community and contribute actively to the objectives of the partnership. The different stakeholder communities in IAM4EU are encouraged to coordinate amongst and across each other and foresee adequate resources for this as well as for the overall coordination with IAM4EU in the proposals.

HORIZON-CL4-2025-05-MATERIALS-43-two-stage: Innovative Advanced Materials (IAMs) for robust, fast curing sealants and coatings for manufacturing and final assembly (IA) (Innovative Advanced Materials for Europe partnership)

Call: INDUSTRY two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants submitting a proposal under the blind evaluation pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3-4 and achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-</p>

	2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ⁸⁷ .
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Projects are expected to contribute to the following outcomes:

- Support the implementation of the Commission Communication on Advanced Materials for Industrial Leadership⁸⁸.
- Prolong lifespan and performance of components and products across sectors using IAMs-based coatings, functionalised surfaces and/or sealings to withstand specific or challenging requirements and/or harsh environments;
- Lower maintenance needs and overall reduced Cost of Ownership for essential, structural or functional components and products;
- Lower environmental impact through improved resource efficiency, reduced energy consumption, increased recyclability at end of life and/or substitution of hazardous substances.
- Proof of concept of the ‘safe and sustainable by design’ (SSbD) framework during the development phase of the new IAMs;
- Promote industrial uptake of IAMs by facilitating scalability and/or integration into leaner industrial production processes;

Scope: One of the main factors limiting the lifespan of products (and their components) is their prolonged exposure to environmental elements. The combination of different stressors and changing conditions (operational, daily, seasonal) results in accelerated aging and premature or unanticipated failures. To prevent the resulting adverse effects, protective coatings and sealings are key to provide additional protection without requiring the reassessment of the physical design of the product/component, nor the inherent properties of the parts to be coated/sealed.

Moreover, performance evaluation of coated samples to select coating solutions which meet the demands of industrial end users constitute another bottleneck in the fast development of IAM-based coatings. In addition, recyclability is often hampered by the sealants and coatings

⁸⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

⁸⁸ COM(2024) 98 final

used. The new IAMs-based coatings, functionalised surfaces and sealings should allow to decompose products and structures into recyclable or reusable parts.

Proposals should develop new and/or improved IAMs-based coatings, functionalised surfaces and/or sealings that improve recyclability, circularity and safety of developed materials and products, reduce (raw) materials consumption, costs of production, manufacturing and disassembly by:

- Combining multiple functionalities, e.g. fast curing and drying, self-curing, mechanical and durable robustness, protection from environmental agents (sun, rain, snow, humidity, corrosion, erosion, temperature, ...), or a combination of beneficial thermal, acoustic, magnetic, electrical and tribological properties;
- Satisfy multiple requirements across different application areas such as electronics; (renewable) energy production and storage; automotive; maritime; aviation and rail infrastructures; construction, including HVAC⁸⁹ components;

Multidisciplinary research activities should address at least two of the following:

- Develop strategies to accelerate the time-consuming performance evaluation step to greatly reduce the times to prototyping and then to market.
- Develop functionalised surfaces (directly functionalised or via coatings), which can substantially improve the integrity, efficiency and overall performance of products and can cope with sometimes extreme surface areas (small/large) and complex and/or high aspect ratio geometries requiring advanced processing and tooling;
- Design and develop new sealants and coatings that can be applied by automated processes (higher speed and precision by digitalization), cured at room temperature (no extra heating or air conditioning of large paint shops or hangars required) and with curing times reduced by at least 90% compared to the state-of-the-art (in terms of increased productivity and/or decreased energy consumption);
- Master batch synthesis of IAMs with cutting-edge properties that allow production and processing of robust, fast and/or self-curing sealants and coatings to be applied in the manufacturing and final assembly lines in industries, and transferable between sectors;
- Produce and share new knowledge on underlying multi-scale and multi-physics phenomena to better understand materials behaviour during their lifetime, develop and validate methodologies and suitable models to predict material degradation and assess release rates from coatings and sealants used in harsh environments;

In addition, all proposals should

- Use new digital technologies including data driven approaches to push the frontiers of designing and producing IAMs with new functionalities/performance, improve materials

⁸⁹ Heating, Ventilation and Air Conditioning

scalability and related processes and use analytical technologies and infrastructures to characterise the efficiency, quality and effectiveness of developed sealants, coatings or surfaces;

- Contribute to the availability of FAIR⁹⁰ data and methods for safety and sustainability assessment of IAMs and for decision-making processes (at the design, engineering and end-of-life stage of IAMs and products);
- Explore possibilities to transfer and use developed IAMs or technologies in other sectors;
- Assess safety, sustainability and circularity of all components during the entire innovation cycle as well as how to decompose and sort for enhanced recyclability of all components at the end of life, in line with the safe and sustainable by design (SSbD) framework.

Proposals need to address both the IAM development and all the supporting technologies (digital and physical) needed (not existing yet) to cover the entire value chain (material development, validation, production, processing, use and end of life). Any existing technologies that do not require development or adaptation should be mentioned in the proposal.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination.

Research should build on existing standards or contribute to standardisation of technologies for IAM-based sealings and coatings. Interoperability for data sharing should be addressed, in accordance with the FAIR⁹¹ data principles. Projects should build on, or seek collaboration with, existing projects in EU Member States and Associated Countries and develop synergies with other relevant European, national or regional initiatives, funding programmes and platforms. Where relevant, projects are encouraged to take advantage of and connecting to European research infrastructures and services in the area of analytical research infrastructures.

International cooperation is encouraged, especially with Japan.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

This topic implements the co-programmed European Partnership Innovative Advanced Materials for EU (IAM4EU). Proposals funded under this topic are part of the partnership portfolio and are expected to develop synergies with the related stakeholder community and contribute actively to the objectives of the partnership. The different stakeholder communities in IAM4EU are encouraged to coordinate amongst and across each other and foresee adequate resources for this as well as for the overall coordination with IAM4EU in the proposals.

⁹⁰ Findable, Accessible, Interoperable, Reusable data

⁹¹ Findable, Accessible, Interoperable, Reusable data

**HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-44: Innovative Advanced
Materials Innovation Procurement (CSA)**

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).⁹².</p>

Expected Outcome:

- Leverage innovation procurement processes to stimulate innovation in advanced materials addressing specific needs or challenges faced by public procurers.
- Drive market transformation by aligning public procurement strategies with broader policy objectives, such as the twin transition.
- Establish market dialogue between the public demand side and the supply side, industry, and research organisations, reducing the gap between innovation procurement strategies and innovative solution development roadmaps on both sides.
- Develop proposals for amending Commission guidelines and sharing best practice on innovation procurement targeting resource and energy efficiency gains due to innovative technologies related to advanced materials.
- Identify standardisation needs for procurers in line with the Commission communication on Advanced Materials for Industry Leadership.

⁹² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: The use of advanced materials⁹³ has the potential to reinforce the Union's resilience and competitiveness as well as achieving circularity, materials efficiency and overall sustainability targets. Public procurers can play a leading role in driving innovation and fostering the uptake of advanced materials, thereby speeding up the market introduction of technologies that enable the twin transition and EU's resilience and economic security. Advanced materials drive innovations in new clean energy technologies provided for in the Net-Zero Industry Act and have the potential to substitute certain Critical Raw Materials (CRMs), thus contributing to the objectives of the CRM Act. Advanced materials can also replace hazardous substances, improve the environmental performance of products and processes, and facilitate circularity.

Public Procurements that make better use of advanced materials can potentially achieve a substantial impact towards these policy objectives in all areas where the public sector is an important customer such as construction, mobility, electronics and energy. Examples of functionalities that could potentially be realised through advanced materials include thermal isolation and protective coatings in construction, superior reliability and durability of energy and mobility infrastructures, improved performance of electronic devices, increased circularity and cost-efficient maintenance of products.

Mandatory requirements in public procurement procedures, relating to for example energy efficiency performance or environmental sustainability, are foreseen in the Energy Efficiency Directive⁹⁴, the Net Zero Industry Act⁹⁵ and the Ecodesign for Sustainable Products Regulation⁹⁶. More generally, the EU Public Procurement Directives allow contracts to be awarded not only based on lowest price, but also on other criteria linked to the subject matter of the contract, such as improved performance/functionalities provided by advanced materials. Furthermore, the Competitiveness Compass for the EU⁹⁷ foresees the introduction of a European preference in public procurement for strategic sectors and technologies, reinforcing technological security and domestic supply chains, as well as simplifying and modernising rules, in particular for start-ups and innovative companies.

The objective of this coordination and support action (CSA) is to create a Europe-wide consortium of public procurers that define together unmet procurement needs for innovative solutions based on advanced materials.

The consortium should prepare future procurement topics to conduct Pre-Commercial Procurements (PCP)/Public Procurements of Innovative Solutions (PPI) that make use of advanced materials with novel functionalities for sectors where public procurers and key customers, in particular aligned with objectives pertinent to advanced materials.

Proposal objectives should reflect making best use in public procurements of innovative material properties that contribute to superior product performance (including the impact on

⁹³ [Advanced Materials for Industrial Leadership, COM\(2024\)98 final](#)

⁹⁴ [Energy Efficiency Directive](#)

⁹⁵ Regulation 2024/1735

⁹⁶ Regulation 2024/1781

⁹⁷ COM(2025)30 final

e.g. production, maintenance or recyclability) and/or contribute to policy objectives such as those formulated in the Green Deal, the Net-Zero Industry Act, the Critical Raw Materials Act and the Ecodesign for Sustainable Products Regulation while having the potential to be exploited as widely as possible.

Activities supported by this CSA should include the following aspects:

- open market consultation with the industry;
- market analysis and analysis of potential barriers (status of market developments regarding advanced materials versus the procurement needs, standardisation, certification, regulatory requirements, intellectual property rights, contracting models, payment schemes, etc.);
- consultations with other public buyers and relevant stakeholders such as end-users to prepare for a future market uptake of the solutions and effective use of innovation procurement (PCP/PPI).

HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-45: Materials Commons for Europe (IA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 28.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 28.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3-4 and achieve TRL 5-6 by the end of the project – see General Annex B.
<i>Exceptional page limits to proposals/applications</i>	In order to accommodate the complexity of the activities required under this topic, the page limit in part B of the General Annexes is exceptionally extended to a total of 60 pages.

Expected Outcome: The project is expected to contribute to the following outcomes:

1. Create a pioneer federated digital infrastructure for advanced materials research and development, demonstrating use cases facilitating industrial uptake and offering a feedback loop to academic research;

2. Give researchers from industry and academia access to interoperable, heterogeneous and FAIR⁹⁸ data sources and computational tools that support the workflows for the design and development of advanced materials;
3. Address the requirements of experimental workflows for high-quality, well-structured and documented primary data by providing tailored solutions to experimentalists;
4. Provide a framework to support self-driving labs using the digital infrastructure, enabling to use of state-of-the-art AI technologies and predictive modelling techniques in industry and academia;
5. Devise mechanisms for long term sustainability and expansion to future use cases.

Scope: This action will accelerate R&I in the area of advanced materials by bringing together at EU level experience, knowledge and resources, from existing and new national digital infrastructures for advanced materials design and development.

It will set the ground for the implementation of a long term sustainable European digital infrastructure for advanced materials R&I as announced in the Communication on Advanced Materials for Industrial Leadership⁹⁹, supporting academic and industrial collaborations.

Such a digital infrastructure should:

- Interconnect existing and new infrastructures devoted to advanced materials design and development across the EU supported by AI tool and facilitate access to High-Performance Computing facilities.
- Help researchers and innovators from across Europe to significantly accelerate the design, development, characterisation and testing of new or improved advanced materials in a controlled environment.
- Foster trust in data sharing among stakeholders (including researchers, research organisations, industry and SMEs) based on FAIR data principles, while also fostering common materials taxonomies, ontologies and data interoperability.
- Be based on an inclusive approach that fosters contributions from academia and industry, across different sectors, using a user-centric view that takes into account intellectual property rights and ownership.
- Support virtual design of advanced materials and related processing. Foster the progress towards self-driving labs which are widely accessible to European researchers.

To achieve these goals, beneficiaries are in principle expected to be publicly funded organisations with the necessary expertise, which are mandated by their competent ministry. They must be able to function as major (e.g., national or regional) hubs and contact points for stakeholders in national ecosystems, exploring models for participation and contribution,

⁹⁸ Findable, Accessible, Interoperable and Reusable

⁹⁹ COM(2024) 98 final

while also working closely with pan-European organisations working on the digitalisation of R&I on advanced materials.

The inclusive nature of the Materials Commons for Europe shall be facilitated through the creation of an advisory board as part of the project composed of relevant ministries or national funding bodies supporting short- and long-term solutions. The applicants are encouraged to consider a project duration of around four years.

The envisioned project should follow the following phases:

1. Phase 1: Planning and Framework Establishment

- Developing functional and non-functional requirements and identifying existing solutions (e.g., cloud solutions, middleware, data spaces) that can be used to accelerate, or be integrated into, the infrastructure. Identification of possible use of existing infrastructures and resources, including support for and integration of self-driving labs.
- Planning a governance framework, able to implement the infrastructure meeting the functional and non-functional requirements, including a strategy for adhesion of new entities in the long term.
- Agreeing on long-term sustainability plan, taking into account academic, industry needs and aspects going beyond R&I.
- Determining compatibility issues and standardisation needs, also in relation to semantic interoperability.
- Setting out key stakeholders, including from academia and industry and related projects and initiatives which will be the users of the infrastructure.

1. Phase 2: Initial build-up

- Building up trust infrastructure and enabling remote access.
- Governance framework for data, computational tools and workflows at operational level.
- Standards and machine readable, domain-specific data schemas and Advanced Programming Interfaces, enabling semantic interoperability and interconnections between different datasets and tools.
- Support for European self-driving labs and their interconnection to the infrastructure, enabling them to reach higher levels of data-driven decision making and automated workflows.

1. Phase 3: Demonstration

- Integration of workflows and tools, including those aimed at creation of primary data.

- 5 use cases across different sectors and related demonstrators, facilitating industrial uptake and offering a feedback loop to academic research.
- concrete steps towards sustainability.

Complementarity and synergies should be sought with existing national initiatives such as Material Digital¹⁰⁰, DIADEM¹⁰¹ and CaPeX¹⁰², as well as with innovation-related strategies, policies, programmes and plans at national and/or regional level. This also extends to EU initiatives such as the proposed “Innovative Materials for EU” partnership, Data Spaces including in particular the European Open Science Cloud (EOSC)¹⁰³, EuroHPC¹⁰⁴ and Open Innovation Testbeds¹⁰⁵.

The action should also envisage the coordination with a possible mutual learning exercise (MLE) on this topic, targeted to countries leading on this area and those who still need to improve national digital infrastructure, enabling an exchange of experience with digital infrastructures, and creating synergies with ongoing related initiatives.

Proposals should involve appropriate expertise in Social Sciences and Humanities (SSH), in particular to achieve a user-centred design that facilitates access across different sectors, and by different communities with different characteristics.

HORIZON-CL4-2025-03-MATERIALS-46: Innovative Advanced Materials (IAMs) for photonics, enabling low-power and ultra-broadband performance for telecommunication (RIA) (Innovative Advanced Materials for Europe partnership)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication

¹⁰⁰ <https://www.materialdigital.de/>

¹⁰¹ <https://pepr-diadem.fr>

¹⁰² <https://capex.dtu.dk/>

¹⁰³ <https://eosc.eu/>

¹⁰⁴ https://eurohpc-ju.europa.eu/index_en

¹⁰⁵ <https://op.europa.eu/en/publication-detail/-/publication/0aaf1e05-2082-11ee-94cb-01aa75ed71a1/language-en>

	networks.
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 6 by the end of the project – see General Annex B

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- Demonstrated added value of Innovative Advanced materials (IAMs) such as Two-dimensional materials and EO polymers for integrated photonic devices and systems, with focus on low power consumption, enabling future telecommunication networks in which Europe can build competitive value chains.
- IAMs for miniaturized and outperforming photonic integrated technologies e.g. in terms of performance, power, cost, novel functionality enabling the development of future-proof, scalable, low-power and high-bandwidth devices.

Scope: IAMs can be the ideal candidate for several applications in photonics and optoelectronics. These include ultrafast integrated photonic circuits, with modulators, waveguides, detectors, emitters and switches, which play a crucial role in the ongoing quest to increase the speed of data transmission in telecommunications networks. In addition, they find utility in high-frequency transmitter modulators and receiver demodulators, which are essential for advancing wireless telecommunications technologies. They can also serve as integral components in optical interconnects for data centers, high-performance computing (HPCs), and artificial intelligence/machine learning (AI/ML) computing systems.

The main objective of this topic is to explore innovative solutions based on IAMs, including 2DMs, that offer state-of-the-art performance and low power consumption, while demonstrating scalability for volume production, thus exploiting the semiconductor manufacturing infrastructure. The envisioned compact devices are expected to be designed to be compatible with low-power driving electronics and thus reduce energy consumption. Solutions should be compatible with existing photonic integrated platforms and low-voltage electronics.

Proposals are expected to integrate the value chain and include relevant manufacturing technologies required to bring the developed devices to market. Prototypes are expected to be developed using packaged devices, including electronics, to enable testing in relevant environments.

Efforts should be focused on envisioning optimized routes for electronic and photonic design, fabricating photonic circuits, producing IAMs, conducting testing, executing wafer-scale fabrication, and performing co-integration and co-packaging, ultimately leading to demonstrations of the developed technologies and their added values.

Where relevant, proposers are encouraged to take advantage of and connecting to European analytical research infrastructures and services such as the ones in the ARIE network ¹⁰⁶.

Proposals should also consider building their innovations on top of relevant existing standards and consider standardisation as part of innovation and dissemination activities.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

This topic implements the co-programmed European Partnership Innovative Advanced Materials for Europe (IAM4EU). Proposals funded under this topic are part of the IAM4EU partnership portfolio and are expected to develop synergies with the related stakeholder community and contribute actively to the objectives of the partnership. Proposals should seek collaboration, with existing projects and develop synergies with other relevant European, national, or regional initiatives, funding programmes such as the Graphene Flagship ¹⁰⁷ for proposals investigating 2D materials. In addition, outreach to relevant national projects in EU Member States and Associated Countries is encouraged. Adequate resources for all these synergies should be foreseen in the proposal.

HORIZON-CL4-2025-03-MATERIALS-47: Innovative Advanced Materials (IAMs) for conformable, flexible or stretchable electronics (RIA) (Innovative Advanced Materials for Europe partnership)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 15.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 6 by the end of the project – see General Annex B

¹⁰⁶ <https://arie-eu.org/>

¹⁰⁷ Graphene Flagship: <https://graphene-flagship.eu/>

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- Conformable, flexible or stretchable electronic devices and circuits, enabling improved user experience and adoption;
- Sustainable electronics based on low environmental impact materials, promoting reparability and/or recyclability and compatible with energy and resource efficient manufacturing processes;
- Materials tailored for solution-processed electronics such as semiconductor, conductive, dielectric, electroactive polymers, low environmental impact and/or functional substrates, etc. enabling high performance and reliable flexible electronics devices.

Scope: The concept of "ubiquitous electronics" can be a unique opportunity for the EU, opening up new avenues for e.g., wearable electronics, e-textile, e-skin, wellbeing solutions and Internet of wearable things (IoWT), which represent strategic markets for the EU. Innovative and advanced materials (IAMs) can enable new technologies and the much-needed paradigm of an electronic device that can adapt to any substrate. Despite the progress made in this field, current devices are made up of a limited proportion of flexible, conformable, and stretchable components, mainly sensors, while the rest of the circuit remains rigid, limiting this technology shift.

The overall objective is to discover Innovative Advanced Materials (IAMs), including 2DMs, with improved properties in terms of flexibility, conformability and stretchability that can enable novel flexible electronic applications, with a focus on environmentally friendly technologies with reduced carbon footprint processing. Proposals should address most of the following challenges:

- Discomfort of existing wearables leading to non-adoption
- Environmental impact of current electronics due to the use of hazardous and/or critical raw materials, energy-hungry and resources intensive processes
- Low or limited performance and durability of existing materials for high performance and reliable flexible electronic devices and circuits
- Limited integrability of current electronics: size and/or weight, complex cabling, interface between flexible and rigid components, design limitations (i.e., pattern geometry, thickness, dimensions).

Proposals should address reparability and/or recyclability of devices and circuits e.g. reversible adhesives and interconnects, low temperature soldering, bio-based or recycled substrates such as low thermal budget paper and inks, bio-resorbable conductive materials for the next generation of transient implanted medical devices, etc., compatibility with energy and resource efficient manufacturing processes e.g., printing, thermoforming, high pressure forming, lamination, injection moulding, etc.

Where relevant, proposers are encouraged to take advantage of and connecting to European analytical research infrastructures and services such as the ones in the ARIE network ¹⁰⁸.

Proposals should also consider building their innovations on top of relevant existing standards and consider standardisation as part of innovation and dissemination activities.

This topic implements the co-programmed European Partnership Innovative Advanced Materials for Europe (IAM4EU). Proposals funded under this topic are part of the IAM4EU partnership portfolio and are expected to develop synergies with the related stakeholder community and contribute actively to the objectives of the partnership. Proposals should seek collaboration, with existing projects and develop synergies with other relevant European, national, or regional initiatives, funding programmes such as the Graphene Flagship ¹⁰⁹ for proposals investigating 2D materials. In addition, outreach to relevant national projects in EU Member States and Associated Countries is encouraged. Adequate resources for all these synergies should be foreseen in the proposal.

Safe and Sustainable by Design

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-05-MATERIALS-51-two-stage: Development of safe and sustainable by design alternatives to Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS) (IA)

Call: INDUSTRY two-stage	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 7.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>Applicants submitting a proposal under the blind evaluation pilot (see General Annex F) must not disclose their organisation names, acronyms, logos nor names of personnel in the proposal abstract and Part B of their first-stage application (see General Annex E).</p>

¹⁰⁸ <https://arie-eu.org/>

¹⁰⁹ Graphene Flagship: <https://graphene-flagship.eu/>

<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3-4 and achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>This topic is part of the blind evaluation pilot under which first stage proposals will be evaluated blindly.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ¹¹⁰.</p>
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome: Projects are expected to contribute to the following outcomes:

- Make safer and more sustainable alternatives to per- and poly-fluoroalkyl substances (PFAS) available to industries offering products with targeted performances supporting their competitiveness;
- Give the Commission, regulatory agencies, Member States and associated countries access to new and publicly available knowledge about PFAS alternatives;
- Support EU strategies, policies and legislation, such as future PFAS restrictions under the REACH Regulation ¹¹¹, as well as requirements for the EU Ecolabel ¹¹², EU Taxonomy ¹¹³ and Eco-design for Sustainable Products Regulation (ESPR) ¹¹⁴, by making safe and sustainable alternatives to PFAS available;

¹¹⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

¹¹¹ Regulation (EC) No 1907/2006 of the European Parliament and of the Council of 18 December 2006 concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH), <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:02006R1907-20231201>

¹¹² <https://ec.europa.eu/environment/ecolabel/the-ecolabel-scheme.html>

¹¹³ https://commission.europa.eu/energy-climate-change-environment/standards-tools-and-labels/products-labelling-rules-and-requirements/sustainable-products/ecodesign-sustainable-products-regulation_en

- Demonstrate the applicability of the ‘Safe and Sustainable by Design’ (SSbD) framework¹¹⁵ to avoid regrettable substitution when developing innovative safe alternatives to PFAS.

Scope: PFAS are a large class of substances used in a wide range of applications (for instance, as adhesives, coatings, lubricants, sealants, surfactants), for their technical and/or safety functions (e.g., water and oil repellence, antiadhesion, thermal & chemical stability)¹¹⁶. Nevertheless, PFAS have been detected in groundwater, surface water and soil, the remediation of which is extremely problematic^{117,118}. Their accumulation in the environment has been linked to negative effects for the wildlife and the human health, including carcinogenic, mutagenic, reprotoxic and toxic effects for the endocrine system¹¹⁹. In January 2023, five national authorities submitted to the European Chemicals Agency (ECHA) a PFAS restriction dossier to ban the manufacture, placing on the market and use of PFAS as a chemical class in all uses, with few exemptions¹²⁰.

The Commission initiative for SSbD sets a framework which should be a reference in the proposal. The new alternatives to be developed should meet the technical functions required in the specific applications and align with such framework.

Proposals should address at least one industrial application and should develop one or more new chemical substances or technologies to replace existing PFAS used, according to abovementioned applications and functions, in one of the following areas:

- **Electronics, electrical appliances and grids** (e.g., wires, cables, heat transfer fluids, transformers, switchgears), where PFAS are currently used to provide a combination of technical and/or safety functions to withstand impact of high temperature, pressure and chemicals, ensure corrosion inhibition and non-flammability.
- **Construction technologies** (e.g., carpeting, drywall, paintings, foams) where PFAS are currently used to provide a combination of technical functions such as resistance in harsh environments and for wetting agents.
- **Technical textiles** (e.g., personal protective equipment, construction textiles, filtration and separation media, technical textiles for transport applications) where PFAS are currently used for their repellence but also heat stability and corrosion inhibition.

¹¹⁵ See documents defining the SSbD framework and criteria on: https://ec.europa.eu/info/research-and-innovation/research-area/industrial-research-and-innovation/key-enabling-technologies/advanced-materials-and-chemicals_en

¹¹⁶ This list of applications and functions are not exhaustive, unless explicitly mentioned.

¹¹⁷ <https://www.eea.europa.eu/en/european-zero-pollution-dashboards/indicators/pfas-contamination-and-soil-remediation-signal>

¹¹⁸ [PFAS in European seas \(Signal\) \(europa.eu\)](https://www.euractiv.com/en/chemicals/pfas-in-european-seas-signal/europa.eu/)

¹¹⁹ <https://doi.org/10.2903/j.efsa.2022.e200418>

¹²⁰ [Per- and polyfluoroalkyl substances \(PFAS\) - ECHA \(europa.eu\)](https://echa.europa.eu/per-and-polyfluoroalkyl-substances-pfas)

- **Automotive parts** (*e.g.* electrical parts including batteries, membranes, hoses and pipes, brakes, rubber processing) where PFAS are also currently used¹²¹.

All actors along the value chain should be involved to ensure the new substance has a clear use case, market and potential to grow.

Multidisciplinary research activities should address all of the following:

- The ‘Safe and Sustainable by Design’ framework should be applied when developing the alternative(s) and the assessment results be published and underlying methods and data made FAIR across the whole value chain;
- The selection of the PFAS alternatives to be developed should be justified with a technological and socio-economic analysis, also considering potential impacts on health and reproductive health;
- Novel PFAS-free materials or structures should undergo testing under relevant conditions to ensure their properties meet or exceed the properties of PFAS-based solutions across various applications;
- The substitution barriers for the selected applications should be identified and a driving mechanism for a maximal substitution in the targeted value chains proposed;
- Challenges for the adaption of existing production lines should be identified and solutions proposed;
- Communication and other outreach actions to all stakeholders and specifically citizens about the benefits of the developed ‘Safe and Sustainable by Design’ alternatives to PFAS substances.
- Proposals should involve appropriate expertise in Social Sciences and Humanities (SSH), *e.g.* with communities of citizens to engage in product reliability and consumer rights. At least, an analysis of how the introduction of such alternatives is positively or negatively considered by users and the general population, disruptive (or not) for the established social norms or behavioural patterns, should be conducted;
- Policy briefs will be reported to the European Commission on a yearly basis to communicate on the key results and achievements.

Proposals should indicate to which chapters of the Strategic Research and Innovation Plan for chemicals and materials¹²² they will contribute.

Proposals submitted under this topic should include a business case and exploitation strategy.

¹²¹ The use of (gaseous) PFAS in air conditioning is outside the scope of this call.

¹²² https://ec.europa.eu/info/research-and-innovation/research-area/industrial-research-and-innovation/key-enabling-technologies/advanced-materials-and-chemicals_en

In accordance with the SSbD framework, this topic requires the effective demonstration of the added value of the outcomes to protect human health and the environment, *e.g.* in the fields of biodiversity protection, indoor and /or outdoor air quality.

Collaboration with existing Open Innovation Test Beds (OITBs)¹²³ should be explored - where relevant.

International collaboration is encouraged.

The challenge of developing PFAS alternatives should also cooperate with relevant topics under other clusters and calls of Horizon Europe (*e.g.* HORIZON-CL4-2021-RESILIENCE-01-08¹²⁴, HORIZON-CL4-2022-RESILIENCE-01-23¹²⁵, HORIZON-CL6-2023-ZEROPOLLUTION-02-2-two-stage¹²⁶, Horizon 2020 LC-GD-8-1-2020¹²⁷), including topics under the Chips Joint Undertaking and the Clean Hydrogen Joint Undertaking (*e.g.* HORIZON-JTI-CLEANH2-2024-05-02: Development of non-fluorinated components for fuel cells and electrolyzers). Proposals should specifically allocate the necessary resources for collaboration with the other relevant projects.

HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-52: Accelerate the uptake of life-cycle assessment (LCA) for Safe and Sustainable by Design (SSbD) chemicals and materials and resulting products (RIA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 15.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3-4 and achieve TRL 5-6 by the end of the project – see General Annex B.
<i>Legal and financial</i>	The rules are described in General Annex G. The following exceptions

¹²³ https://ec.europa.eu/info/research-and-innovation/research-area/industrial-research-and-innovation/sustainable-production-processes_en

¹²⁴ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/opportunities/topic-details/horizon-cl4-2021-resilience-01-08>

¹²⁵ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/opportunities/topic-details/horizon-cl4-2022-resilience-01-23>

¹²⁶ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/opportunities/topic-details/horizon-cl6-2023-zeropollution-02-2-two-stage>

¹²⁷ <https://ec.europa.eu/info/funding-tenders/opportunities/portal/screen/opportunities/topic-details/lc-gd-8-1-2020>

<i>set-up of the Grant Agreements</i>	apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹²⁸ .
---------------------------------------	---

Expected Outcome: Projects are expected to contribute to the following outcomes:

- Support the implementation of EU strategies such as the proposed Eco-design for Sustainable Products Regulation (ESPR)¹²⁹, the EU Ecolabel¹³⁰, the Green Claims Directive proposal¹³¹, the One-Substance-One-Assessment package¹³², the Batteries Regulation¹³³, the Critical Raw Materials Act¹³⁴ and the Net Zero Industry Act¹³⁵ with scientific evidence on sustainability throughout the entire life cycle of chemicals and materials,;
- Reduce significantly the cost to apply LCA at company level, including for SMEs, compared to current costs;
- Allow an efficient and simplified LCA application at early stage of design and facilitate decision making for companies and policy makers by providing user-friendly and cost-effective tools, methods and data;
- Provide advanced, reliable and predictive life cycle models and impact assessment methods, allowing for a satisfactory measurement of planetary boundaries;

Scope: Proposals should identify and fill the gaps in LCA tools, methods and data used for improving the environmental sustainability and efficiency of chemicals, materials and resulting products, taking also into account the criticality of raw materials. The Environmental Footprint (EF) methods should in particular be built on. All stages from raw material extraction to end-of-life disposal of products should be included. Data-driven decisions and actions for a greener and more sustainable future should be enabled, while respecting

¹²⁸ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/lc-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/lc-decision_he_en.pdf

¹²⁹ [Proposal for Ecodesign for Sustainable Products Regulation](#)

¹³⁰ [EU Ecolabel](#)

¹³¹ [Green Claims Directive proposal](#)

¹³² [‘One substance, one assessment’ chemicals assessment reform](#)

¹³³ [Batteries Regulation](#)

¹³⁵ [Net-Zero Industry Act](#)

planetary boundaries. The tools should be in compliance with the Safe and Sustainable by Design¹³⁶ framework, hence to be considered as a reference in the proposal.

Multidisciplinary research activities should address all the following:

- Develop advanced, user-friendly LCA tools and methodologies that allow for a comprehensive assessment of the environmental sustainability of the entire lifecycle of chemicals, materials and resulting products whilst considering planetary boundaries;
- Develop LCA datasets, in particular building on the EC PEF methods, from design to end-of-life of at least three relevant chemicals or materials and a selection of their resulting products. The selected substances should be emerging alternatives to substances of concern (as defined in the ESPR proposal) and should have a high socio-economic value;
- Develop solutions to fill in the identified data and assessment gaps and to estimate LCA uncertainty, using advanced digital technologies, modelling, machine learning and artificial intelligence;
- Feed relevant sustainability databases managed by the European Institutions and Agencies, such as the European Platform on LCA¹³⁷ (EPLCA), with FAIR¹³⁸ data and ensure new tools developed are findable by stakeholders.
- Provide guidance for LCA modelling of circularity scenarios for chemicals, materials and resulting products, in alignment with EC PEF methods and the SSbD framework;
- Ensure that the developed tools, methods and datasets are cost-effective and user-friendly in order to increase uptake and use in industry;
- Develop guidelines and user-friendly solutions to enable a seamless integration of the new LCA approaches with existing safety assessment tools and methods (notably the EC PEF method) to ensure a holistic SSbD assessment from the early innovation phases;
- Engage with the wider stakeholder community, especially with SMEs, to promote a harmonised use of the proposed tools and methodologies;
- Perform training and knowledge transfer activities to promote LCA and SSbD knowledge as well as life cycle thinking within the R&I ecosystem;
- Projects should contribute to yearly policy briefs and technical discussions, for example under the Eco-design for Sustainable Products Regulation (ESPR)¹³⁹ or with the EF Technical Advisory Board;

¹³⁶ See documents defining the SSbD framework on: https://ec.europa.eu/info/research-and-innovation/research-area/industrial-research-and-innovation/key-enabling-technologies/advanced-materials-and-chemicals_en

¹³⁷ [European Platform on LCA | EPLCA](#)

¹³⁸ Findable, Accessible, Interoperable, Reusable

- Proposals should leverage the experience of Social Sciences and Humanities (SSH) researchers in refining models related to child labour, employment conditions, and other socio-economic factors within LCA;
- The improved/advanced tools and methods should consider evaluating the economic and social dimension of sustainability at product level based on a functional unit.

Proposals should indicate to which chapters of the Strategic Research and Innovation Plan for chemicals and materials¹⁴⁰ they will contribute.

International collaboration is encouraged.

Projects should build on, or seek collaboration with, existing projects and develop synergies with other relevant European, national or regional initiatives, funding programmes and platforms. Specifically, projects should collaborate with the Partnership on Assessment of Risks from Chemicals¹⁴¹ (PARC) and ensure complementarity with the SSbD toolbox¹⁴² and also engage with the IRISS project¹⁴³ on the different value chains. Additionally, projects are encouraged to build on the results obtained by the ORIENTING¹⁴⁴ project funded under the CE-NMBP-42-2020¹⁴⁵ topic which has aimed to operationalise methodologies for LCA and to propose options to further advance the Product Environmental Footprint (PEF). Proposals should allocate the necessary resources for the above activities. Where relevant, proposers are encouraged to take advantage of and connecting to European research infrastructures and services.

Synergies with Horizon Europe missions as relevant are encouraged.

Textiles

Proposals are invited against the following topic(s):

HORIZON-CL4-INDUSTRY-2025-01-MATERIALS-31: Digitally enabled local-for-local textile and apparel production (Textiles for the Future Partnership) (IA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission

	and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6-7 by the end of the project – see General Annex B.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. The maximum amount to be granted to each third party is EUR 60 000.</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁴⁶</p>
<i>Exceptional page limits to proposals/applications</i>	In order to include a business case and exploitation strategy, as outlined in the introduction to this Destination, the page limit in part B of the General Annexes is exceptionally extended by 3 pages.

Expected Outcome:

- Demonstrate economic viability of local on-demand production of fashion and other complex textile products, including for professional or public end markets, through integration of advanced digital technologies across the full product life cycle from creation, production, distribution, use and end-of-life;
- Accelerate adoption of advanced digital product creation and manufacturing technologies by European textile and fashion SMEs; and
- Increase share of re- or near-shored production of time-critical textile products, made in socially and environmentally responsible ways, including recycled materials; and in this way contribute to the mitigation of GHG emissions.

¹⁴⁶ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: Up to 80% of textile and apparel products consumed in Europe are partially or fully made outside Europe, exploiting lower labour cost as well as laxer local standards and regulations with regards to environmental, human health and labour rights protection. This offshoring of production has slowed textile manufacturing technology innovation in Europe and led to a complex long-lead time supply chain, generating unnecessary production and pre-consumer waste from unused mass-produced materials and unsold products not meeting actual demand.

Digitalisation in product development, production and on-demand supply chains has the potential to significantly reduce such overproduction, and enable business models that can competitively offer rapid short run or single piece production as well as related repair or end-of-life dismantling services for effective local recycling.

These aspects are particularly important in view of the new requirements to be set under the Ecodesign for Sustainable Products Regulation under which textiles are flagged as one of the priority product groups for the elaboration of a sustainable policy framework that could consider durability, recyclability, repairability and recycled content the most important product aspects

Proposals should address at least one of the two following activities:

1. Small scale demonstration, experimentation or piloting of approaches, processes or technologies for:

- Complex manufacturing operations including yarn or fabric production and final product assembly that go beyond state-of-the-art processes such as digital garment printing;
- Seamless interoperable data flows and transparency towards the end user that pursue and harness waste minimisation, short time to market and trust-building between supply chain partners and end users;
- Valorisation of locally available renewable raw materials (biobased or recycled) and regional production capacities that allow for shortest time to market and lowest environmental footprint;
- Micro-factories that can flexibly combine small-scale local production, repair, and re-and de-manufacturing operations.

2. Uptake of innovative service-driven business models that maximise consumer value creation and lowers total cost of ownership from high-quality long-lasting products.

Proposals submitted under this topic should include a business case and exploitation strategy, as outlined in the introduction to this Destination.

Proposals should include financial support to third party (FSTP) to maximise the number of SMEs involved in small-scale innovation projects. All such innovation projects should include at least one advanced technology provider; one manufacturing SME; and one end-market facing company, such as a retailer or a professional or consumer service provider. The

partners should be from at least two different countries. FSTP funding can be provided only to SME participants, while the active participation of larger companies in such innovation projects is encouraged. The involvement of start-ups is also specifically encouraged. To ensure a focused effort, each third-party beneficiary should receive funding up to EUR 60 000, in projects with an indicative duration of 18 months.

International cooperation may be considered, in particular with countries that are advanced in the field.

Where relevant, projects should build on or seek collaboration with existing projects and develop synergies with other relevant European, national or regional initiatives and funding programmes.

This topic implements the co-programmed European Partnership ‘Textiles for the Future’.

Destination 3: Developing an agile and secure single market and infrastructure for data-services and trustworthy artificial intelligence services

The next stage of the data economy will shift data flows from the consumer-to-business model to business-to-business, business-to-consumer, consumer-to-consumer, business-to-government and government-to-business models.

Destination 3 will continue to support technologies that are crucial for the next stages of the data economy, such as privacy preserving technologies and compliance technologies, source and transaction integrity (such as blockchain), and technologies underpinning interoperable and compliant industrial, public and personal data spaces and secure data exchanges. Rebalancing the data, computing, and learning capacity across the cloud-to-edge/internet of things continuum will let businesses, public organisations and individuals exploit data for trustworthy and bias-free decision making.

Wide availability of reliable data, like from the European data spaces in the Digital Europe Programme, together with new interactive, immersive and context-aware technologies – digital twins, cyber-physical systems, internet of things and virtual worlds – will make this easier than ever before. This will help all people groups benefit from the power of data and AI in a fair, unbiased and compliant way.

Industrial virtual worlds that are open and interconnected bring alternative but realistic and coherent views on what are widely distributed, diverse and complex devices, processes and value chains. Beyond visualisation and simulation, and thanks to new types of interfaces (like XR/VR), secure data sharing and distributed computing technologies, they allow for safe and natural ways of interaction and control, high level of response to local events, real-time optimisation and dynamic re-configuration in key application areas like for: i) the integration of renewable energy sources, ii) smart farming, iii) agile supply chains and logistics, and iv) hyperflexible manufacturing and manufacturing-as-a-service. Similarly, data-driven tools, AI, language technology, adaptive and self-programmed robotics, and new energy-aware programming solutions will improve operational and energy efficiency in lead sectors like healthcare, manufacturing, mobility, and the energy sector itself.

Quantum technologies will further expand the data economy in high value-added areas where traditional approaches struggle to deliver, for instance, highly secure communication of critical data, or on exponentially complex simulations, machine learning and optimisation. Quantum networks will provide highly secure, tamper-free data storage and transmission, which can be critical in situations where the integrity and confidentiality of the data are paramount, like in the health sector, smart cities, energy systems or other critical infrastructure.

The strategic development of communication networks (5G, 6G) as well as the future structures of data intermediation and governance, high-capacity computing and artificial intelligence through the cloud and the edge are very important to the single market, Europe's economic security and sustainable competitiveness. They are also vital for trustworthy data- and AI-based services.

Connected Collaborative Computing Networks (3C networks)

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-03-DATA-08: Large-scale pilots for supply end-to-end infrastructures integrating device, network computing and communication capabilities for Telco Edge Cloud deployments, as a basis for Connected Collaborative Computing Networks (3C networks) (RIA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 75.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 75.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the</p>

	meaning of ‘restrictions for the protection of European communication networks’ (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees. ¹⁴⁷
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 7 by the end of the project – see General Annex B.

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- Strengthen European industrial ecosystems for the 3C Network, while enabling the path towards sustainability and competitiveness of key vertical sectors in the EU, to be supported in the work programme 2026-2027 of Horizon Europe by future large-scale pilot focusing on 3Cs demand in vertical industrial sectors such as “industrial virtual worlds” (automotive, aerospace, processing, manufacturing, agriculture, electronics), services (mobility, energy, smart communities, health) or others.
- Strategic industrial cooperation among network and data processing stakeholders which enable new revenue streams in support of viable communication infrastructures by building open platforms, underpinning an emerging industrial open telco edge cloud ecosystem to be established in Europe.
- The pilot should devise appropriate cooperation mechanisms with the Open Internet Stack actions, to help defining the requirements for the development of the building blocks and ensure their integration in the pilot, including envisaging mechanisms for testing and integration of the solutions developed by the Open Internet Stack.
- A European vision of advanced digital infrastructures through the convergence of connectivity with interoperable edge and cloud computing services. Moreover, the large-scale pilot should seek and include sufficient evidence of a clear commitment from the major European telecom, cloud and edge providers to industrialise further the results of the pilot among the major stakeholders, in particular by considering the necessary business adaptations and future perspectives, etc. In this context, an advisory group of end users should be set up to discuss and advise about user requirements to be considered in relation to the pilots. This group will collect requirements from a large range of users and test them through small demonstrations.

¹⁴⁷

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

Scope: The recent Commission White Paper “How to master Europe’s digital infrastructure needs?” highlights the convergence of electronic communications networks and cloud services, and call for the strengthening of the EU “Telco Edge Cloud” infrastructure, by creating the 3C Network (Connected Collaborative Computing).

The convergence of connectivity, including mobile networks (5G and 5G advanced), combined with computing environments at the edge and cloud is a unique opportunity for the European telecom industry to drive a European vision of next generation digital infrastructures and meet future processing demands of IoT and AI. Investing into future computing and connectivity paradigms will strengthen the industrial European supply side and deliver an enablement for the path towards sustainability of key sectors in the demand side.

Increased density of edge and cloud facilities is needed to sustain adoption of innovative and sovereign telco edge cloud technologies across Europe. Backed by ubiquitous connectivity to deliver the right performance in terms of bandwidth and latency, Europe’s infrastructure will require advanced network management and orchestration technology as well as neutral interconnection services to guarantee efficient infrastructure utilisation and enable innovative use cases at scale.

The 3C Network large-scale pilot (focusing on the supply side) aims at setting up end-to-end integrated infrastructures and platforms, bringing together players from different segments of the connectivity and compute value chain and beyond. The main target is to research and validate the integration of device, network, cloud and edge computing, and communication capabilities for telco edge cloud deployments to realize a ubiquitous mesh of computing and communication resources. This will complement the Telco Edge Cloud reference deployments of Digital Europe and IPCEI-CIS and will feed into future deployment initiatives.

Therefore, the scope for the action would be the following:

- Researching and prototyping at scale end-to-end telco edge cloud integrated infrastructures and platforms, bringing together players from different segments of the connectivity value chain and beyond, such as operators, system integrators, network/cloud/edge suppliers, experts on AI and (wireless) communication, experts on testing and validation of network technologies and services, IoT platform providers et al.
- Developing open orchestration platforms across the telco edge cloud continuum, to support unlocking the transformative value of AI for European businesses and driving business growth in multiple industries strategic for Europe and associated countries.
- Integrating AI solutions for optimising the orchestration of the different resources to be managed by the pilot actions, such as bandwidth, spectrum, computing, hardware, other user requirements.

- Investigation, testing, validation and demonstration of solutions and prototypes of the simultaneous use of integrated devices, edge and cloud computing and communication resources in operational environments (including both public networks and large private networks), ensuring high level of security and privacy, energy efficiency, transparency and control of the ecological footprint.
- Investigation, testing, validation and demonstration of integration of available infrastructures as cloud-edge continuum with distributed systems such as blockchain infrastructure and services, data spaces and seamless and comprehensive AI systems in the process of creation of decentralised digital infrastructure network, including the compliance with applicable EU regulations.
- Exploration of novel approaches for cybersecurity by design and sustainability in advanced communication infrastructure.

With radical changes triggered by GenAI, as well as AI applications penetrating more and more industrial domains, demands for low latency are looming. The pilot should have to tackle the network evolution complementing the cloud with progress towards the edge, as well as needing reliability from the mobile networks.

Key aspects to be researched, validated and demonstrated by the 3C Network end-to-end infrastructures include:

- AI-enabled orchestration and quality assurance tools, algorithms and techniques which cater for hybrid multi-cloud technologies.
- Enablers for multi-level (networks, edge, cloud, and services) federation management and interoperability.
- Tools and mechanisms that facilitate the standardised exposure of network functions.
- Enablement of Edge-as-a-Service approaches that effectively integrate cloud computing's multi-tenancy and resource sharing concepts into access networks.
- Security and Compliance mechanisms targeted for telco edge cloud.
- Tools for guaranteed end-to-end QoS and QoE across heterogeneous network, cloud and edge infrastructures.
- Mechanisms to exploit specialised hardware and accelerators to address the strict requirements (e.g. latency, energy efficiency) of virtualised network functions.
- Investigation on the trade-offs associated to Edge nodes density and placement required in telco edge cloud deployments to achieve the target latency rates.
- Lightweight virtualisation and cloud-native approaches for virtualised network functions.

- Novel approaches to handle user mobility to ensure edge service continuity and quality of service.
- Privacy preserving record linkage on individual citizen level and device-related level to foster meaningful linkage of data for secondary usage.

Thanks to these, the pilot and its associated research should support the emergence of telco edge cloud as-a-service approaches that successfully implement multi-tenancy and resource sharing notions from cloud computing into network infrastructure and resources. In addition, the project infrastructures should cater for the pragmatic complexities associated with the physical placement of the various types of telco edge cloud platforms (near, far, regional,) across the territory considering the necessary trade-offs between performance, capacity, and costs.

Furthermore, the pilot should tackle the need for multi-cloud and edge service orchestration at scale, which enables workload portability across providers and technologies as well as effective service placement and lightweight and cloud-native forms for NFV and optimisation by means of acceleration, multi-cloud orchestration, multi-level federation and mobility management.

Moreover, the technical solutions in the pilot should investigate the use of AI to handle the optimal allocation and optimisation of the operation of the digital infrastructures resultant of the combination of distributed compute and network resources of the edge cloud compute continuum in a predictive and efficient manner and at scale. These should take into consideration the appropriate QoS trade-offs in relation to bandwidth, spectrum, computing, hardware and other functional and non-functional requirements, cater for the need for AI/ML to improve optimisation of assets and process and closed-loop automation, and target development and life-cycle management of AI models and resource management tools for the optimal management of combined and converged network, cloud and edge infrastructures. It will integrate security and privacy by design into account and seek to incorporate mechanisms such as edge discovery and deployment as-a-service delivery, end-to-end network and compute performance, energy efficiency and mobility management, including the Non-Terrestrial Network component for ubiquity.

The pilot should provide an *open, multi-supplier, multi-vendor, and interoperable Telco Edge Cloud reference architecture and ecosystem* that encourages cooperation and cooperative development among all key stakeholders, with broad representation of MS/AC, owing to the joint research to be implemented. Furthermore, the pilot should define open access policies and mechanisms that aim to maximise the impact of the provided infrastructure which take into consideration the long-term sustainability and addressing different uses by industrial and research communities. When necessary, these should explore collaboration with complementary actions addressing the demand side.

Project participants should analyse the existing standards landscape as a key state-of-the-art input when planning their project activities, and relevant open-source projects (e.g., Sylva, ANUJET, Nephio, CAMARA). The development paths of the critical technologies are

expected to be merged and aligned to support the standardisation and uptake of 6G and Web 4.0.

The pilot should help maturing the technologies resulting from medium TRLs projects, while performing its own research towards enabling and prototyping of converged telco cloud edge platforms in operational and multi-suppliers, multi-domain and multi-tenant environments.

The pilot should cover research on infrastructure and platforms mid-TRLs telco edge cloud technologies, including development of telco-cloud network resources orchestration, demos, proof of concepts and early deployment of technologies.

The main achievements of the pilot should be showcased by means of small-scale demonstrations, that could be scaled up in future work programmes, for instance demonstrators on virtual worlds for industrial settings.

The pilot should ensure a high degree of participation of stakeholders from the relevant technological sectors, including SMEs, scaleups and start-ups, as well as properly consider the demand side from vertical sectors and broad representation of MS/AC, also in view of the planned demand-side large-scale pilots. In this regard, proposals should clearly define the roles and responsibilities of the participating stakeholders in developing, testing, validating, updating, maintaining and/ or using the technologies and services of the 3Cs network. The pilot's Consortium should also define a policy on the ownership and access of 3Cs network resources and facilities, during the Horizon Europe project and beyond.

Proposals are expected to build synergies and ensure complementarities with relevant topics under SNS JU Work Programme 2022-2024, Digital Europe Programme WP2023-2024, IPCEI-CIS, Connecting Europe Facility.

The large-scale pilot would ideally reuse and extend relevant open-source frameworks and capitalise on existing testing and trial platforms from European or national initiatives¹⁴⁸ among which the IPCEI-CIS, SNS Stream C (dedicated to the development of EU-wide experimentation platforms incorporating promising 6G enablers), SNS Stream D projects (which focuses on implementing large-scale trials and targets specific verticals of high economic and societal importance), and other SNS projects, results from Open Internet Stack action, the Cloud-Edge-IoT HE projects, and the Digital Europe Programme's Reference edge-cloud deployments, the "Empowering AI across the continuum" and the "Software engineering for AI" R&I areas, as well as research results on infrastructure and platforms. It should also establish strong relationship and collaboration with complementary EU-funded research activities, and also ensure close interaction with the relevant constituencies driving that research, including the Open Internet Stack constituencies. Relevant research from both the supply and the demand side of 3C networks should be considered in this regard, thus ensuring participation of research organisations from all across the value chain.

Finally, digital autonomy in edge and cloud implies that computation infrastructure should be able to be sourced from European technology, including non-terrestrial network

¹⁴⁸ Such as UNICO 6G in Spain, CAMPUS-OS in Germany, 6G Flagship in Finland, etc.

infrastructure. The subsequent step following the EU investments in processors for HPC (under the EuroHPC Joint Undertaking) is to extend its success to the rest of the computing continuum. Therefore, the project will also seek to coordinate with other EU (HE) research activities with a view to integrating new processor architectures into cloud edge infrastructures as they become available.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

HORIZON-CL4-2025-03-DATA-09: Alignment of stakeholders towards the supply-side large-scale pilot of end-to-end infrastructures integrating device, network computing and communication capabilities (CSA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.80 and 2.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and associated countries.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, shall not participate in the action.</p>

Expected Outcome: The supply-side large-scale pilot (LSP) of end-to-end infrastructures integrating device, network computing and communication capabilities will develop

horizontal facilities for the benefit of constituencies represented in the supply LSP and also beyond, including those focusing on the demand side of the referred infrastructures. This CSA is expected to bring together all those stakeholders. In any case, the CSA action should be prepared, managed and coordinated by key stakeholders in the field, while it would be important that the coordinator adopts a neutral position.

Project results are expected to contribute to the following expected outcomes:

- Coordination of the different stakeholder communities in the scope of the supply LSP work (software, hardware, computing, telcos, AI, cloud...), bringing stakeholders together to work on a common plan and technology roadmap on supply and demand of end-to-end infrastructures integrating device, network computing and communication capabilities, monitoring implementation and identifying gaps.
- Enable the supply-side LSP to consider the demand-side perspective, including requirements from the different applications/user communities.
- Help stakeholders build small, and later larger-scale, demos based on the developments of the supply-side LSP, as well as developments from future Horizon research actions as possible and appropriate.
- Assist stakeholders from the different segments of the value chain (telecoms, software providers, middleware stack providers, etc.) to converge towards a shared approach, while modular and flexible, for telco-edge-cloud infrastructure and services
- Put in place mechanisms for exchange, collaboration and shared governance to facilitate smooth cooperation between supply and demand-side activities, including the Open Internet Stack, towards a common platform approach across industrial actors, including a repository with critical mass of largely open-source building blocks, as well as maintenance and support services.

Scope: The expected scope of the CSA for this governance mechanism to function would be the following:

- Consolidate priorities and maximise benefits across different demand perspectives and timelines for key infrastructure services to be implemented.
- Ensure alignment of demand and supply side strategies and roadmaps, in line with (and contributing to) the White Paper on communication infrastructures and other relevant EU policy.
- Ensure coordination and integration of the work of the actions on the supply side pilot and the Open Internet Stack.
- Open-source delivery of Telco Edge Cloud building blocks by the supply side pilot, which will be the foreseen backbone to articulate the cooperation among supply- and demand-side LSPs.

- These open-source modules should be aligned with industrial interests and where appropriate with common European building blocks including with the developments at IPCEI-CIS Telco Edge Cloud community initiatives (e.g. Sylva, Anuket, Nephio and CAMARA).¹⁴⁹
- The demand-side developments in the relevant verticals will offer a continuous feedback loop to the supply side endeavours, while they will benefit from the progressive developments of the supply LSP.
- Provide a foundation for exploitation of European technology developed under the 3C initiative as an alternative to the platforms led by large multinationals. The project should provide a forum for consultation and input of the demand-side application sectors and verticals into the development of the supply-side architecture and building blocks.
- Identification of paradigms shifts evolving in relevant vertical domains like virtual worlds as a driver for emerging network virtualisation and performance as well as vertical services like mobility, communities or energy.
- Assessment of monetising edge computing, interoperability of middleware and SW framework through trend scouting on markets, value chains and ecosystems in the area of dynamic content delivery, AI adoption for telco operation and edge computing, convergence across the telco-cloud-edge- IoT continuum.

Proposals are expected to build synergies with relevant topics under Digital Europe Programme (DEP) and Connecting Europe Facility (CEF).

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

HORIZON-CL4-2025-03-DATA-10: Roadmap for next generation computing technologies from IoT device level to edge to cloud to HPC (CSA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.80 and 2.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility</i>	The conditions are described in General Annex B. The following

¹⁴⁹ Sylva – Linux Foundation Projects Site (sylvaproject.org); Camara Project – Linux Foundation Project.

<i>conditions</i>	exceptions apply: Subject to restrictions for the protection of European communication networks.
-------------------	---

Expected Outcome: The CSA action should be prepared, managed and coordinated by key stakeholders in the field. Proposal results are expected to contribute to the following expected outcomes:

- Support structure for the European Computing ecosystem: networking events (including conferences, summer schools etc.) and vision workshops for the academic and industrial computing community;
- Yearly updated roadmaps on computing addressing the area from a broad perspective from edge-IoT device to edge cloud to cloud to HPC, from scientific to industrial to societal and research applications, and addressing all relevant aspects such as real-time, security, support to artificial intelligence, use of generative AI for computing system engineering, etc.

Scope: To support the European Commission and the European computing constituency by providing to them annually updated roadmaps for research and innovation related to computing. This topic is overarching and building the bridge between Destinations 3 (heading “From Cloud to Edge to IoT for European Data”), Destination 4 (“Ultra Low Power Processors”), as well as the Joint Undertakings (JU) on Chips, Smart Networks and Services, and high-performance computing (HPC). This effort builds on the achievements and structures established by the HIPEAC project and think tank of renowned European research centres on computing “at large” and their key experts. Both the academic visions as well as the industrial perspective complementing the Strategic Research and Innovation Agendas of the JUs as well as the roadmapping done by the European Alliance for Industrial Data, Edge & Cloud as well as the IPCEI exploitation office should be taken into consideration.

HORIZON-CL4-2025-03-DATA-11: Open Internet Stack: development of technological commons/open-source 3C building blocks (RIA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.
<i>Type of Action</i>	Research and Innovation Actions

<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>Subject to restrictions for the protection of European communication networks.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. The maximum amount to be granted to each third party is EUR 400 000 to allow 1/ cases where a given legal entity may receive several grants (e.g. from different calls) 2/ reaching the maturity level for third party's project to ensure sustainability with multiple awards.</p> <p>To support and mobilise internet innovators, a maximum of 70% of the total requested EU contribution could be allocated to financial support to third parties, selected through open calls.</p>

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- A publicly available and operational stack of strategic commons focusing on internet technologies for trust, transactions, connectivity, and decentralisation implementing the European vision of next generation digital infrastructures, in particular the 3Cs networks (in close cooperation with the 3Cs large scale pilots), and the wider Web 4.0.
- A library of inclusive, trustworthy, interoperable, and human-centric applications and services leveraging Open-Source commons building blocks which will increase the value of the network in the respect of European values. These Open Source solutions will be integrated and tested / validated in the 3C large scale pilot.
- A flourishing European ecosystem of contributors to digital commons– e.g., individuals, SMEs, academics - stimulated by critical challenges around sovereignty, trust, and user empowerment.

Tools, services, and insights supporting compliance with and implementation of EU legal framework e.g., EUDI, CRA, DMA, DSA, GDPR, Data Act, DGA.

Scope: This action will foster an Open-Source framework, developed through commons, i.e. Open Source software governed by communities of contributors, that will provide key technology components for the operation of the 3C large scale pilot. They will be addressing relevant areas, structuring them in a stack and supporting the development of 3C building blocks making them available through a library of digital commons supporting applications on top of the European providers ecosystem.

It will mainly cover three technology areas:

- Trust technologies such as privacy enhancing technologies, AI-based agents and trusted technologies for identities allowing exchanges across multiple 3C networks, providing the users with transparent, auditable, secure, and resilient building blocks and tools across the internet stack.
- Network and connectivity technologies according to the identified needs of the 3C large scale pilot.
- Decentralised technologies for an immersive world notably based on open standards ensuring interoperable flow of data and events across the 3C pilot networks and operators.

In order to implement the European vision of next generation digital infrastructures (3Cs networks), applicants should devise appropriate mechanisms for cooperation with the 3C pilot:

- To ensure the integration of requirements and specifications stemming from the 3C large scale pilots.
- To ensure the 3C large scale pilot's swift integration of the building blocks developed by the Open Internet Stack, including envisaging mechanisms for testing and integration of the solutions.

Applicants should provide concrete plans on how such work should be organised in close cooperation with the 3C large scale pilot to decide the building blocks that will be prioritised, facilitate their integration in the 3C large scale pilot and avoid any duplication of the work. If applicants opt for financial support to third parties, the solutions selected under the Open Calls should form a coherent portfolio and duplications should be avoided. The 3C CSA will ensure co-ordination and monitoring for duplication risks across the 3C projects' activities.

Applicants could also decide to select and fund third party projects, wherever required, through up to 70% of their project's budget for financial support to third parties.

If applicants opt for financial support to third parties, they should target calls towards the Open-Source communities actively influencing the course of the Internet. This action is aimed in particular at leveraging the European Open Source community – SMEs, research institutes and individual researchers and developers – with solid experience with development of solutions in line with EU rules and values. The calls should aim at improving trust, transactions, decentralisation implementing optimal balance between distribution, security (including AI for security), AI usage and energy efficiency targeting climate neutrality objectives. Applicants should then also define the mechanisms for maturing third parties' projects e.g., security and accessibility audits, packaging of the stack for easy deployment, localisation of the software in EU languages, documentation best practices, performance optimisation and advising on licensing.

Applicants should detail the path to growth for third parties' projects e.g., by actively animating communities, creating momentum among like-minded efforts, defining how

projects will gain critical mass and what services will be provided for reaching such stage. Proposals should also detail the strategy for standardisation.

In addition to contributing to the 3C large scale pilot, applicants should demonstrate how the software produced will be operationalised as a stack of open libraries accessible through a common European repository and maximising re-use, reproducibility, and resilience for adopters.

Applicants should actively manage the portfolio of funded projects and provide a coherent overall picture in relation to the 3Cs objectives, describing how mature solutions are and ensuring trusted and easy deployment capabilities for each building block through packaged stack.

Applicants should strive for identification of common tools and stimulate maximum re-use of components coming from other funded projects e.g., interoperable identity and credential management tools, common packaging solutions, tools for decentralised social media.

Applicants should seek active collaboration with other initiatives addressing internet commons of relevance to 3Cs at national, European levels and beyond Europe including with European technology industries.

Applicants should demonstrate their experience and understanding of Open-Source communities and their expertise covering the full Open-Source life cycle through proven track record including years of experience and indication of volume of Open-Source projects supported.

The Commission considers that proposals in this topic with an overall duration of typically 36 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

Financial support to third parties

Third parties will be funded through projects typically in the EUR 50 000 to 150 000 range per project, with indicative duration of 9 to 12 months. The consortium should provide the programme logic for the third-party projects, managing the projects lifecycle, and provide the necessary technical and non-technical support: these tasks cannot be implemented using the budget earmarked for the financial support to third parties.

HORIZON-CL4-2025-03-DATA-12: Preparing the Advancement of the state of the art of submarine cable infrastructures (CSA)

Call: DIGITAL - CNECT
Specific conditions

<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.90 and 2.10 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.10 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway, associated countries, OECD countries and MERCOSUR countries.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, shall not participate in the action.</p>

Expected Outcome: Defining specific R&I roadmap at EU level to enhance the cooperation between the EU authorities and other stakeholders and establish leadership in all relevant submarine cable technology domains (EU research roadmap on submarine cables infrastructures, i.e. including any infrastructure related to its construction, operation, maintenance and repair). This CSA should be prepared, managed and coordinated by the key stakeholders in this field, including industry, research and academic stakeholders.

The project should take into consideration the overarching challenges of:

- Reinforcing European leadership and cooperation in submarine cable connectivity, with European capabilities and best practices shaping future connectivity standards, promoting their secondary use (e.g. for a pre-warning system of natural hazard) as well as synergies and collaboration with CEF-Digital backbone projects;
- A digital and green transition towards low carbon footprint of connectivity platforms through principles of the circular economy, including reduction of pollution,

regenerating natural systems etc. while targeting long-term sustainability, resilience and security of submarine cable networks;

- Ensuring resilience for the most demanding cases requiring a very high grade of quality of service (QoS) and performances, and
- Risk evaluation, preparedness and prevention against any future natural or man-made damage or deliberate sabotage.

Against this background, the objectives of the target support actions are outlined below:

- Analysis and definition of the expected critical hardware and software components of future submarine cable infrastructure systems, and indication on where Europe should seize opportunities and strengthen its capabilities, taking into account the characteristics and architectures, including components, security, and operations of future submarine connectivity infrastructures;
- Definition of the main required R&I work and assessment of associated research investment needs related to the identified domains;
- Definition of an appropriate industry roadmap (SRIA), in close partnership with relevant EU actors both from industry and academia, indicating research & innovation actions to be undertaken in priority, their scope, and a timetable showing the main milestones and targets. The project could envisage organising thematic workshops to consult all interested communities. The results of this action will feed into the work of relevant groups working on submarine cable infrastructures, such as the European Submarine Cable Expert Group, the NIS 2 Coordination Group or the CER Group.

Scope:

- Enabling technologies applicable to submarine connectivity infrastructures and systems, including its secondary use for pre-warning systems against natural hazards, are increasingly important to ensure Europe's strategic autonomy as well as economic security. Achieving such goals requires that Europe remains at the technological edge not only with regards to the cable technology itself but also all the other critical elements composing the submarine cable infrastructure such as repeaters, landings stations, operational control centres, underwater acoustic sensor networks (UASN) or cable communications cybersecurity.
- While some of the necessary research is indirectly conducted through mainstream research activities in generic technologies (e.g., optical communications or network management software), more specific research is needed to address the particular needs and advancement of submarine cable infrastructures and systems. However, the specific research needs still need to be identified, which supports the need to develop a specific roadmap and SRIA for research and innovation in submarine cable technologies. Such research efforts may address some of the following (non-exhaustive) domains: Multi-core fibre (MCF) technology, Digital Signal Processing, repeater systems, intelligent

sensing, advanced Digital Acoustic Sensing (DAS), strain and temperature sensing, oceanographic sensors for continuous, real-time trans-oceanic measurements (monitor water body), logical layer and cable network management systems, underwater robotics to improve the construction, maintenance and repair of submarine cable infrastructures, and other innovations, such as wireless sensor networks (WSN) to monitor permanently submarine cable infrastructure and to detect possible threats.

Projects are expected to develop synergies and ensure complementarities with projects under CEF Digital, the Digital Europe Programme (DEP) and the Smart Networks and Services (SNS) Joint Undertaking.

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

AI-GenAI / Data / Robotics

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-03-DATA-13: Fostering Innovative and Compliant Data Ecosystems (IA) (AI, Data and Robotics Partnership)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 7.00 and 9.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 45.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway, associated countries and OECD countries.</p>

	For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, shall not participate in the action.
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 6-7 and achieve TRL 8 by the end of the project – see General Annex B.

Expected Outcome: The projects are expected to contribute to the following outcomes:

- Easing the compliance process of businesses and professionals with the relevant EU legislation, in particular reporting obligations, and alleviating administrative burdens for businesses and professionals.
- Developing and integrating advanced technologies for data collection, data sharing and data analytics for simplifying and automating compliance.
- Generating, managing, and leveraging synthetic data to improve fitness for purpose; addressing limitations of real-world data, enhancing data quality, diversity, and representativeness, while mitigating bias and addressing other ethical issues.
- Ensuring broad user training and support for rolling out and scaling up “compliance and privacy by design” and the FAIR¹⁵⁰ principles in the constantly evolving regulatory landscape.

Scope: As the European Union (EU) legislation continues to expand, both in the digital (GDPR, Open Data Directive (ODD), Data Governance Act, AI Act, Data Act) and non-digital realm (e.g. green deal, due diligence, healthcare, transport), businesses and professionals face increasing challenges in maintaining compliance. Also, the complexity and volume of reporting obligations are growing, posing difficulties for both regulatory bodies to enforce laws and for entities trying to comply. These challenges underscore the need for innovative solutions to streamline compliance processes and enhance competitiveness within the EU.

Another current challenge are limitations of real-world data such as issues with availability, confidentiality, and bias. Synthetic data is becoming increasingly vital in addressing these problems. By generating and utilizing synthetic data, actions within this framework aim to enhance data quality, diversity, and representativeness, making it a crucial tool for AI-powered innovation and regulatory compliance.

Where relevant, the actions should address **cybersecurity, interoperability, reproducibility and standardization**, and/or liaise with other actions working on those aspects, in view of

¹⁵⁰ FAIR: Findable, Accessible, Interoperable and Re-usable data

facilitating effective data sharing across platforms and sectors, while ensuring an adequate level of security and protection.

Actions should provide necessary comprehensive **user training and support**, (also involving the users/stakeholders outside the project), ensuring adaptability and scalability to accommodate evolving regulations and diverse organizational needs and to raise awareness and improve understanding of relevant compliance issues. Proposals for all three areas should analyse and address the real needs of real users and stakeholders, and how these will be addressed in the proposed action. The training and user needs should be linked to tangible progress indicators in the proposal.

The proposal should clearly state (in the abstract and in the introduction) which of the following three areas it addresses. A proposal can address more than one area, but it should indicate one of them as the main focus of the proposal, and it will be evaluated accordingly under that area.

- Area 1: Actions to develop advanced compliance technology integrating AI, cybersecurity, language technologies, and privacy preservation. This framework could include the creation of NLP¹⁵¹-driven semantic analysis tools for deciphering complex legal texts and translating them into clear compliance tasks, energy-efficient neuromorphic approaches and mechanisms for optimising massive data operations, or machine learning algorithms trained on historical data to predict and mitigate potential compliance violations. With the capability to detect changes in EU legislation, these advanced AI systems and analytics tools will provide deep insights into compliance performance, risk management, and help forecast upcoming regulatory trends to strategically prepare for future requirements. For usability, it is also important that the tools can be integrated with the organisation's existing processes and systems.
- Area 2: Actions to ensure auto-compliance of data transactions and data spaces with applicable regulation (e.g. data and sectoral legislation). Actions in this area should anticipate compliance tasks within the context of Common European Data Spaces and coordinate with them as necessary. Actions in this area are expected to develop automatic or semi-automatic tools that analyse and take into account the specific architecture, governance model, exchange mechanisms, tools, data types, identity management, smart contracting, user policies and other user needs or operational features of the actual data spaces, liaising with and building on other actions working in this area, in particular the Data Spaces Support Centre.
- Area 3: Actions to generate, manage and leverage **synthetic data** in order to improve data quality, availability, representativity, fitness for purpose and compliance. The actions should in particular address the inherent shortcomings of real world data that would necessitate synthetic data (e.g. data availability, confidentiality, privacy protection, enhancing quality, diversity, representativeness, bias). Additionally, actions may target generating synthetic data for sparse or unusual domains, integrating synthetic and real

¹⁵¹ NLP: Natural Language Processing

data effectively, or advancing technological capabilities in generative models and simulation-based approaches to drive synthetic data generation forward and/or addressing or modelling rare events and complex dynamic systems. All actions under this Area are expected to address the evaluation, validation and benchmarking of synthetic data to ensure fitness for purpose and safe, ethical and compliant use of synthetic data, including the analysis and mitigation of biases inherited from the original data or introduced by the synthetic data generation process. For these purposes, collaboration with simulation/digital twins actions could be explored.

This topic implements the co-programmed European Partnership on AI, Data and Robotics.

Projects are expected to develop synergies with Digital Europe programme topics implementing Common European Data Spaces, especially the Data Spaces Support Centre (DSSC). Projects are expected to ensure complementarities with projects funded under the following topics:

- HORIZON-CL4-2024-DATA-01-01 AI-driven data operations and compliance technologies (IA).
- HORIZON-CL4-2021-DATA-01-01 Technologies and solutions for compliance, privacy preservation, green and responsible data operations (RIA).

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

HORIZON-CL4-2025-04-DATA-02: Empowering AI/generative AI along the Cognitive Computing continuum (RIA) (AI/Data/Robotics Partnership)

Call: DIGITAL - HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 8.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global</p>

	<p>context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.¹⁵²</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 6-7 by the end of the project – see General Annex B.

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- **Novel AI-enabled Cloud and Edge management solutions** tailored for the processing needs of AI workloads across the cognitive cloud-edge-IoT continuum.
- Strategic industrial cooperation across the Cloud-Edge-IoT cognitive computing continuum to support future **hyper-distributed AI applications**.

¹⁵²

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

- Seamless and trustworthy integration and interoperability across diverse computing and data environments spanning from core cloud (including HPC) to edge to IoT and across different technology stacks.
- Enhanced openness and open strategic autonomy in the evolving data and AI-economies across the computing continuum **validated through key business/societal sectors**.
- Guaranteeing a minimum level of interoperability and portability thereby facilitating European access to foreign markets.

Scope: The Cloud to Edge Continuum needs to provide seamless and trustworthy integration of diverse computing and data environments spanning from core cloud to edge to IoT and support the enormous data, processing needs, and new resource types brought by next generation AI technologies.

Different types of AI processes pose different requirements that compute infrastructures need to meet to execute them. The state-of-the-art in generative AI and large language models is heavily reliant on high-performance processing and very large AI models. Cutting-edge hardware accelerators that power these processing systems are scarce on the market and only available in highly specialised, high-performance infrastructures in certain cloud and HPC environments at considerable costs. At the same time, the requirement to gather, process, and transmit massive amounts of data to the central data processing environment remains a barrier for many AI applications. All these factors urge the emergence of efficient tools and mechanisms **to empower the distribution of AI training and inference processes throughout the computing continuum**.

Empowering the next generation AI technologies with on-demand, agile and situation-aware infrastructure that brings data- and computing power to where and when it is needed will let end-users exploit Artificial Intelligence across the computing continuum without compromising on security and trust and optimising their energy use. These **challenges** span various aspects of the continuum, including **on-device data processing, data orchestration and sharing, AI integration, decentralised intelligent management, decentralized and global optimization, energy and resource heterogeneity support, data management, security/privacy, and synergies with 5G/6G**. Addressing these challenges is crucial for realizing the vision of a cognitive cloud-to-edge continuum as a key enabler for any emerging trends such as AI/generative AI.

The Cognitive Computing Continuum could eventually be extended to **include other computational resources**, such as **HPC**, and provide abstraction layers to maximize the benefits of available hardware.

Addressing all the above complexities calls for innovative research to overcome these challenges. **The aim is to develop generic and AI-enabled cloud-edge technologies encompassing the whole computing continuum to empower the development of AI/generative AI technologies and applications**. The proposals should demonstrate the generic applicability of the proposed technological solutions across various application

domains such as but not limited to, manufacturing, healthcare, robotics, transportation and smart cities.

The following (one or more) research areas should be addressed:

- **Development of novel mechanisms for the efficient development, deployment, and operation of AI workflows** across heterogeneous and distributed infrastructures along the Edge to Cloud to HPC continuum that optimise training times, model accuracy and data management while factoring in performance metrics such as memory usage, energy efficiency, application processing and data transfer latency, and network overheads. These should factor in virtualisation and orchestration techniques that seamlessly integrate heterogeneous processor architectures and cater for the explainability of the applied cognitive optimisations.
- **Decentralised and federated computing continuum tools and mechanisms to enable distributed AI architectures.** These include scheduling, orchestration, and placement mechanisms that leverage the wide range of Edge computing environments available in the compute continuum, including on-device edge. Tools and mechanisms should take into consideration - where appropriate - data security and privacy aspects. The focus is on enhancing AI process execution through techniques such as model, data, hybrid parallelism and data compression, gossip, swarm, and federated training, or conditional computing.
- **Cloud and edge processing tools and techniques to reduce AI processing power usage and emissions across the cognitive computing continuum,** relying on hardware efficiency (for example, thanks to special-purpose accelerators and heterogeneous hardware processor architectures) and energy optimisation techniques, such as hardware and software approximation.

This topic implements the co-programmed European Partnership on AI, Data, and Robotics.

Projects are expected to develop synergies and relate to activities and outcomes of the Digital Europe Programme (DEP) and any existing or emerging Important Projects of Common European Interest (IPCEI) initiative, such as IPCEI-CIS.

All proposals are expected to share communicable results with the European R&D community, through the AI-on-demand platform, and if necessary other relevant digital resource platforms in order to enhance the European AI, Data and Robotics ecosystem through the sharing of results and best practice.

HORIZON-CL4-2025-04-DATA-03: Software Engineering for AI and generative AI (RIA) (AI/Data/Robotics Partnership)

Call: DIGITAL - HADEA
Specific conditions

<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 15.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.¹⁵³</p>

¹⁵³

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity,

<i>Technology Readiness Level</i>	Activities are expected to start at TRL 4 and achieve TRL 6 by the end of the project – see General Annex B.
-----------------------------------	--

Expected Outcome:

- Improved methods and tools to optimally develop and deliver bias-free AI algorithms and generative AI.
- New concepts of the auto-evolution-enabled software elements that AI algorithms can autonomously select and integrate.

Scope: The latest developments in AI are demanding computation infrastructures designed to maximize the number of FLOPS. Europe has a window of opportunity to leverage open source and ensure that the European industry is at the cutting edge of these new processing infrastructures. The current methods and tools to develop and efficiently deliver AI pipelines and complex generative AI applications present several shortcomings.

Current identified challenges include the continuous management of data pipelines, novel testing methods (e.g. differential testing or improved performance testing), optimized deployment strategies (in terms of using energy efficient resources or the best performant), management of dependencies with a diverse set of types of hardware, algorithm bias and discrimination against certain groups, determined by characteristics such as gender, ethnicity, age or disability, as well as the maintenance of the effectiveness of AI applications, notably generative AI ones. The explainability of AI models is another crucial challenge that must be also tackled at the software engineering level, possibly in synergy with explainability methods at the machine learning stage. Also, large language models and foundational models require the development and operation of complex system architectures that need to handle data processing at large scale, continuous training of models and inference. Furthermore, AI pipelines and generative AI application also strongly suffer from poor protection against learning dataset poisoning, as well as prompt poisoning; software engineering methods and tools providing support to protect against those attacks are thus direly required. This presents novel challenges for developers that will need to be addressed with the development of new methods, mechanisms and tools covering the above, including neuromorphic computing, but not limited to.

The main objectives for the advancements of Software Engineering in this field are:

- Increasing the productivity of generative AI application developers, and operators, especially of foundational and language models.
- Define a reference architecture and framework for generative AI application developers to simplify integration and system modularity.
- Simplifying and automating the development and operation of such applications.

and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

- Including novel techniques for the generation of labelled training sets for reinforcement learning (RL) from human feedback, to be evaluated with corresponding RL algorithms.
- Facilitating AI progress and advancement beyond the state-of-the-art in the EU at a faster rate vis-à-vis the rest of the world and contributing to the implementation of the AI Act.
- Establishing collaboration with EU-based chips designers to maximize how the hardware resources are fully optimized with the software to develop

The proposal should address at least one use case as an industry application (e.g., automotive, health, energy, food/agriculture, etc.).

Actions could build on, provide support or seek collaboration with existing projects, develop synergies and ensure complementarities with other relevant European, national or regional initiatives currently demanding this kind of optimisations possibly in different verticals: e.g. digital twins leveraging GenAI, data quality enhancement leveraging GenAI, development of energy-efficient AI algorithms.

Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

This topic implements the co-programmed European Partnership on AI, data and robotics (ADRA), and all proposals are expected to allocate tasks for cohesion activities with ADRA, and the CSA HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub.

Actions are encouraged to build on, provide support or seek collaboration with existing projects, develop synergies and ensure complementarities with other relevant European, national or regional initiatives currently demanding this kind of optimisations possibly in different verticals: e.g. digital twins leveraging GenAI, data quality enhancement leveraging GenAI, development of energy-efficient AI algorithms. In particular, proposals are encouraged to ensure complementarities with projects funded under the following topics:

1. HORIZON-CL4-2024-HUMAN-03-01: Advancing Large AI Models: Integration of New Data Modalities and Expansion of Capabilities
2. HORIZON-CL4-2024-HUMAN-03-02: Explainable and Robust AI (AI Data and Robotics Partnership) (RIA)
3. HORIZON-CL4-2023-DATA-01-01 AI-driven data operations and compliance technologies (IA)
4. HORIZON-CL4-2021-DATA-01-01 Technologies and solutions for compliance, privacy preservation, green and responsible data operations (RIA)
5. HORIZON-CL4-2021-HUMAN-01-24 - tackling gender, race and other biases in AI.

Projects are encouraged to develop synergies and relate to activities and outcomes of the Digital Europe Programme (DEP) and any existing or emerging Important Projects of Common European Interest (IPCEI) initiative.

DRAFT

Destination 4: Achieving open strategic autonomy in digital and emerging enabling technologies

Destination 4 ensures Europe's strategic autonomy while preserving an open economy in those technologies that will be key for a deep digital transformation of industry, public services and society, while fully playing its enabling role in the twin transition. As set out in the European Chips Act, the top-priorities are to i) strengthen processes undertaken at critical stages in the semiconductor and quantum chips value chain, including chip design and manufacturing technologies, and ii) address the use of new materials and green technologies, energy efficiency and the integration of circularity and life-cycle assessment.

Destination 4 will address high value-added hardware needs for core, cloud and edge, fast-sensing, low-latency and high-bandwidth data transmission, and help secure the supply of critical components for key markets, such as automotive, health, automation and mobility systems. For this purpose, significant human capacity will be required in chip manufacturing to ensure: (i) the strengthening of processes undertaken at critical stages in the value chain; and (ii) that workers can take up quality jobs created as part of these priorities, including through the activities undertaken by the joint undertaking initiative.

In addition, future needs in microelectronics (such as performance, size, cost, energy efficiency, environmental impact, new materials, concepts, architectures, integration) may also be addressed to make sure Europe's microelectronics industry remains competitive. Opportunities may come from non-volatile memories, spintronics, in-memory computing, neuromorphic and other emerging technologies. Photonics research will lead to fast and versatile sensing and imaging, and energy-efficient building blocks for networks and data centres. The cluster will also push for chip-level integration of photonics and optoelectronics.

The cloud/edge/internet of things will be transformed into an agile and situation-aware infrastructure that brings data to where and when it is needed. Within these smart digital infrastructures, end-to-end artificial intelligence, from the core to the edge and across all technology layers, will be key for on-demand supply of optimal data-, communication-, and computing resource orchestration, with optimal use of energy while preserving privacy and ensuring resilience. European sovereignty in the cloud-edge server market will be strengthened through the power of open-source software, complementing the RISC-V based European Processor Initiative that aims to increase Europe's independence in high performance computing hardware.

Cluster 4 will transform the user experience. It will push the frontiers of virtual and extended realities (VR/XR) and of open, human-centric virtual worlds for industry, entertainment and arts, public services and people alike, e.g. by leveraging social innovation. It envisages a vibrant R&I ecosystem that strategically joins-up research and development on sophisticated VR/XR optics and displays, multimodal human-computer interaction, authoring tools, real-time spatial computing, rendering, integration and application research. Improved sensing, fast processing and low-latency will be challenging for the underlying cloud/edge/Internet of things. Along similar lines, the way in which the virtual world meets the physical world will continue to evolve, thanks to all kinds of robots and other smart devices that involve self- and

context awareness, spatial intelligence, exploiting the best in bias-free AI, engineering and design for game-changing physical characteristics, functional or cognitive capabilities, acute perception, autonomy and safe interaction.

Artificial intelligence underpins many of these changes and Cluster 4 will strengthen and consolidate R&I in this area. For example, today's generative models are a preview of how virtual worlds and multimodal user-experiences could be produced on-demand. Research on core learning and analysis techniques (incremental, frugal and collaborative), as well as next generation smart robotic systems, will keep Europe at the cutting edge of AI. Artificial Intelligence is also key to keep the competitiveness and strategic autonomy of the EU scientific sector. The EU's comprehensive approach to achieving leadership in AI is reflected in its Apply AI Strategy, which aims at establishing Europe as a global leader in the development and adoption of AI. By fostering a vibrant AI ecosystem, the EU seeks to make Europe a hub for AI innovation and growth, where world-class AI models are developed and integrated into strategic sectors. This initiative is designed to drive innovation, economic growth, and competitiveness, while ensuring that the benefits of AI are shared by all. The topics related to Generative AI included in this destination will support the implementation of the GenAI4EU initiative included in the AI Innovation Package of 24 January 2024. They constitute, moreover, an integral part of the broader Apply AI strategy. By aligning these efforts with the GenAI4EU initiative and the Apply AI strategy, the EU aims to create a cohesive and coordinated approach to AI development and adoption, one that promotes European excellence and leadership in this critical field.

Europe's long-term competitiveness in the digital area requires continuous scouting and early, low-TRL cross-disciplinary work on new and emerging technologies, dissociated from the main roadmaps. This would encourage collaboration in research and cross-fertilisation between disciplines and sectors on new approaches in: (i) microelectronics; (ii) power electronics; (iii) photonics and photon/phonon/spin/electron integration; (iv) unconventional, hybrid, neuromorphic, nature-inspired or bio-intelligent paradigms; and (v) novel systems and infrastructure architectures.

Europe's strength in quantum technologies (including in quantum communications and optical satellite communications, etc.) is a strategic asset for its future security and independence. Cluster 4 supports early and mature quantum technologies and stimulates their industrial uptake, e.g. through experimentation and testing environments for integrating them into standard industrial design and manufacturing. Equally transformative, two-dimensional materials (2DM) could positively affect many industries, including ICT. While further exploring the vast range of 2DMs, Cluster 4 will also work towards completing a fully European supply chain and scaling up the development and piloting of 2DM technologies and devices for more industrial fields.

Quantum and High Performance Computing

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-03-DIGITAL-EMERGING-01: Continuation of the Quantum Technologies Flagship (CSA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 4.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 4.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>Subject to restrictions for the protection of European communication networks.</p>

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

1. Act as a global observatory of quantum technologies, systematically reporting on the latest advancements and breakthroughs occurring worldwide. Provide regular assessments to the European Commission and Member States, specifically to the Quantum Technologies Coordination Group established in line with the Quantum Declaration, offering a detailed analysis of Europe's standing relative to global competitors. This will ensure Europe can strategically respond to emerging trends and innovations.
2. Capitalize on the accomplishments and infrastructure (e.g. online presence) established by the current CSA to further elevate Europe's leadership in quantum technologies.
3. Provide comprehensive support to Flagship projects, researchers, and innovators, fostering synergies, knowledge sharing, and best practices.
4. Develop and implement targeted communication strategies to raise awareness and understanding of quantum technologies across varied audiences, including students, specialists, and the general public.
6. Promote the sustainable growth of quantum technologies in Europe by exploring new applications and markets, ensuring the field's dynamism and competitiveness.
7. Serve as a pivotal entity for coordinating efforts between the EU and Member States, especially in light of the new Quantum Declaration. This includes aligning national and European strategies and enhancing international relations to fortify Europe's stance in the global quantum landscape.

8. Assist the Flagship's governance bodies and facilitate the integration of new structures or initiatives, ensuring a cohesive and efficient approach to advancing quantum technologies in Europe.
9. Act as a globally-oriented data observatory for quantum technologies, systematically collecting data (e.g. on patents, scientific publications and the current and future evolution of markets for quantum technologies) related to the state of quantum technologies in Europe and worldwide. Once or twice a year, this data should be disseminated to stakeholders, including the Commission and Member States, as well as countries associated to Horizon Europe.
10. Propose a clear, service-oriented model detailing the CSA's offerings to various stakeholders, including research support, data business intelligence, strategic analysis, international collaboration facilitation, event organization, and communication activities.
11. Update the Strategic Research and Innovation Agenda through a community-based process involving research and industry stakeholders.

Scope: The scope of the new Quantum Flagship CSA encompasses:

1. The global observatory role of quantum technologies, systematically reporting on the latest advancements and breakthroughs occurring worldwide.
2. Fulfil the dissemination requirement of five articles every two months highlighting EU success stories in quantum technologies. These articles should be widely promoted in Europe and beyond via social media, popular newspapers, and technical magazines to ensure maximum visibility and impact.
3. Building upon the established infrastructure by the previous CSA, support the European Commission and current and future projects within the Quantum Flagship, including organisation of events and ensuring they have access to the necessary resources and expertise.
4. Developing comprehensive communication plans tailored to different target audiences, enhancing the visibility and understanding of quantum technologies and their societal implications.
5. Acting as a central hub for coordinating actions between the EU, Member States, and international partners. This involves compiling and disseminating information critical for harmonizing strategies at different levels.
6. Providing support to the Flagship's governance structures, contributing to the smooth execution of its strategic vision and operational goals. This may include aiding the establishment and integration of new bodies or initiatives.
7. Contribute to the organisation of the European Quantum Technologies Conference (EQTC). The conference is due to be hosted by the country holding the Presidency of the Council of the European Union in the third quarter of each year (2026-2029).

The Commission considers that proposals with an overall duration of typically 48 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations.

The project should aim to link to the activities of relevant standards development organisations with e.g. participation of project beneficiaries in the relevant standards technical committees. The Commission encourages the inclusion of partners with direct experience –of participation in relevant standards committees at national, European or international level(s) in project consortia.

Proposals are encouraged to build on, or seek collaboration with, existing projects and develop synergies and complementarities with other relevant European, national, or regional initiatives and funding programmes. In particular, links are encouraged with:

- the project funded under the topic HORIZON-CL4-2021-DIGITAL-EMERGING-01-32: Support and coordination of the Quantum Technologies Flagship Initiative (CSA) – QUCATS project;
- all relevant quantum technologies-related projects funded under Horizon Europe and Digital Europe, and as part of the EuroQCI initiative, EuroHPC Joint Undertaking and Chips Joint Undertaking.

Proposals should also cover synergies with other relevant European, national, or regional initiatives and funding programmes such as those mentioned above.

Proposals should also contribute to spreading excellence across Europe; for example, through the involvement of EU Widening Countries.

In this topic the integration of the gender dimension (sex and/or gender analysis) in research and innovation content is not a mandatory requirement; however, should proposers consider it to be of relevance for their proposal, they are strongly encouraged to integrate it.

HORIZON-CL4-2025-03-DIGITAL-EMERGING-02: Quantum Computing – complementing the quantum computing FPAs with the development of a technology agnostic software stack (RIA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.

<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.¹⁵⁴</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3-4 and achieve TRL 5-6 by the end of the project – see General Annex B.

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

¹⁵⁴

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

1. Establishing a universal, interoperable quantum computing ecosystem that supports diverse hardware platforms through the creation of a technology-agnostic software stack.
2. Seamlessly integrating quantum computing with classical computing systems, including HPC and cloud services (including the EuroHPC Joint Undertaking's supercomputers, and the quantum computers and simulators already integrated into them), and demonstrating practical quantum computing applications by showcasing use cases that combine quantum and classical computing capabilities
3. Advancing the development of standardized software architectures, compilers, and simulators that ensure application portability and performance across different quantum computing platforms.
4. Demonstration of workflows that effectively combine quantum and classical computing to address complex computational challenges, providing clear examples of the added value of quantum acceleration or showing a quantum advantage.
5. Support for initiatives aimed at training software developers in quantum programming and developing libraries for basic quantum algorithms, including the integration of quantum error correction mechanisms.

This topic emphasizes the strategic importance of collaboration between Horizon Europe quantum computing software and hardware projects and the EuroHPC Joint Undertaking's quantum projects, including high-performance computing-quantum middleware, integration, and Quantum Excellence Centres. Successful applicants will be required to closely collaborate and agree on the interfaces for the main layers of the software stack at the beginning of their projects. It is crucial that the projects collaborate from the outset to define open interfaces for the main layers of the software stack. These interfaces should be open for consultation and incorporate input from existing initiatives to ensure they are well aligned with current developments in the field. All interface specifications should be properly documented as they will serve as the foundational basis for the development of different layers and facilitate seamless collaboration across projects.

In line with the European Commission's commitment to open access and reuse of software, when possible, all developments under this call should utilize open-source software platforms and be published in open repositories such as GitHub. Additionally, the use of appropriate software licenses, such as those listed as free by the Free Software Foundation and listed as open source by the Open Source Initiative, or under the European Union Public Licence (EUPL), is strongly recommended.

Moreover, the beneficiaries will have to ensure open access to other research outputs like data and workflows under the principle 'as open as possible and as closed as necessary' and in accordance with the FAIR (Findable, Accessible, Interoperable, Reusable) data principles.

Scope: Quantum APIs and cloud access form the transition layer between users and quantum machines in the quantum computation stack. This layer includes general-purpose quantum software development kits that are used to implement quantum algorithms for both gate-based

systems, simulators and quantum annealers. This call seeks proposals that address the creation of a cohesive software stack that is agnostic to quantum hardware, facilitating the development, testing, and deployment of quantum applications across various platforms.

Proposals are encouraged to build on, or seek collaboration with, existing projects, and develop synergies and ensure complementarities with other relevant European, national, or regional initiatives and funding programmes. In particular, links are encouraged with the following, as well as with the EuroHPC Joint Undertaking:

- HORIZON-CL4-2021-DIGITAL-EMERGING-02-17: Framework Partnership Agreement for developing large-scale quantum simulation platform technologies (FPA)
- HORIZON-CL4-2021-DIGITAL-EMERGING-02-15: Framework Partnership Agreement for developing the first large-scale quantum computers (FPA)
- HORIZON-CL4-2023-DIGITAL-EMERGING-01-43: Framework Partnership Agreement for developing large-scale quantum Computing platform technologies (FPA)
- HORIZON-CL4-QUANTUM-02-SGA - Developing large-scale quantum simulation platform technologies (SGA)
- HORIZON-CL4-QUANTUM-01-SGA - Developing the first large-scale quantum computers (SGA)

In addition, proposals are expected to develop synergies with relevant projects funded under the Digital Europe Programme (DEP).

Proposals should also contribute to spreading excellence across Europe; for example, through the involvement of EU Widening Countries.

In this topic the integration of the gender dimension (sex and/or gender analysis) in research and innovation content is not a mandatory requirement; however, should proposers consider it to be of relevance for their proposal, they are strongly encouraged to integrate it.

HORIZON-CL4-2025-03-DIGITAL-EMERGING-03: Supporting Digital Partnerships in Quantum technologies (RIA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.50 and 2.70 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 8.00 million.

<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 2-3 and achieve TRL 3-5 by the end of the project – see General Annex B.

Expected Outcome: The overall objective of this call is to support the implementation of the EU-Republic of Korea Digital Partnership by strengthening cooperation with the Republic of Korea (ROK) in quantum technologies, in the areas identified in the Partnership.

Project results are expected to contribute to the following expected outcomes:

- Strengthening the European quantum ecosystem, enabling stakeholders to enhance quantum technologies' applications in academic, industrial, and relevant cases for the EU and ROK.
- Improving the exchange of information and expertise between EU and ROK to tackle societal challenges utilizing quantum technologies.
- Sharing best practices in deploying quantum technologies and integrating them with other technologies.
- Facilitating researcher and engineer exchanges between the EU and ROK for mutual access to quantum infrastructures.
- Enhancing international cooperation between the EU and ROK quantum communities, with a roadmap for future collaboration in targeted areas.

Scope: Proposals are expected to address quantum technology challenges in the fields of quantum communication, computing, simulation, and sensing, identifying the added value and mutual benefits for both EU and Korean partners. This includes integration across various disciplines such as physics, engineering, computer science, cybersecurity, theory, algorithms, software, manufacturing, control, and infrastructures.

Relevant technological and societal challenges to address include:

- Co-design of hardware and software to accelerate quantum computing and simulation applications, ensuring interoperability across platforms and foundational quantum algorithm and architecture theories.
- Development of secure quantum communication protocols, including quantum key distribution and beyond, with a focus on device-independent protocols, quantum network architecture, and certification of quantum states.

- Application-specific quantum sensor development, covering areas like device fabrication, characterization for purposes like navigation, imaging, and biomedical applications, and optimizing sensor control and advanced approaches.

Proposals are recommended to link to the activities of relevant standards development organisations, e.g. via participation of project beneficiaries in the relevant standards technical committees. The Commission encourages the inclusion of partners with direct experience of participation in relevant standards committees at national, European or international level(s) in project consortia.

Proposals should contribute to spreading excellence between the EU and ROK, through the balanced involvement of EU and ROK entities.

Proposals should clearly define the benefit of EU-ROK collaboration, aiming to enhance the technology readiness level (TRL) through comprehensive engineering approaches involving public and/or private partners.

Proposals should also contribute to spreading excellence across Europe; for example, through the involvement of EU Widening Countries.

In this topic the integration of the gender dimension (sex and/or gender analysis) in research and innovation content is not a mandatory requirement; however, should proposers consider it to be of relevance for their proposal, they are strongly encouraged to integrate it.

HORIZON-CL4-2025-03-DIGITAL-EMERGING-04: Post-exascale HPC (CSA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.

Expected Outcome: The CSA action should be prepared, managed and coordinated by key stakeholders in the field. Project results are expected to contribute to the following expected outcomes:

- Delivery of a high-quality roadmap addressing the post-exascale HPC/AI research challenges for applications, algorithms, software, hardware and systems, including a strong emphasis on AI
- Contribution to the development of a competitive European converged HPC/Quantum/AI ecosystem, including AI Factories and future AI Gigafactories
- Interaction and collaboration with similar international efforts, ensuring alignment with AI-driven computing paradigms worldwide

Scope: Proposals are invited for a Coordination and Support Action that will guide and prepare European HPC for the post-exascale era of converging supercomputing, quantum computing and artificial intelligence worlds.

The action should bring together the key scientific and industrial players in Europe, ensuring strong AI engagement, and should liaise with the relevant international post-exascale efforts (e.g. the International Exascale Project (InPex)), the EuroHPC Joint Undertaking advisory bodies such as the Research and Innovation Advisory Group (RIAG) and the Infrastructure Advisory Group (INFRAG), the EuroHPC JU private partners (i.e. the European Technology Platform for High Performance Computing ETP4HPC, the Big Data Value Association (BDVA), and the European Quantum Industry Consortium (QuIC)), relevant EuroHPC main initiatives (e.g. the DARE Framework Programme Agreement on RISC-V processors, HPC Centres of Excellence, AI Factories, etc), the hosting entities of European AI Factories and future AI Gigafactories, and other relevant European projects and initiatives.

The action should analyse the research challenges of all relevant technologies in the post-exascale/AI era and produce and maintain a high-quality research roadmap with recommendations for research actions at the European level. Issues like hardware-supported mixed-precision, AI-driven HPC as a service, real-time HPC, next generation AI model training and inference, digital continuum, convergence of HPC/AI/Quantum/Cloud/Edge, should be part of the analysis.

The Commission considers that proposals with an overall duration of typically 24/36 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations. Only one proposal will be selected for funding.

In this topic the integration of the gender dimension (sex and/or gender analysis) in research and innovation content is not a mandatory requirement; however, should proposers consider it to be of relevance for their proposal, they are strongly encouraged to integrate it.

Projects are expected to develop synergies with relevant projects funded under the Digital Europe Programme (DEP).

Photonics

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-04-DIGITAL-EMERGING-01: Advanced sensor technologies and multimodal sensor integration for multiple application domains (IA) (Photonics Partnership)

Call: DIGITAL - HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 25.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 7 by the end of the project – see General Annex B.

Expected Outcome: Photonic sensor technologies enable precision and versatility in sensing across multiple domains. The integration into multimodal systems enhances data accuracy, speed and reliability. Advancements in photonic sensors and their multimodal integration aim to elevate diagnostics, monitoring, and sensing by improving efficiency, performance, and reliability while reducing size and manufacturing costs and power consumption.

The development of sensor technologies and multimodal integration is closely aligned with several key EU policies. These include achieving open strategic autonomy in digital and emerging enabling technologies, enhancing Europe's technological sovereignty, and supporting the twin transition to a digital and green economy by promoting energy-efficient, competitive, and resilient digital infrastructures.

The initiative also aims to advance the digital transformation by providing access to high-quality environmental data, supporting the development of technologies for privacy, compliance, and data integrity to empower decision-making and foster a fair data economy.

Lastly, it contributes to the green transition by leveraging photonic sensor technologies for environmental monitoring and sustainable practices. It aligns with the EU's objectives for a green and digital economy, enhancing system operations and promoting innovation in eco-friendly practices, thus strengthening Europe's technological leadership for societal and economic progress.

Projects are expected to contribute to at least three of the following outcomes to fully exploit the potential of photonics for a digital, green and healthy future in Europe:

- Increase the efficiency of developed photonic sensors, surpassing existing technologies in aspects such as energy consumption, data acquisition and processing speed, as well as measurement accuracy.
- Significantly reduce the size, weight, or footprint of the sensors and quantify advancements over current technologies.
- Improve both intrinsic and extrinsic performance metrics to boost measurement accuracy for at least three use-case scenarios.
- Extend the sensing and testing capabilities of photonic sensors by linking optical with non-optical measurement parameters (e.g. for acoustic sensing or electromagnetic sensing).
- Contribute to reducing manufacturing costs and increasing resource-efficiency, while also enhancing reliability and durability of the targeted sensor systems.

They are additionally expected to:

- Help secure the open strategic autonomy for Europe by ensuring intellectual property and production means of key technologies are maintained within the EU, reducing dependencies and enhancing negotiation power in technological cooperation.
- Help maximise international competitiveness by increasing the uptake and translation of photonic technologies into new products and services, guided by key technology requirements.

Scope: The scope of this topic focuses on the advancement and application of photonic sensor technologies and their integration into multimodal systems. Proposals are expected to address the development of sensor technologies and their validation through trials in realistic use cases. This includes exploring multi-modal sensor capabilities, as well as employing sensor fusion and machine learning approaches for the analysis of sensor data. Techniques should address at least two different technology approaches, i.e. sensor modalities, of which at least one must be photonic from the following areas:

- 3D sensing and imaging such as LIDAR, optical coherence tomography (OCT), optical tomography, interferometry, photoacoustics, etc.
- Communication fiber sensing
- Chemical and gas sensing
- Bio- and medical sensing and/or imaging
- Particle sensing

- Integrated photonic solutions

In addition, the proposals could focus on developing and integrating algorithms designed to enhance the processing capabilities and decision-making accuracy of photonic sensors. These algorithms may help to optimize the interpretation of complex sensor data, enable real-time analytics, ambient intelligence and adaptive responses in dynamic environments.

Furthermore, projects should aim to provide significant improvements in one or more of the application domains listed below and to demonstrate these in at least three use case scenarios. Demonstrators would be expected to reach TRL 4-5 while the photonic techniques would be developed up to TRL 7.

This expectation underlines the call's objective to foster innovations that have a substantial and beneficial impact on society and various industry sectors:

- Healthcare (medical diagnostics, disinfection, treatment through improved imaging techniques and diagnostic accuracy).
- Transportation Safety (enhanced safety features in automotive and aerospace industries through better sensing capabilities).
- Industrial efficiency and sustainability (industrial processes such as manufacturing, quality control, increasing precision and automation through improved sensing technologies).
- Agricultural/Food Sector (precision agriculture, food safety, food waste reduction and supply chain management through improved sensing techniques for monitoring crop health, detecting contaminants, and optimizing production processes and raw material utilisation).
- Environmental Monitoring and sustainable energy (pollution monitoring, climate research, renewable energy infrastructure and natural disaster mitigation).
- Security, safety and resilience of people and critical infrastructure (face identification, long distance observation by day and night, (infra-)structural health monitoring, chemical and gas sensing, explosive detection)
- Protection and efficient operation of optical communications, risk management of data transport and processing including increased resilience to cyber security.

Proposals submitted under this topic should include a business scenario and exploitation strategy.

Research must build on existing standards or contribute to standardisation. Where relevant, interoperability for data sharing should be addressed.

All projects should build on or seek collaboration with existing projects and develop synergies with other relevant European, national or regional initiatives, funding programmes and platforms, in particular the Digital Europe Programme (DEP).

Semiconductors

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-03-DIGITAL-EMERGING-08: Strengthening the fabless Start-up and SME ecosystem in Europe (CSA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 1.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 1.00 million.
<i>Type of Action</i>	Coordination and Support Actions

Expected Outcome: Proposals should result in an enhanced and integrated support instrument for fabless startups, SMEs and mid-caps that drives collective growth and innovation. The outcomes should include:

- A sustainable and active organization or network that represents the interests of European fabless SMEs (e.g. the consortium could form an open industry association).
- A comprehensive framework facilitating dialogue between fabless SMEs and European stakeholders, including public authorities and key industrial actors, to address sector-specific needs and challenges.
- A platform providing fabless SMEs with easy access to up-to-date information on relevant calls and funding opportunities, policy and regulatory developments, as well as key technological updates.
- Active representation of fabless SMEs in high-profile forums and events, to strengthen their role and influence within the European semiconductor ecosystem.
- Targeted services to support startup acceleration and scaling, with emphasis on advanced semiconductor technologies, such as chips for AI, low-power computing, autonomous driving, integrated photonics, etc.

This CSA invites proposals that can foster a collaborative and inclusive European fabless ecosystem, capable of thriving in a dynamic global market.

Scope: Fabless semiconductor start-ups and SMEs play a key role in driving innovation and economic growth within the global technology sector. These companies, which design chips and outsource their manufacturing, are at the forefront of technological advancements, fueling innovative developments in semiconductor technologies related to AI, data processing, communications, automotive, and more. Globally, fabless companies contribute to approximately 50% of chip revenues. However, Europe's share in this crucial market is less than 1%, highlighting a significant gap that needs to be addressed to strengthen Europe's strategic autonomy and economic security. European fabless startups and SMEs often face significant challenges in accessing cohesive and timely information, financial resources, and relevant infrastructures and services. Nurturing and supporting the growth of European fabless SMEs is essential for building a competitive ecosystem that fosters rapid innovation, job creation, and sustainable growth. This Coordination and Support Action (CSA) aims to bridge this gap by providing targeted support and advocacy for Europe's fabless semiconductor start-ups, SMEs and small mid-caps, ensuring their voice is heard and their potential is fully realized.

The CSA will support European fabless start-ups, SMEs and mid-caps by establishing a coordination and knowledge hub to foster collaboration, improve access to strategic resources, and bridge the gap between them and decision-making entities. The proposed actions will aim to:

- Establish a sustainable organization or network, potentially through the formation of an open industry association, to represent the interests of European fabless SMEs.
- Promote dialogue and advocacy between fabless SMEs and European stakeholders, including public authorities and policymakers, while representing their interests with key industrial actors (such as foundries, EDA vendors, and design houses) as well as relevant initiatives of the Chips for Europe Initiative, the Chips Joint Undertaking and the IPCEIs on Microelectronics.
- Enhance the visibility and engagement of fabless start-ups and SMEs in EU policy-making to leverage their innovation potential, strengthening Europe's leadership in critical industry domains and in advanced semiconductors such as for AI, HPC, quantum, communications, advanced sensing, power systems and autonomous driving technologies and applications.
- Align with relevant support actions in key EU programmes, including coordination with the network of the European Semiconductor Competence Centres and the Design Platform under the "Chips for Europe Initiative".
- Develop a central platform (a one stop-shop) for semiconductor start-ups and SMEs that aggregates and disseminates all essential information they need (e.g., policy updates, public and private funding opportunities, and technological advancements) and facilitates access to funding and investment opportunities.

- Organize and participate in events, including workshops and conferences, to enhance the profile of fabless startups and SMEs, and strengthen their role in the broader European semiconductor ecosystem.
- Foster partnerships and innovation through networks that connect start-ups and SMEs, promoting cross-sector knowledge-sharing and joint projects to advance technological solutions and business growth.

The action should be coordinated and driven by the relevant representative European start-up and SME stakeholders operating in the field.

AI-GenAI / Data / Robotics

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-03-DIGITAL-EMERGING-07: Robust and trustworthy GenerativeAI for Robotics and industrial automation (RIA) (AI/Data/Robotics & Made in Europe Partnerships)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 40.00 and 45.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 85.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the</p>

	<p>Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.¹⁵⁵</p> <p>The following additional eligibility criteria apply:</p> <p>A minimum of EUR 10 million of the EU funding requested by the proposal must be allocated to financial support to third parties.</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 2 and achieve TRL 6 by the end of the project – see General Annex B
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio grants will be awarded to applications not only in order of ranking but at least also to one proposal that is the highest ranked within Type A and Type B, provided that the applications attain all thresholds.</p>
<i>Legal and financial set-up</i>	The rules are described in General Annex G. The following

¹⁵⁵

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

<i>of the Grant Agreements</i>	<p>exceptions apply:</p> <p>Beneficiaries must provide financial support to third parties (FSTP). The support to third parties can only be provided in the form of grants. In derogation to article 208 EU Financial Regulation, the maximum amount to be granted to each third party can exceed EUR 60,000 and reach up to EUR 500 000. This derogation is justified by the high cost intensity of the substantial human resources, equipment or data acquisition required to successfully carry out the research and innovation activities planned in the FTSP actions.</p> <p>A given action supported by such FSTP scheme can be implemented by one third party or a by consortium of entities. The maximum amount to be granted to each action implemented by a third party or by a consortium is up to EUR 2 million.</p>
<i>Exceptional page limits to proposals/applications</i>	<p>In order to include a business case and exploitation strategy, the page limit in Part B of the General Annexes is exceptionally extended by 3 pages.</p>

Expected Outcome: Proposals are expected to address one area of the expected outcomes, either Type A or Type B. The type should be clearly identified within the proposal.

Type A GenAI4EU¹⁵⁶: Generative AI for Robotics for industrial automation. Project results are expected to contribute to all the following expected outcomes:

- Development of advanced foundation models for robotics, fostering increased autonomy and generalization capabilities, thus enabling robots to dynamically learn and comprehend their physical surroundings in real-time, ensuring adaptability and reliability across diverse and complex scenarios.
- Validation of the model through fine-tuning and downstream application to address industrial automation use-cases

Type B Trustworthy and robust generative AI for improved manufacturing. Project results are expected to further advance foundation models and reliable industrial solutions and to contribute to some of the following expected outcomes, depending on the use-cases addressed in the proposals:

- Increased productivity by high quality, flexible and resource-efficient industrial automation, both on the shop floor and in engineering/business processes;

¹⁵⁶ GenAI4EU is an initiative launched in the context of the AI innovation package, fostering the development of innovative Generative AI solutions to support the competitiveness of Europe's strategic sectors and industries: <https://digital-strategy.ec.europa.eu/en/news/commission-launches-ai-innovation-package-support-artificial-intelligence-startups-and-smes>

- Significantly improved facilitation of product and process certification and compliance assessment, as well as reliability, efficiency and sustainability of manufacturing processes, supporting easier high-mix production and manufacturing of products based on sustainable and advanced technologies; and
- Significantly facilitated installation, commissioning and decommissioning of production facilities, through tools that enable faster industrialisation of factory automation well beyond the pilot phase, while reducing the need for manual on-site interventions.
- Applicants will justify their selection by the expected business dimension of their use cases, while ensuring a critical mass of resources in the project to ensure significant outcomes in these.

Scope: Proposals integrating Generative AI in robotics and industrial automation are expected to substantially contribute to productivity gains, including for instance in engineering industries, the automotive sector, food production or other sectors related to manufacturing industries. All proposals will have to demonstrate their expected impact on the competitiveness of the selected application sector.

The budget will be split in a balanced way between area Type A and Type B defined below. Proposals should clearly identify the area they are addressing.

Proposals aiming for Type A outcomes should adhere to the Type A scope, while proposals aiming for Type B outcomes should follow the Type B scope.

Type A Scope: While it is widely acknowledged that current use of generative AI has the potential to impact certain tasks in robotics such as improving user interaction or providing explanations about why a robot system made a particular decision, these are, in general, not within the critical operating flow of a robot. To reach next level of autonomy, generative AI must also enable robots to learn from their experiences, simulate realistic environments for training in challenging conditions, and enhance planning, decision making and control while considering the physical constraints imposed both by the environment and by the physical construction of the robot. This includes integrating 'Human-in-the-loop' mechanisms, where AI systems collaborate with human operators to enhance decision-making processes and adaptability, particularly in dynamic environments.

This represents a significant advancement in robotics, requiring the development of AI models that can effectively navigate the complexities of the physical world while ensuring safety. Generative AI is expecting to bring such a step-change in robots precision, adaptability, versatility and robustness, enabling them to efficiently achieve real world tasks such as complex moves (navigation, manipulations, etc.) with higher level of autonomy and precision.

In the context of advancing robotics capabilities, the use of generative AI stands as a transformative force, amplifying robots' learning, interaction, and operational abilities. By enabling robots to learn from experiences, simulate diverse environments for training, and enhance human-robot interaction, it drives adaptability and efficiency. Additionally,

generative AI facilitates the augmentation of robot situational awareness and planning capabilities, empowering them to predict outcomes of various actions, thereby elevating their autonomy and decision-making prowess.

Training current generative AI models, in particular Large AI models, requires high volumes of data to achieve effective levels of performance. The vast amount of data required present a significant challenge when it comes to robotics. Further research is necessary to find the appropriate balance between the quality, adequacy, and volume of data with regards to the performance of the AI model. Moreover, model distillation techniques may play a key role for the portability of the generative AI solution at the edge, in power-limited devices. The training data should come from the real world or from physical aware simulations of the real world. Where relevant, in particular in the context of human interaction, training data should encompass diverse individual characteristics, such as gender, age, racial and ethnical background, to mitigate potential bias and discriminations.

Proposals should detail strategies to leverage cutting-edge generative AI techniques to enhance the adaptability and reliability of these models across complex and dynamic scenarios, as well as how to ensure human-centricity and environmental considerations. The goal is to train and fine-tune generative AI models that meet the necessary standards for ensuring the safe operation of robotics hardware. These models should empower robots to autonomously plan and execute actions while maintaining high levels of performance and generalization capabilities.

Research activities should explore the training methodologies for these foundation models, emphasizing their ability to process multimodal data and derive actionable insights to inform robotic decision-making processes.

The proposals are also expected to include the validation of the trained models through applications. Proposals should detail methodologies for conducting rigorous testing procedures, incorporating both simulation-based evaluations and physical experiments. These tests aim to evaluate the performance and scalability of developed foundation models.

The research will be driven by impactful scenarios defined by major manufacturing industry players who should be well integrated in the consortium. They should be deeply involved in the proposed work in order to provide the use-case, the corresponding data and they will play an important role to accompany the validation process. They will define a number of representative real-world use-cases with gradually increased level of complexity to drive the technology development. They will provide existing relevant data and collect further data necessary to train and fine-tune the models, but also to validate the solutions. Given the sensitivity of sharing industrial data, manufacturers present in the consortium have to define upfront mechanisms to collectively provide and pool a sufficiently large dataset for training the models (this might involve a trusted third party as intermediary), ensuring sufficient quality and quantity of data needed to train the models. If necessary, they will have to put in place mechanisms to acquire data from sources outside the consortium.

Proposals are expected to enhance the accuracy and robustness of generative AI systems in robotics, ensuring that the solutions developed are trustworthy and reliable in their applications, hence in line with the AI Act requirements.

Proposals should address both the safety of robotic operations, ensuring protection against physical risks, and cybersecurity measures to safeguard against digital threats and ensure system integrity.

The emphasis lies in creating and disseminating general-purpose models and tools rather than being limited to narrowly focused solutions. Projects should also build on or seek collaboration with existing and upcoming projects and develop synergies and ensure complementarities with other relevant European (e.g. projects funded under HORIZON-CL4-2024-HUMAN-03-01: Advancing Large AI Models: Integration of New Data Modalities and Expansion of Capabilities), national or regional initiatives, funding programmes and platforms.

Type B Scope:

The objective is to enhance productivity and provide a competitive advantage to EU industry in the transition towards more sustainable, zero-carbon production, addressing the uncertainties and tensions on supply chains and the lack of highly-skilled workers. A new generation of digital technologies will integrate generative Artificial Intelligence, robotics, and advanced human interfaces in industry-grade applications with a high degree of autonomy. This will enable the development, production, and operation of complex and advanced high-tech products at lower cost while improving sustainability and flexibility, ultimately becoming a powerful tool for accelerating innovation in both processes and products.

The manufacturing sector should strongly benefit from increased levels of automation made possible by breakthroughs provided by AI, in particular by the family of technologies known as generative AI, including (e.g.) AI foundation models, large language models, transformers, multimodal generative AI. The main objective of this Type B is the development of Generative AI solutions dedicated to the manufacturing sector and making use of manufacturing data available in production lines.

Proposals should address at least one of the following use-cases:

- 1) Robustness and trustworthiness of digital technologies and data management at industry-grade quality, to raise the automation levels on production sites and across industry and supply chains;
- 2) Enhanced product and process qualification/certification and compliance assessment through higher levels of automation, digitalisation and data management, taking into account related requirements;
- 3) Automation of manufacturing processes to achieve higher reliability, efficiency and sustainability;

4) Automated tools for fast and large-scale deployment and reconfiguration of production assets and for rapid innovation cycles.

Proposals should accomplish these objectives exploiting the most suitable approach(es) among the ones described below:

- The integration of applications exhibiting advanced developments of generative AI model(s) specifically designed for manufacturing, providing measurable advantages in one of more of these key areas: manufacturing cost, increased productivity, quality, flexibility, resilience, sustainability, circularity, time to market and usability. Applications can target factory-floor operations and/or management of data, knowledge and documentation associated to products and production (for use-case 1 or 2);
- Development and integration of digital production systems capable of significantly increasing productivity and managing high-mix production with close to zero time needed for re-purposing and capability to manage different mixes of materials and components (for use-case 3);
- Development of deployment tools to automate the management of production lines, namely through automatic configuration, integration with legacy systems, placement of data translators and connectors, and deployment of machines and sensors on the shop floor (for use-case 4).

Proposals should indicate which approach they are targeting. Proposals may combine several approaches above, indicating which is the main approach, provided there is added value in such a combined approach; arbitrary combinations without integration are excluded.

The use of generative AI techniques is encouraged for all the approaches. The applicants will specifically describe how they will secure the acquisition of quality manufacturing data from real-world industrial use cases of industry partners or companies outside the consortium in the context of the data volume necessary to train and finetune the models used in the proposal.

Type A and Type B

For both Type A and Type B projects, proposal should allocate up to EUR 30 million towards the development of the foundation model. Each project is anticipated to focus on up to six use cases.

A minimum of EUR 10 million of the proposal budget must be allocated via FSTP for the fine-tuning phase. This phase aims to create Generative AI applications tailored to impactful industry-driven use cases.

- FSTP may be foreseen for up to EUR 2 million per use case, either for a single company (including SME/Start-up), user industry providing their data and use-case, or to a small consortium complementing such user industry company with one or two additional partners, such as AI developer/integrator. Such FSTP initiatives will develop mini-projects, working in close collaboration with the consortium partners, that will dedicate

sufficient resources to support such FSTP projects, in order to develop advanced applications and demonstrate with quantitative KPIs the power of Generative AI solutions. These mini-projects will include data preparation, fine-tuning, validation of the Generative AI solution in the selected impactful use-cases.

Proposed projects should aim to develop models that align with European values and principles and regulation, including the AI Act. Research should build on existing standards or contribute to standardisation, particularly addressing the needs and requirements of the industry.

Where relevant, interoperability for data sharing should be addressed, focusing on open specifications and standards, enabling effective cross-domain data communities, and new data-driven markets.

If high computing resources are necessary, for both Type A and Type B proposals the primary source of computing resources for pretraining should be sought from external high-performance computing facilities such as EuroHPC or National centres. The proposal should describe convincingly the strategy to access these computing resources.

When possible, proposals should build on and reuse public results from relevant previous funded actions. Additionally, proposals should leverage the tools available for the AI and robotics community on the AI on demand platform. Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

This topic implements the co-programmed European Partnerships on AI, Data, and Robotic (ADRA) and Made in Europe and all proposals are expected to allocate tasks for cohesion activities with ADRA and the CSA HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub.

Proposals should also build on or seek collaboration with existing projects and develop synergies with other relevant International, European, national or regional initiatives.

HORIZON-CL4-2025-03-DIGITAL-EMERGING-09: Challenge-Driven GenAI4EU Booster (RIA) (AI/Data/Robotics Partnership)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 15.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 45.00 million.

<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.¹⁵⁷</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve at least at TRL 3 and achieve at least TRL6 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio covering the different strategic sectors,</p>

¹⁵⁷

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

	grants will be awarded to applications not only in order of ranking but at least also to one proposal that is the highest ranked within (i) the aerospace sector, (ii) the pharma/drug development sector, and (iii) the telecommunication sector, provided that the applications attain all thresholds.
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Grants awarded under this topic will be linked to the other actions granted under this topic. A collaboration agreement will required.</p> <p>Beneficiaries must provide financial support to third parties. The support to third parties can only be provided in the form of grants. In derogation to article 208 EU Financial Regulation, the maximum amount to be granted to each third party can exceed EUR 60,000 and reach up to EUR 250 000 per competing solution. This derogation is justified by the substantial resources required to successfully carry out the challenges planned in the project in the stage 2, that should be substantiated in the proposals. This amount is granted at the end of the first stage of the challenge to the 20 winning solutions, as a grant to prepare for the stage 2 of the challenge.</p> <p>Each competing solution to be developed in stage 2 is proposed either by a single start-up/SME or a small team of organisations built around such start-up/SME, therefore the EUR 250 000 is distributed accordingly.</p>

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Significant technology progress and innovation through challenge-driven approach in the fields of aerospace, pharma/drug development or telecommunication networks.
- Increased competitiveness and visibility of the Generative AI community in Europe, in demonstrating their capability to achieve challenging tasks within the aerospace, pharma/drug development or telecommunication sectors.
- Increased adoption of Generative AI in aerospace, pharma/drug development or telecommunication networks through tangible progress and achievement demonstrated via the challenge-driven process.

Scope: Generative AI (GenAI) promises to transform most industry sectors. This challenge-driven initiative aims to boost both Europe's developer community and the adoption of powerful trustworthy generative AI solutions in the strategic sectors of aerospace, pharma/drugs and telecommunication networks, key for their competitiveness. In pharmaceuticals, it can, for instance, accelerates drug design by rapidly creating target-

specific molecules, reducing development time from years to seconds, and potentially preventing prolonged health crises like COVID-19. In aerospace, generative AI can for instance optimize aircraft design, streamline manufacturing processes, predict maintenance needs through sensor data analysis, route optimisation, and enhance pilot training with diverse, realistic simulations. By embracing generative AI, telecom companies can position themselves at the forefront of a new era of intelligent and automated telecommunications. Specific use-cases include for instance network management, network optimization, network slicing, network healing, predictive maintenance, network mapping and optimization.

Each proposal should focus exclusively on one of the three key sectors mentioned above: aerospace, pharma/drug development, or telecommunications and clearly specify which sector it addresses. Each proposal is expected to focus primarily on the definition, the organization of a multi-stage competition in the chosen sector, as well as the accompanying support to the companies/teams taking part in the challenges, and related activities to maximise the impact of the action.

User industry companies from the strategic sector targeted by the proposal should be core partners in the consortium. They should demonstrate a genuine interest in the projects results and therefore support the challenge participants - in order to reach the most powerful and exploitable results benefitting their industry. The expected results are pre-competitive but the proposal must include a draft exploitation plan outlining commitments on future exploitation. The consortium is responsible for the various stages of the challenges and should provide the necessary support resources during each stage of the competition, including technical assistance and business support to develop an exploitation strategy, but most importantly, provide the data necessary to fine-tune models and build powerful solutions meeting industry needs.

Proposals should be driven by impactful use-cases where generative AI can make the difference: a number of industries from the targeted sector are expected to join forces to define challenging problems to solve with GenAI solutions, which then drive the rest of the project. Based on such challenges, the consortium organises a multi-staged competition with an increasing level of complexity. In the first two stages, third parties, either single companies (typically start-ups or SMEs) or small team of organisations built around such start-ups/SMEs, compete to address the challenges with GenAI solutions. After these stages, the solutions retained for the last stage will be invited to join the consortium, as full beneficiaries.

For each proposal:

- Stage 1: a challenge, open to all, will allow to select for stage 2 the 20 highest ranked solutions, according to a pre-defined selection process and criteria. Each solution competing for the challenge can be submitted either by a single start-up/SME, developer of GenAI solutions, or a small team of organisations built around such start-up/SME
- Stage 2: the 20 solutions selected from stage 1 receive EUR 250 000 FSTP funding, in form of a grant, in order to address the challenge set for this stage by the consortium. At

the end of stage 2, the 4 highest ranked competing solutions will be selected for the next stage according to a pre-defined selection process and criteria.

- Stage 3: after the end of stage 2 and the corresponding FSTP scheme, the 4 selected solutions will be invited to join the consortium and receive EUR 2 millions grants each (as part of the eligible costs of the grant agreement) to prepare for the grand finale. The consortium should define measures to maximise the impact for the team winning the grand finale at the end of the third stage, and maximise the uptake of their solutions (for instance, the best performing team could be offered the opportunity to conclude partnerships or contracts with the user industries leading the consortium. Measures to support the broad uptake of their solutions in the whole sector should also be considered).

Such multi-staged scheme is expected to be implemented in parallel by the successful proposals, each addressing a different sector.

Each proposal, involving several major industry players, should define a clear methodology to implement the various steps of the approach, define the specifications of the stages of the competitions, timelines, targets, KPIs, a solid evaluation methodology including evaluation criteria. The main information should be in the proposal, even if refinements could be further developed during the project. The proposers will also be in charge of implementing the evaluation methodology, and providing the necessary infrastructure/technical support for the participants to the challenges. The consortium members are also responsible for ensuring high visibility of the competitions, including possible sponsorships.

The actions selected from this call, each addressing one of the three targeted sectors, are expected to collaborate among themselves, in order to make economies of scale in sharing best practices, defining processes for organising the challenges, ensuring efficient monitoring, organising dissemination and communication activities, etc. Such collaboration among the linked actions is expected to be formalised by a collaboration agreement, after the Grant Agreement signature.

For each proposal, an amount of EUR 5 millions is foreseen to be distributed among the winners of stage 1, in form of FSTP grants, in order to prepare for stage 2. In addition, a budget of EUR 8 millions is reserved in the initial grant, to carry out the stage 3 of the challenge. The proposal is expected to make the case for such investment in defining the objectives with sufficient level of information, even if the details are to be further elaborated in the course of the project. Such amount will be distributed equally among the 4 winning teams of the stage 2, who will be invited to join the consortium as beneficiaries to develop further the solutions and compete for the stage 3 of the challenge.

Visibility would be important; therefore dissemination and communication campaigns are key. The proposers are also encouraged to seek sponsorship, which would be key for the visibility and prestige of their challenge, and to attract the best developers from the EU and associated countries to compete, particularly SMEs and startups, alone or within a team competing for the challenges.

All proposals are expected to incorporate mechanisms for assessing and demonstrating progress, including qualitative and quantitative KPIs, benchmarking, and progress monitoring. This should include the methodology to accompany the challenge participants to the various stages during the project, and the assessment methodology during the various selection stages. As part of the KPIs, efficiency gains from Generative AI should be considered, to maximize broader impact.

When possible, proposals should build on and reuse public results from relevant previous funded actions. Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

This topic implements the co-programmed European Partnership on AI, data and robotics (ADRA), and all proposals are expected to allocate tasks for cohesion activities with ADRA and the CSA HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub.

Proposals should also build on or seek collaboration with relevant projects¹⁵⁸ and develop synergies with other relevant International, European, national or regional initiatives.

HORIZON-CL4-2025-04-DIGITAL-EMERGING-04: Assessment methodologies for General Purpose AI capabilities and risks (RIA) (AI/Data/Robotics Partnership)

Call: DIGITAL - HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.00 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 7.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global</p>

¹⁵⁸ In particular, proposals in telecommunication should exploit potential synergies with projects funded under HORIZON-CL4-2025-03-DATA-08, HORIZON-CL4-2025-03-DATA-09 and HORIZON-CL4-2025-04-DATA-02; proposals in pharma/drug should exploit potential synergies with relevant projects from Cluster 1 and IHI Innovative Health Initiative; proposals in the aerospace should exploit potential synergies with relevant projects from the clean aviation JU and other similar projects/initiatives.

	<p>context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.¹⁵⁹</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 2 and achieve TRL 5 by the end of the project – see General Annex B.

Expected Outcome: Project results are expected to contribute to some of the following expected outcomes:

- New assessment and validations methodologies developed allowing to evaluate General Purpose AI (GPAI) models, including multimodal systems, and systems' capabilities and risks.
- Use of the research outcomes by GPAI providers, policymakers, public institutions, and other relevant stakeholders to evaluate GPAI models and systems' capabilities and risks.

¹⁵⁹

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

- Support to the AI Office in its function to conduct evaluations of general purpose AI models with a view to enforce the AI Act' rules for general purpose AI models and facilitate self-evaluation for GPAI model developers to ensure compliance with AI Act requirements.

Scope: The rapid advancement of artificial intelligence (AI) has led to the development of increasingly sophisticated general-purpose AI (GPAI) models and systems. These models, such as large language models and multimodal AI systems, demonstrate remarkable capabilities across a wide range of tasks. However, assessing the capabilities of these models remains a significant challenge. Traditional evaluation methods often fail to capture the full spectrum of abilities exhibited by GPAI models and systems. Therefore, there is a pressing need for the development of ***new assessment frameworks, methodologies and tools*** that can comprehensively evaluate these models in terms of their trustworthy and ethical behaviour and operation, ensuring their reliability, fairness, and alignment with human values.

This topic aims to develop robust assessment tools, techniques, and benchmarks specifically designed to rigorously evaluate GPAI models and systems, including multimodal systems. Proposals should cover one or more of the following research areas:

- Innovative methods for proactively identifying and forecasting emergent capabilities in GPAI models and systems. This encompasses the identification of capabilities with both beneficial and potentially detrimental uses.
- Assessment of GPAI capabilities with a significant economic impact or potential for misuse. This includes assessing capabilities that drive beneficial innovation and societal good, as well as evaluating potential risks in areas such as chemical, biological, radiological, and nuclear (CBRN) hazards or cybersecurity threats.
- Developing assessment techniques that illuminate the underlying mechanisms of emergent capabilities in AI systems, emphasising interpretability and explainability.

Projects should generate example benchmark tests to examine trained AI models, systematically uncovering latent capabilities. These benchmarks will be made available to GPAI providers, policymakers, and other relevant stakeholders to implement robust evaluation tools.

This topic strongly encourages the formation of interdisciplinary teams combining the necessary technical expertise. Such a collaborative approach will ensure that assessments accurately capture real-world use cases, including capabilities elicitation techniques, and that the developed frameworks, methodologies and tools are responsive to the concerns of all relevant stakeholders.

This topic requires the effective contribution of SSH disciplines and the involvement of SSH experts, institutions as well as the inclusion of relevant SSH expertise, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

Proposals must adhere to Horizon Europe's requirements regarding Open Science. Open access to research outputs should be provided unless there is a legitimate reason or constraint; in such cases, the proposal should detail how GPAI providers, policymakers, and other stakeholders will access the research outcomes.

All proposals are expected to incorporate mechanisms for assessing and demonstrating progress, including qualitative and quantitative KPIs, benchmarking, and progress monitoring. This should include participation in international evaluation contests and the presentation of illustrative application use-cases that demonstrate concrete potential added value. Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

This topic implements the co-programmed European Partnership on AI, data and robotics (ADRA), and all proposals are expected to allocate tasks for cohesion activities with ADRA and the CSA HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub.

Proposals should also build on or seek collaboration with existing projects and develop synergies with other relevant International, European, national or regional initiatives. Regarding European programmes, projects are expected to develop synergies and complementarities with relevant projects funded under Horizon Europe but also under the Digital Europe Programme (DEP).

HORIZON-CL4-2025-04-DIGITAL-EMERGING-05: Soft Robotics for Advanced physical capabilities (IA) (AI/Data/Robotics Partnership)

Call: DIGITAL - HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 20.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 4 and achieve TRL 7 by the end of the project – see General Annex B.

Expected Outcome: Increased exploitation of novel materials, design methods, and control techniques for soft robotics, enabling the creation of inherently safe and versatile robotic systems with applications in various industries, including healthcare, maintenance, manufacturing, and transportation.

Scope: Soft robotics¹⁶⁰ represents an important avenue to advance robotics, particularly for enhancing safety and physical interaction. Its potential lies in creating systems with intrinsic and functional safety, capable of securely interacting with humans across various scenarios. By using compliant designs, these systems overcome the limitations of rigid robotic systems, such as limited adaptability and reduced safety around humans. Novel design methods, the use of smart materials, deformable physical architectures, and bioinspired approaches are key to improving robotic performance. However, significant challenges remain in learning, modelling, simulation, control, actuation, sensing, and the integration of soft electronics.

To address this, proposals should focus on exploiting novel materials and design methods for non-rigid structures, along with advanced control techniques for soft robotic systems.

Proposals should cover one or more of the following areas:

- Exploitation of novel materials suited to developing robotic systems, both as the main structure and of manipulators and end effectors. These may encompass passive and active materials, and combination materials with specific properties.
- Design methods for non-rigid structures and the means to accurately and sense position where this may no longer involve fixed rotational or linear links
- Control methods for structures built from novel and soft materials or for structures that emulate rigid structures using soft materials.

The proposals should include at least three different demonstrators from different sectors that clearly show the advantage of soft robotics in the context of some chosen application scenarios. The objective is to develop and disseminate general purpose tools and systems, therefore the results should not be limited to the demonstration scenarios selected in the proposals to demonstrate the technological progress.

All proposals are expected to incorporate mechanisms for assessing and demonstrating progress, including qualitative and quantitative KPIs, benchmarking, and progress monitoring. When possible, proposals should build on and reuse public results from relevant previous funded actions. Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

This topic implements the co-programmed European Partnership on AI, data and robotics (ADRA), and all proposals are expected to allocate tasks for cohesion activities with ADRA.

¹⁶⁰ soft robotics concerns the design, control, and fabrication of robots composed of compliant materials, instead of rigid links. Hence such robots can be composed of rigid parts linked by compliant links

Proposals should also build on or seek collaboration with existing projects and develop synergies with other relevant International, European, national or regional initiatives.

HORIZON-CL4-2025-04-DIGITAL-EMERGING-07: Enhanced Learning Strategies for General Purpose AI: Advancing GenAI4EU (RIA) (AI/Data/Robotics Partnership)

Call: DIGITAL - HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 15.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication</p>

	networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees. ¹⁶¹
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 2 and achieve TRL 5 by the end of the project – see General Annex B.

Expected Outcome: Project results are expected to contribute to some of the following expected outcomes:

- Development of General Purpose AI (GPAI) models and architectures demonstrating enhanced capabilities, such as formal reasoning, mathematical problem-solving, confidence level estimation, long-term planning, and seamless adaptation to dynamic and non-stationary environments.
- Innovative learning approaches combining self-supervised learning with hybrid learning, active learning, reinforcement learning, transfer learning, relational learning or continual learning and evolutionary learning.
- Theoretical insights to advance the understanding of synergies between self-supervised and complementary learning paradigms in GPAI model development.

Scope: Current large-scale AI models have demonstrated remarkable capabilities that have transformed numerous fields. They excel at tasks like natural language processing, image generation, and playing complex games. However, despite these successes, current models often struggle in several key areas. They lack the adaptability to seamlessly adjust to changing conditions in real-world environments. Additionally, their reasoning abilities remain limited, when facing complex tasks that require logical deduction, mathematical problem-solving, or multi-step planning. Moreover, current GPAI models frequently fail to recognise their own limitations, leading them to generate erroneous outputs when presented with queries outside their domains of knowledge. These limitations underscore the need for advancements in General Purpose AI (GPAI) that go beyond pattern recognition and towards robust, adaptive systems capable of a wider range of intelligent behaviours, for example, taking inspirations from biological and collective systems.

To push the boundaries of current AI technology, this topic seeks the development of groundbreaking GPAI models that combine self-supervised learning with complementary

¹⁶¹ The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

learning strategies. These strategies include hybrid learning, which integrates symbolic reasoning and knowledge representation; active learning, which allows models to actively seek information to improve their performance; reinforcement learning, which enables models to learn through interaction with their environment; relational learning, which focuses on learning from relational data structures; continual learning, which allows models to continuously adapt and acquire new knowledge without forgetting previous tasks; and evolutionary learning, which draws inspiration from biological evolution to optimize model architectures and parameters; and physics-based learning, which considers physical properties in the models' architectures. By leveraging these complementary approaches, the aim is to create GPAI models that exhibit enhanced capabilities, overcome existing limitations, and pave the way for a new generation of intelligent systems capable of tackling complex, real-world challenges.

This topic prioritizes proposals that explore innovative approaches to developing GPAI models, focusing on at least one of the following key research areas:

- **Hybrid Learning Architectures for Advanced Reasoning:** Development of architectures integrating self-supervised learning with symbolic reasoning, knowledge representation, and neuro-symbolic methods to foster robust reasoning, complex planning, and problem-solving abilities within GPAI.
- **Continual and Evolutionary Learning for Dynamic Environments:** Research on paradigms enabling GPAI models to seamlessly adapt, learn from changing conditions, and retain knowledge essential for operation in dynamic, real-world environments.
- **Reinforcement Learning Integration:** Research on the fusion of self-supervised learning and reinforcement learning to overcome challenges like non-stationary data, algorithm sensitivity, and computational cost.
- **Explainable AI and Trustworthy Decision-Making:** Integration of robust XAI methodologies, exploring causal inference and counterfactual reasoning techniques to enhance transparency, accountability, and responsible use of GPAI models in alignment with European values and principles.
- **Other Novel Paradigms:** Research on the combination of self-supervised learning with other learning paradigms, such as active learning, relational learning, and embodied learning, to equip GPAI models with new advanced capabilities.

Proposed projects should aim for a balanced approach between theoretical advancements and practical applications, with a strong emphasis on the development of GPAI models that align with European values and principles, including the AI Act.

The potential impact of this research extends beyond scientific advancements, as it has the potential to transform key European industries and sectors, including advanced robotics, personalized healthcare, mobility, manufacturing, sustainable energy solutions, and the scientific sector, and to contribute to the EU climate neutrality objective through energy

efficiency. Successful projects will contribute to the development of GPAI models that enhance productivity, improve decision-making, and foster innovation across a wide range of domains.

This topic strongly encourages the formation of interdisciplinary teams combining the necessary technical expertise. Such a collaborative approach will ensure that assessments accurately capture real-world capabilities and risks, and that the developed tools are responsive to the concerns of all relevant stakeholders.

Proposals must adhere to Horizon Europe's requirements regarding Open Science. Open access to research outputs should be provided unless there is a legitimate reason or constraint.

All proposals are expected to incorporate mechanisms for assessing and demonstrating progress, including qualitative and quantitative KPIs, benchmarking, and progress monitoring. This should include participation in international evaluation contests and the presentation of illustrative application use-cases that demonstrate concrete potential added value. Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

This topic implements the co-programmed European Partnership on AI, data and robotics (ADRA), and all proposals are expected to allocate tasks for cohesion activities with ADRA and the CSA HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub.

Proposals should also build on or seek collaboration with existing projects and develop synergies with other relevant European, national or regional initiatives, funding programmes and platforms. Regarding European programmes, proposals are expected to develop synergies and complementarities with relevant projects funded under Horizon Europe but also under the Digital Europe Programme (DEP).

Artificial Intelligence in Science

Proposals are invited against the following topic(s):

HORIZON-CL4-INDUSTRY-2025-01-DIGITAL-61: AI Foundation models in science (GenAI4EU) (RIA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 30.00 million.

<i>Type of Action</i>	Research and Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 1 and achieve TRL 4 by the end of the project – see General Annex B.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio of foundation models from a variety of disciplines, grants will be awarded to applications not only in order of ranking, but also to at least two projects in domain A, and at least one project in each one of domains B, C and D in the scope of this topic, provided that the application attains all thresholds.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁶².</p>

Expected Outcome:

- Accelerate research and development in science, with focus on the domains of a) materials science, b) climate change science, c) environmental pollution science (including PFAS) and d) agricultural science ;
- Advance AI technology (not limited to Generative AI) tailored for scientific needs and potentially adaptable to other tasks in the area of application;
- Contribute to the development of foundation models in the areas of application, and pave the way for future funding of foundation models in a broader range of scientific disciplines;
- Advance solutions to societal or scientific challenges;
- Bridge existing knowledge gaps and induce interdisciplinarity by design across different fields necessary to advance the area of application; and
- Support open-source and open science, especially for research communities with limited access to modern AI tools.

¹⁶² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Scope: Foundation models in science are an evolving idea in the scientific community and go beyond the Generative AI trend¹⁶³. The purpose of this topic is to tap into their potential, and to advance the development of AI technology specifically tailored for the needs of science.

A foundation model¹⁶⁴ can integrate information from various modalities of data. This model can then be adapted to a wide range of downstream, more specialized tasks. To build downstream applications, the foundation model is fine-tuned with additional training and task-specific examples. Therefore, a foundation model is itself incomplete but serves as the common basis from which many task-specific models can be built via adaptation.

In science, such foundation models could be trained on data from a specific scientific field and then be fine-tuned for a variety of tasks and used by a wider community in the field.

Proposals should address **one of the following scientific domains**:

- (A) Materials science: the development of new, innovative and advanced materials is essential for EU's economic security and for achieving a competitive and sustainable industry (especially sectors such as energy, mobility, construction, health and electronics). Employing AI in the process of materials design, characteristics and discovery could significantly accelerate and scale potential innovative solutions.
- (B) Climate change science: advancing climate research is critical for achieving the EU's climate neutrality and resilience goals. AI foundation models can contribute to more accurate insights into climate dynamics, enhanced predictions of extreme weather events, regional impacts and the evolution of climate tipping points.
- (C) Environmental pollution sciences: advancing environmental sciences can support the detection and characterisation of pollution sources, as well as their pathways, distribution and impacts to the environment and human health. This is particularly relevant in the case of pollutants of concern, emerging and/or less known pollutants.
- (D) Agricultural sciences: advancing agricultural sciences research is critical to achieve a competitive, resilient and sustainable agricultural system. AI foundation models can contribute to enhance crop, livestock, soil and water management.

Proposals should focus on 1) developing foundation models (not limited to Generative AI) for science in the chosen domain; 2) showing a foundation model's usefulness by adapting it to

¹⁶³ Some examples in science include: Foundation model in materials science ([\[2401.00096\] A foundation model for atomistic materials chemistry \(arxiv.org\)](#)), Helmholtz Foundation Models Initiative ([Helmholtz Foundation Model Initiative - Helmholtz Home](#)), The Trillion Parameter Consortium (<https://www.anl.gov/article/new-international-consortium-formed-to-create-trustworthy-and-reliable-generative-ai-models-for>), NASA ([NASA and IBM Openly Release Geospatial AI Foundation Model for NASA Earth Observation Data | Earthdata](#)), the University of Michigan ([Scientific Foundation Models \(scifm.ai\)](#))

¹⁶⁴ Foundation models is a term defined by the Center of Research on Foundation Models of Stanford University in: "On the Opportunities and Risks of Foundation Models", <https://arxiv.org/pdf/2108.07258.pdf>

subtasks/scientific problems in the chosen domain; and 3) illustrating other possible areas of application.

The foundation models should provide researchers with access to essential AI-enabled capabilities for scientific discovery; employ the machine learning algorithms, models and architectures best suited for the chosen domain; be adaptable to different problems in the domain¹⁶⁵; and be based on a robust and reliable architecture, as any potential errors and problems would be propagated to the downstream applications.

The foundation models should be placed at the disposal of the scientific community as open models, including the source code and, where possible, training datasets and other associated assets needed for full reusability of the foundation models (unless justified otherwise). This will serve a wider scientific community, thus broadening access to such scientific infrastructure and facilitating the use and adaptation of the model to different problems. Proposers should provide a clear documentation on the use and limitations of the model, alongside case studies demonstrating the model's application to a variety of tasks/problems in the chosen domain.

Multidisciplinary research activities should involve both AI and domain scientists, and address some of the following:

- Conceptualisation and planning: the scope, objectives and expected outcomes of the foundation model;
- Suitable interfaces for domain experts without computer science background to contribute to and utilise the outcomes;
- Data identification, collection and management of (preferably diverse, multimodal) datasets through semantically annotation data schemas;
- Model development, validation, testing under relevant operational and environmental conditions (such as thermal gradients, fatigue, corrosion, etc.) and, as appropriate, model evaluation and benchmarking, for example DOME¹⁶⁶;
- Integration of domain knowledge into the model (for example through machine readable representations like RDF (Resource Description Framework)).

Proposals should:

- Prove access to high quality (multimodal) data needed for the development of the model. If in the process of developing the model, there is a need to create new data sets or adapt existing ones, they should follow the FAIR¹⁶⁷ principles. Describe the data curation and quality control procedures that will be used to ensure the accuracy, completeness, and consistency of the training data.

¹⁶⁵ An example in materials science, for inspiration only: [*2401.00096.pdf \(arxiv.org\)](https://arxiv.org/abs/2401.00096)

¹⁶⁶ <https://dome-ml.org/>

¹⁶⁷ Findable Accessible Interoperable Reusable data.

- Contribute to efforts to reach common standards for data formats, metadata, taxonomies and ontologies.
- Demonstrate a strategy¹⁶⁸ to access the computational resources needed for model training, evaluation/testing and inference.
- Propose a model architecture that is designed with transparency in mind
- Ideally, employ methodologies for integrating domain/interdisciplinary knowledge into the model and seek synergies with solutions that facilitate the managing and making sense of vast amounts of data (for example knowledge graphs).
- Identify at least four possible use cases and scientific challenges that can be addressed with the model and its adaptations.¹⁶⁹
- Identify and assess the potential risks of misuse of the foundation model.
- Propose a plan to make the model public, maintain and evolve it and promote it to the scientific community on a regular basis, in order to give visibility to the concept, discuss key findings and anticipate the technology evolution – possibly in synergy with other relevant projects.

Proposals should involve expertise in Social Sciences and Humanities (SSH), in the cases where legal and ethical experts should be involved to address data privacy, sharing agreements, and compliance with regulations.

Synergies with the selected projects from HORIZON-INFRA-2025-01-EOSC-06: Using Generative AI (GenAI4EU) for Scientific Research via EOSC are encouraged, where relevant. Proposals are encouraged to collaborate with established infrastructures such as the WeatherGenerator¹⁷⁰ project.

International cooperation is encouraged, where the EU has reciprocal benefit, like the Trillion Parameter Consortium.¹⁷¹

In this topic the integration of the gender dimension (sex and gender analysis) in research and innovation content is not a mandatory requirement.

¹⁶⁸ In case the project plans to use the EuroHPC network, the EU-funded project EPICURE offers an application support service for EuroHPC: [Epicure - European Commission \(europa.eu\)](https://epicure.eu)

¹⁶⁹ For materials science, examples include, but are not limited to: **(for materials science)** alternatives to hazardous materials like PFAS, materials that lower environmental footprint, materials for quantum technology, for higher capacity batteries, for more efficient photovoltaic devices, etc.; **(for climate science)** enhanced prediction of climate and weather extremes, early warning systems, forecasting of climate-driven migration, and monitoring of the global carbon budget, monitoring and measuring adaptation effectiveness; **(for environmental pollution sciences)** solutions for the detection and assessment of pollution, including pollutants of emerging concern; **(for agricultural sciences)** enhanced prediction of impact of plant pests, monitoring of animal health and welfare, monitoring of soil health or of water management in agriculture.

HORIZON-CL4-INDUSTRY-2025-01-DIGITAL-62: Facilitated cooperation for AI in Science (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).¹⁷².</p>

Expected Outcome: Projects are expected to contribute to the following outcomes:

- Identify the long-term research challenges where AI can make a meaningful breakthrough contributing to EU's competitive edge in selected scientific disciplines/areas, through a Strategic Research and Innovation Agenda.
- Provide evidence to structure the resources for AI in Science at European level, as a feasibility test towards potential R&I initiatives beyond the CSA that could optimise access to relevant data, infrastructure and talent across different scientific domains for more and better AI-enabled research.
- Coordinate, strengthen the network and raise awareness and a community of scientists, including citizen scientists, research organisations and stakeholders towards new paradigms of research with AI.

Scope: Artificial intelligence is a game-changer for science and innovation, and promises significant opportunities to boost the European competitive edge in R&I that need to be capitalised on. The aim of the CSA is to structure AI-enabled research in Europe and assess

¹⁷² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

options towards optimising the ecosystem for AI in Science in Europe, through a Strategic Research & Innovation Agenda and assessing the potential for possible future R&I initiative(s), in line with the recommendations of the Scientific Advice Mechanism¹⁷³, and the European Commission President's political guidelines, for the setting up of an AI Research Council¹⁷⁴..

The project should develop a Strategic Research and Innovation Agenda for AI in Science by mobilising large groups of domain and AI researchers in different fields **to identify key long-term research challenges in a diverse range of scientific areas where AI can make a meaningful difference for scientific breakthroughs**, which are compelling to the EU competitive, environmental and social policy agenda. The project should come up with pilot areas from across Horizon Europe Pillar II Clusters, building on Europe's competitive advantages in science and AI technologies. The research challenges should be related to prediction and design problems in the different scientific fields identified that could be solved with AI.

The SRIA should also include areas where AI can improve generic scientific tasks e.g virtual research assistant / tools for literature-based discovery, for improving / enabling research workflows, lab automation and collaborative human-AI work in science. Research priority areas involving the use of models based on frugal AI, which are more compact, more efficient and less energy intensive, as well as human-centric and trustworthy AI for scientific work should also be explored.

The project should build evidence and assess the needs and potential for R&I initiatives for AI in Science beyond the CSA, in an effort to identify ways to improve the EU landscape for support for AI in Science, to be discussed and **agreed upon with the Commission and the Member States**. The assessment should identify the ways for improving data access, infrastructure and support services, as well as skills and talent-related needs to boost the integration of AI in different fields of science at larger scale in Europe in research processes and lab automation, while promoting reproducibility, transparency and open science. It should also identify options for EU to better enable cooperative development and sharing of AI models for scientific discovery across different scientific fields. It should also take into account existing EU efforts to support access to data, research infrastructures, networks, HPC.

Different scenarios of R&I initiatives and infrastructure improvements should be prototyped together with a diverse range of users and stakeholders from the research community, industry, start-ups, civil society and policy-maker communities. Based on the feasibility test results, the project should **develop a roadmap** on the needed steps for a more effective coordination between the domain and AI scientific communities in Europe and the needed upgrades in service and infrastructure provision at EU level for the integration of AI in

¹⁷³ See European Commission's Group of Chief Scientific Advisors (2024). [Successful and timely uptake of artificial intelligence in science in the EU: scientific opinion](#). Brussels: European Commission.

¹⁷⁴ See [Ursula von der Leyen, Political Guidelines For The Next European Commission 2024–2029](#)

different scientific fields, including research processes engaging citizens and civil society, e.g. Citizen Science.

The proposals should also provide coordination and dissemination for interdisciplinary AI-enabled science to facilitate stakeholder engagement, coordination and promotion of AI in Science initiatives across Europe. The CSA should develop a website, organise awareness raising events for the benefits of AI in Science and create opportunities for exchanging on good practices.

Projects should build on or seek collaboration with existing projects and develop synergies with other relevant European, national or regional initiatives, funding programmes and platforms, in particular with EU-level initiatives such as EOSC¹⁷⁵, EuroHPC Joint Undertaking¹⁷⁶, ESFRI,¹⁷⁷ AI Factories,¹⁷⁸ the EU AI, Data and Robotics Partnership,¹⁷⁹ AI4EOSC¹⁸⁰ the AI on Demand Platform¹⁸¹ and the GenAI4EU Central Hub.

Destination 5: Open Strategic Autonomy in Developing, Deploying and Using Global Space-Based Infrastructure, Services, Applications and Data

Today, EU citizens enjoy watching satellite TV, increasingly accurate global navigation services for all transport modes and users, extended Earth monitoring for land, marine, atmosphere and climate change, global meteorological observation and accurate cartographies of a wide number of variables. Space also makes important contributions to security crisis management and emergency services. EU Space Programme components (such as EGNSS and Copernicus) are key assets for the EU policies on climate, environment, transport, agriculture and secure society. Finally, the Space sector is a source of economic growth and jobs.

This Destination is structured along the following building blocks:

- Accessing Space, i.e. the ability to transport satellites, cargo, and humans into space; build and launch the required vehicles, including re-usable systems; and operate the related facilities and services;
- Using Space on Earth, i.e. the ability to provide space-based secure communication, navigation and Earth observation services and applications, including through the EU Space flagships Galileo, Copernicus and IRIS²;
- Monitoring Space, i.e. the ability to detect, track and anticipate the trajectory of spacecraft, Near-Earth objects, and space debris during their full lifetime; to share data with relevant stakeholders; and to provide solutions for safe international space traffic management. It also includes the tracking and anticipation of other impacts on the space environment, such as Space weather events;
- Acting in Space, i.e. the ability to inspect, rendezvous and dock, grasp, repair, reconfigure, build, assemble and disassemble, reuse/recycle, relocate, remove and transport operational, non-operational, and other objects in space, including platforms or larger structures;
- Exploring Space, i.e. the ability to conduct high profile space exploration activities, perform excellent science and exploit space data to increase our knowledge about the Universe and celestial bodies, with a view to their exploration for scientific and socio-economic benefits;
- Boosting Space, i.e. the ability to sustain the above strategic capabilities through fostering the competitiveness of the EU space sector; improving education and developing the required skills; accelerating the pace of innovation; supporting EU non-dependency on critical technologies; and strengthening international cooperation.

Those building blocks are implemented through the following headings:

- **Heading 1: Accessing Space**

Autonomous access to space is a prerequisite for the strategic autonomy of the EU. It is a key enabler and indispensable element in the space ecosystem and value chain. European launch systems allow the autonomous deployment of satellites for the Union's flagships Copernicus, Galileo/EGNOS and IRIS² and contribute to the security and resilience of Europe's sovereign space infrastructure.

In a context of fierce competition and launch services paradigm changes, ensuring that Europe improves the resilience and the cost-effectiveness of its autonomous access to space is crucial. This requires urgent activities to enable and further consolidate operational capacities before 2030.

This challenge will be tackled by fostering space transportation solutions through the support to building blocks for smart technologies and digital solutions and contributing to facilitate access to European spaceports.

In a forward-looking approach and thanks to the implementation of a European Parliament Preparatory Action (outside the scope of Horizon Europe), a new R&I approach will be applied toward a more service-oriented and less prescriptive support of the full development cycle of access to space innovations. At the same time, a reflection will be carried out to envisage follow-up actions through the 26-27 WP and future programmes.

- **Heading 2: Acting in Space**

Act in space is a key enabler of the future freedom of action of the EU. In-Space Operations and Services (ISOS) will ensure EU's freedom of action in space and increase the resilience, sustainability, safety and protection of its space infrastructure, and contribute to the strengthening of the competitiveness of the EU space sector. R&I activities should bring the Europe to the forefront of emerging service applications, including inspection, rendezvous and docking, grasping, repair, reconfiguration, assembly and disassembly, manufacturing, resource extraction, reuse/recycling, removal and transport of objects in space, for satellites, platforms and larger structures. Key space R&I activities will be driven by a pilot mission that will contribute to establish and foster a new in-space economy.

Game-changing innovations and enabling technologies are at the heart of ISOS and an important focus of future actions. The paradigm shift towards adaptive space systems builds on automation and robotics, artificial intelligence, modular and reconfigurable spacecraft concepts. Together with other enabling technologies such as electric propulsion, they will provide new ways on how space assets are designed, produced, tested, transported, and operated. Different means realised with AppStore-like approaches will benefit the future space ecosystem and foster a circular economy.

- **Heading 3: Using Space on Earth related to telecommunications**

The Union Secure Connectivity programme aims to develop a secure and autonomous space-based connectivity system for the provision of guaranteed and resilient satellite communications on Earth. Among the objectives are to develop, build and operate a multiorbital space-based state-of-the-art connectivity system, continuously adapted to

governmental satellite communications demand evolution; to complement the Union pool of satellite communication capacities and services; and to integrate the GOVSATCOM ground segment infrastructure, as well as the European quantum communication infrastructure (EuroQCI).

- **Heading 4: Using Space on Earth related to Earth Observation**

Copernicus core services (Climate Change, Marine Environment Monitoring, Land Monitoring, Atmosphere Monitoring, Emergency Management and Security) should evolve and improve to better respond to new and emerging policy needs, and to leverage the latest science and technology developments. The Copernicus service evolution research topics will focus on further enhancing the services in the areas of coupled Earth system reanalysis and exploitation of past and emerging satellite and other data streams, soil-vegetation-atmosphere modelling for volatile organic compounds and pollen, wildfire risk forecasting and related carbon emissions, and ocean data assimilation and ensemble prediction. The digital transformation across services and value chains will be promoted via a dedicated broad topic on AI to stimulate innovation and know-how exchange. In connection with the Space Data Economy, downstream market uptake research activities will focus on energy, climate adaptation and environmental footprint reduction, green financing and insurance, and liveable cities of the future. Innovation in Earth observation services will also be supported in the field of ship source pollution detection in the context of evolving maritime policies.

- **Heading 5: Using Space on Earth related to satellite navigation**

For Galileo/EGNOS, the international context, the competitive environment with emerging actors and novel techniques in the value chain, the increasing threats, and the evolution of the technologies, components and systems, including dual-use technology, call for a constant adaptation of the EU space infrastructure to these changing realities.

To meet these challenges, EU needs sustained investments in R&D for innovative mission concepts, technology and systems. These will ensure the continuity of the EGNSS service, minimise the risks for technology inclusion in the infrastructure, thanks to anticipated development and testing including in-orbit, protect better this infrastructure against modern threats (notably cyber, jamming/spoofing, natural hazards), and increase the strategic autonomy in key technologies. Overall, they will maintain the EU's leadership position in the Global Navigation Satellite Systems.

- **Heading 6: Using Space on Earth related to services and data coming from satellites**

Over 10% of the European GDP is enabled by economical activities linked to the need of location through satellite navigation systems. Whilst the market uptake of EGNSS is already good in many areas, important priorities still remain, in particular 1) support the development of solutions that underpin EU priorities and policies, including the Green Deal, 2) support the public sector as a customer of Galileo, 3) foster the competitiveness of EU downstream

industry and SMEs/start-ups and 4) leverage synergies with other space programmes and non-space technologies.

Downstream R&I activities for EGNSS applications are needed to support the uptake of the new services/differentiators (i.e. Galileo High Accuracy Service and Open Service Navigation Message Authentication, made available in 2022 for testing and initial services, Galileo Emergency Warning Service to be made available in 2025 and Galileo Public Regulated Services to be made available soon). Opportunities to be market leader lie a.o. in autonomous driving, unmanned vehicles (aerial, terrestrial and maritime), location-based services, critical infrastructures, emergency management and humanitarian aid, insurance and finance, urban development and cultural heritage.

Regarding Copernicus applications, the digital dimension must be reinforced, encouraging the collaboration of ICT players with Earth observation and space stakeholders. The uptake of applications using Copernicus data could be improved, including by public authorities, who are important potential customers. Also, while many applications are developed for the land sector, other areas are less active. Solutions for a more sustainable use of resources and preserving biodiversity should be reinforced, as well as for countering natural hazards and climate extreme events as well as climate change mitigation and adaptation.

- **Heading 7: Monitoring Space**

Orbital space infrastructure, the data, and the services they deliver have become indispensable for European societies and economies and in the daily lives of Europeans. However, due to an increasingly congested orbital space, the likelihood of a satellite being severely damaged or destroyed in a collision has raised dramatically. Such risk calls for action to preserve European interests by protecting its private and public investments in space in a sustainable manner.

Based on the EU Space Programme, capabilities of the Space Situational Awareness (SSA) component and Space Surveillance and Tracking (SST) services are being developed and consolidated through a Partnership of 15 Member States. The EU SST Partnership Agreement has officially entered into force on 11 November 2022. With this Partnership, EU SST builds on the good results achieved by the initial consortium of 5 Member States (Decision 541/2014) and targets continuity of activities and service provision, improvement of specialisation on expertise, and consideration of the duality and security dimension of SST.

Partnership's Member States have joined forces and networked their national assets and competences with the objective to establish and improve the Union's SST capacities to ensure the delivery of SST services to European institutions, public authorities, and public and private spacecraft operators and owners. Services are structured around three axes: Collision Avoidance, Fragmentation Analysis and Re-entry Analysis. EU SST service provision is the key operational capability for the EU's future approach to Space Traffic Management (STM) which encompasses the means and the rules to access, conduct activities in, and return from outer space safely, sustainably, and securely.

EU SST relies on the European industry, including start-ups, to develop and improve national, public-owned capacities based on Partnership's requirements. As a result, more than 80% of the funds delegated by the EU to the EU SST Partnership are sub-contracted to EU industry through call for tenders. This has triggered the spawning of a European industrial sector on SST activities that should contribute to the EU STM approach. On 15 February 2022, a Joint Communication on STM (JOIN/2022/4 final) has been adopted, calling for the enhancement of EU operational capabilities to support SST and STM activities (action 2). Within the framework of this STM Joint Communication, a European Industry Start-ups Forum on Space Traffic Management (EISF) has been created. The Forum aims at directly involving EU companies and other relevant stakeholders in the conception of future research and innovation activities in the SST/STM domain.

Further resilience and autonomy of the Union's SST capabilities will come by leveraging complementary contributions from European private capabilities and commercial initiatives. At the same time, EU industry is expected to adapt and benefit from new SST market opportunities appearing in a rapidly changing environment in and beyond Europe. To that end, research and development activities are oriented towards the strengthening of the competitiveness of the Union space industry, including start-ups, by increasing its capacity in designing, building, and operating its own SST systems.

Importantly, SSA also covers the domains of Space Weather (SW) and Near-Earth Objects (NEO). For those domains, activities are ongoing and no additional ones are needed under the 2025 WP.

- **Heading 8: Boosting space through non-dependence of the EU for key critical space technologies**

Ensuring non-dependence for critical space technologies is key, especially in the current geo-political context. The European Commission has undertaken several activities and deployed new tools (e.g. the EU Observatory of Critical Technologies) for assessing space technologies and identify those that are critical from a dependency point of view. Within this domain, a number of technological developments will be initiated with focus on priorities stemming from on-going and planned EU Space missions, including IRIS². Emphasis will be on reducing non-EU dependencies on critical space technologies across their whole supply chain from advanced materials to components, equipment, and sub-systems; providing unrestricted access to advanced space technologies relevant for EU space missions and programme components; developing or regaining capacity to operate independently in space by developing resilient space technologies supply chains, relying on EU supply chains and/or trustable and reliable supply chains not affected by non-EU export restrictions; enhancing competitiveness by developing products and capabilities reaching equivalent or superior performance level than those from outside the EU and compete at worldwide level; and opening new opportunities for manufacturers by reducing dependency on export restricted technologies.

- **Heading 9: Boosting Space through international cooperation**

International cooperation remains an important enabler as global challenges can best be addressed by global solutions. Opportunities lie especially in innovative technologies, in the exploitation of space-based data and in downstream applications.

- **Heading 10: Boosting Space through training and education activities**

Preparing the skilled workforce of tomorrow is essential to bridge the gap between supply and demand for talents in the European Space sector and inspire the next generation of space professionals.

- **Heading 11: Boosting Space through IOD/IOV opportunities**

IOD/IOV opportunities continue to be needed for experiments needing aggregation as well as for read-to-fly satellites. This includes the Flight Ticket Initiative to support competitiveness and innovation of the European Space sector.

- **Heading 12: Boosting Space through support to entrepreneurship**

Business development, acceleration and upscaling of start-ups is also much needed, which has given rise to the set-up of the CASSINI Space Entrepreneurship Initiative. CASSINI provides support to business and innovation-friendly ecosystems, including the strengthening business skills in the space market segments and digital services based on space data. CASSINI also aims at making start-ups and scale-ups investment-ready and able to secure venture capital funding and at leveraging synergies with the InvestEU programme and the EU Space Programme.

Limiting participation in certain actions to Member States (and certain associated countries to Horizon Europe)

The Space research part of the Horizon Europe Programme is by default open to the world, promoting international cooperation to drive scientific excellence.

However, an important aspect of this Destination consists in ensuring security and strengthening strategic autonomy across key technologies and value chains, taking advantage of the possibilities that space offers for the security of the Union and its Member States. This objective requires special rules in specific cases to set the requisite eligibility and participation conditions to ensure the protection of the integrity, security and resilience of the Union and its Member States. Hence, on an exceptional basis and duly justified, this work programme may foresee a limited participation to entities from selected countries. Such exceptional circumstances would relate to prevalent considerations to safeguard the Union's strategic assets, interests, autonomy or security. Possibilities for such limitations are framed by Article 22(5) of the Horizon Europe Regulation.

The following call(s) in this work programme contribute to this destination:

HORIZON-CL4-2025-02-SPACE-HADEA

HORIZON-EUSPA-2026-SPACE-03

Heading 1 - Accessing Space

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-02-SPACE-11: CSA on access to European spaceports

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 1.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 1.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions, participation is limited to legal entities established in Member States, Norway, Iceland and the other Associated Countries. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the</p>

	Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁸² .
--	---

Expected Outcome: Common regulatory practices and guidelines will facilitate access to European spaceports and increase their attractiveness for European launch systems. The action is expected to contribute to the following outcomes:

- Awareness of stakeholders on practices and regulations;
- A comprehensive overview of technical challenges to be addressed in terms of guidelines and best practices;
- An assessment of the paths for the European spaceports regulations, guidelines and best practices to support safe and sustainable launch operations;
- An identification of the benefits for the European space market development, for European sovereignty as well as for international cooperation.
- Standards and guidelines should contribute to ease to launching from various spaceports.

Scope: This coordination and support action will contribute to the expected outcomes by:

- Assessing best practices, standards and guidelines for launch operations from European spaceports, taking into account experiences from worldwide existing spaceports.
- Proposing a set of common regulatory practices and guidelines for European Spaceports and evaluating their impact on the launch operations.
- Involving European stakeholders participating in the development of safety equipment with the aim to strengthen the spaceports interoperability with their technological solutions.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-12: Digital solutions for autonomy for space transportation systems, design and simulation tools - Digital enablers and building blocks

Call: SPACE-HADEA

Specific conditions

¹⁸² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions, participation is limited to legal entities established in Member States, Norway, Iceland, Canada, New Zealand, Switzerland, and the United Kingdom. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security.¹⁸³</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may</p>

¹⁸³

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

	additionally be used).
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 4-5 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁸⁴ .

Expected Outcome: The topic encompasses actions within the scope of the co-programmed European Partnership on Globally Competitive Space Systems ('Space Partnership') in the areas of satellite communication (SatCom), Earth Observation (EO) and New Commercial Space Transportation Solutions and is part of cohesive activities in the domain of digital developments under the grand heading of "digitalisation for commercial space solutions".

Under the area of *Access to Space* related to New Space Transportation Solutions, this topic focusses on the Low to Mid TRL level building blocks for key technologies required to strengthen competitiveness in this domain. Areas for launch service improvement are e.g., health monitoring systems, enabling real time subsystem monitoring through all mission phases, high speed sensor networks for on board real-time data feeds, smart avionics, functional building blocks for autonomy, enhanced ground-board high-data rate communication and high-speed on-board computer, as well as Artificial Intelligence algorithms to process high volumes of data.

Project results are expected to contribute to one or several of the following expected outcomes:

- Improved space transportation systems and launcher sustainability, reduced costs and operational constraints as well as enhanced system monitoring and autonomy;
- Technology developments for New Space Transportation Solutions, including addressing software and digital tools;
- Models for mission, system design and optimisation, able to integrate life cycle analysis, engineering and environmental models for optimisation of development through manufacturing and mission implementation.

¹⁸⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

This will contribute to developing, deploying global space-based services applications and data and contribute to fostering the EU's space sector competitiveness, as stated in the expected impact of this destination.

Scope: To tackle the above-mentioned expected outcomes, the following R&I is expected to be addressed:

- the maturation of eco-design software tools enhancing reconfigurability in orbit
- the maturation of disruptive/game changing technologies related to digitalisation

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space.

Proposals under this topic should explore synergies and be complementary to already funded actions in the context of technology development at component level. In particular, it is expected that projects make use of existing European technologies and/or building blocks at component level contributing to European non-dependence and strengthen competitiveness, and this should be clearly presented in the proposal. Furthermore, proposed activities should be complementary to H2020 and Horizon Europe funded projects, national activities and activities funded by the European Space Agency (ESA).

This topic implements the co-programmed European Partnership on ‘Globally Competitive Space Systems’ (GCSS). As such, projects resulting from this topic will be expected to report on results to the European Partnership ‘Globally Competitive Space Systems’ (GCSS) in support of the monitoring of its KPIs.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-13: Digital solutions for autonomy for space transportation systems, design and simulation tools – targeting demonstration

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 7.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 7.00 million.
<i>Type of Action</i>	Innovation Actions

<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions, participation is limited to legal entities established in Member States, Norway, Iceland, Canada, New Zealand, Switzerland, and the United Kingdom. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security.¹⁸⁵</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	<p>Activities are expected to achieve TRL 7-8 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p>

¹⁸⁵

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

	Eligible proposals submitted under this topic and exceeding all the evaluation thresholds will be awarded a STEP Seal [https://strategic-technologies.europa.eu/about/step-seal_en].
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ¹⁸⁶ .

Expected Outcome: The topic encompasses actions within the scope of the co-programmed European Partnership on Globally Competitive Space Systems ('Space Partnership') in the areas of satellite communication (SatCom), Earth Observation (EO) and New Commercial Space Transportation Solutions and is part of cohesive activities in the domain of digital developments under the grand heading of "digitalisation for commercial space solutions".

Under the area of *Access to Space* related to New Space Transportation Solutions, this topic focusses on the Mid to High TRL level developments of key technologies required to strengthen competitiveness in this domain.

Cost reduction, enhanced availability, and improved reliability must be reached by harnessing the advantages of reusability and modularity. Areas for launch service improvement are e.g., health monitoring systems, enabling real time subsystem monitoring through all mission phases, development of technologies and functional building blocks with a focus on digital solutions for autonomy, development of low cost/low mass sensors and efficient avionics. The demand for readily accessible off-the-shelf modular solutions and products, caters to the needs of all launcher manufacturers.

Project results are expected to contribute to one or several of the following expected outcomes:

- The ability to identify and locate structural damage remotely (like cracks, corrosion, delamination or structural weakening) within the transportation systems before it leads to significant failure.
- The ability to provide autonomous thermo-mechanical monitoring enabling tracking changes in temperature, mechanical behaviour and loads experienced by the transportation systems, to predict and autonomous prevent failures.

¹⁸⁶ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

This will contribute to developing, deploying global space-based services applications and data and contribute to fostering the EU's space sector competitiveness, as stated in the expected impact of this destination.

Scope: To tackle the above-mentioned expected outcomes, the following R&I should be addressed: R&I on advanced technologies and digital sensors for new space transportation, such as smart avionics with modularity and reusability drivers, health monitoring system and smart sensors, and structural health monitoring addressing thermo-mechanical monitoring and damage detection, ground and flight software for data management even by use of AI-algorithms.

The developments should aim at on-ground or in-orbit demonstration focusing on software and digital tools.

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space via e.g., on-ground or in orbit demonstration.

Proposals under this topic should explore synergies and be complementary to already funded actions in the context of technology development at component level. In particular, it is expected that projects make use of existing European technologies and/or building blocks at component level contributing to European non-dependence and strengthen competitiveness, and this should be clearly presented in the proposal. Furthermore, proposed activities should be complementary to H2020 and Horizon Europe funded projects, national activities and activities funded by the European Space Agency (ESA).

This topic implements the co-programmed European Partnership on 'Globally Competitive Space Systems' (GCSS). As such, projects resulting from this topic will be expected to report on results to the European Partnership 'Globally Competitive Space Systems' (GCSS) in support of the monitoring of its KPIs.

This topic contributes to the Strategic Technologies for Europe Platform (STEP) and addresses Space technologies falling under the sectors of "digital technologies" and "deep tech innovation". This topic addresses objectives stated in the STEP Regulation, e.g., the development of critical technologies and safeguarding and strengthening their EU value chain. This topic will help reduce strategic dependencies from outside of the EU for components and equipment for the EU Space Programme, as well as for other European space applications.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Heading 2 - Acting in Space

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-02-SPACE-21: ISOS Pilot Mission Detailed Design – Servicing component

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 6.00 and 12.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 18.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>The page limit of the application is 60 pages.</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely avoiding a situation of technological dependency on a non-EU source, in a global context that requires the EU to build on its strengths and to carefully assess and address strategic weaknesses, vulnerabilities and high-risk dependencies, participation is limited to legal entities established in Member States and the following associated countries: Norway and Iceland. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security.¹⁸⁷</p>

¹⁸⁷

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retracts or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of

	If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: Eligible proposals submitted under this topic and exceeding all the evaluation thresholds will be awarded a STEP Seal [https://strategic-technologies.europa.eu/about/step-seal_en].
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: The strategic objective of this topic is to develop capabilities to ‘Act in Space’ through demonstrating in space a pilot mission by 2030 related to ISOS. The envisaged ISOS pilot mission shall provide the necessary seed components for a future service infrastructure, available to the European in-space ecosystem (including the EU assets), driving the generation of a new in-space economy, providing enhanced in-orbit technology demonstration and maximising EU technology non-dependence.

This pilot mission will largely contribute to ensure EU’s freedom of action in space, increase the resilience and protection of EU assets in space and foster the development of the new in-space economy. A pioneering and a novel mission concept which is unique compared to other initiatives among all space-faring nations is envisaged. The mission will build on previous R&I with an operational mission concept, focusing on application and service demonstration, with a concrete view to commercial and governmental usage. The detailed mission concept will be derived in close coordination with EU Member States and EEA countries through a dedicated ISOS Pilot Mission Advisory Group (PMAG)¹⁸⁸.

the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

¹⁸⁸ The ISOS Pilot Mission Advisory Group (PMAG) is composed of representatives of the Commission and the public authorities of interested Member States and EEA countries, under the chair of the Commission, with the objective to frame the ISOS Pilot Mission. It is expected that the PMAG will be

This topic addresses the finalisation of the detailed design of the **servicing component of the ISOS pilot mission**, that should feature robotic capabilities. The servicing component will be based on previous and ongoing R&I developments and could provide services such as inspection, upgrade, repair, life extension including refuelling, delivery and exchange of payload, reconfiguration, relocation, capture and removal of assets in space.

Project results are expected to contribute to the following expected outcomes:

- A sustainable, highly automated and digitalised, flexible and economically viable space infrastructure, building on technologies and concepts for a circular economy in space, e.g. plug-and-play spacecraft functionality introducing recycling/re-use of spacecraft modules/functionalities;
- ISOS Pilot mission preparation up to detailed mission and system design for the servicing component and maturation of enabling technologies and innovative system and operational concepts;
- Elaboration of interfaces between the different components of the mission, together with the other mission components (i.e. HOST, logistics and satAPPs) and the ISOS Pilot Mission Coordination and Support Action (CSA)¹⁸⁹;
- Contribution to the ISOS Pilot Mission Objectives provided in the technical annex¹⁶³;
- Elaboration of clear use cases and relevant business models focussing on governmental and/or commercial needs;
- Ensuring the availability of results to the next mission phases.

This topic will contribute to, in the medium to long term, developing, deploying global space-based services and contribute to fostering the European space sector competitiveness, as stated in the expected impact of this destination.

Scope: To tackle the above expected outcomes, the following R&I actions should be addressed, taking into account the provided technical annex¹⁹⁰:

- R&I to complete detailed mission and system design¹⁹¹ (including relevant key technology maturation) for the servicing component as part of the ISOS pilot mission. More specifically, projects should finalise the detailed design for this component building on current or previous developments, demonstrating the achievement of the required TRL for all relevant technologies;

replaced by a dedicated expert group that will take over all functions of the PMAG; in this event all references to the PMAG will refer to that expert group.

¹⁸⁹ ISOS Pilot Mission Coordination and Support Action

¹⁹⁰ Guidance document for the ISOS Pilot Mission, derived in close collaboration with the ISOS Pilot Mission Advisory Group, and published on the EU funding and tenders portal

¹⁹¹ Comparable with a mission design phase C according to ECSS-M-ST-10C

- Contribution to the overall ISOS pilot mission detail design in close cooperation with the other mission components (including other servicing components), the ISOS Pilot Mission Coordination and Support Action and the ISOS Pilot Mission Advisory Group;
- R&I on related service capabilities and applications including operational concepts for servicing individual or fleets of satellites based on the functionality of the pilot mission system design. More specifically, possible use case for servicing a real EU asset is expected to be developed up to delivery of a concept of operations (CONOPS).

Projects are expected to ensure full compliance to the ISOS detailed pilot mission concept including interoperability with the other mission components, in case a possibility for a standalone IOD for the proposed servicing component materialises earlier than the ISOS pilot mission.

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space via e.g., on-ground or in-orbit demonstration.

Proposals should clearly present a concrete plan to ensure that required technologies reach the necessary TRL at the end of the project. Moreover, complementarities with previous and/or ongoing R&I for the proposed servicing component should be clearly described. More specifically, proposals should explore relevant and promising solutions developed in Horizon Europe, Horizon 2020, or other EU-funded relevant activities, in particular, the topics: Future Space Ecosystem (HORIZON-CL4-2021-SPACE-01-12/ 2022-SPACE-01-11/ 2023-SPACE-01-12) and in relevant projects funded by the European Space Agency (ESA) and/or national programmes. Finally, proposals are also expected to consider the use of existing European technologies and/or building blocks, including at component level, contributing to European non-dependence and strengthen competitiveness.

Proposals are expected to consider and contribute to a balanced provision of Member States' and eligible Associated Countries' expertise and capabilities to the overall ISOS pilot mission, to support a successful introduction of the strategic capacity 'Act in Space' for the EU, its Member States and other partners.

This topic contributes to the Strategic Technologies for Europe Platform (STEP¹⁹²) and addresses Space technologies falling under the sectors of “digital technologies” and “deep tech innovation”¹⁹³. This topic addresses objectives stated in the STEP Regulation, e.g., the development of critical technologies and safeguarding and strengthening their EU value chain. This topic will contribute to advancing digital capabilities in space and enhance the sustainability and agility of the EU's space assets.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

¹⁹² OJ L, 2024/795, 29.2.2024, ELI: <http://data.europa.eu/eli/reg/2024/795/oj>
¹⁹³ C(2024) 3148 final

The project(s) selected from this topic are expected to collaborate among themselves and with those selected under topics HORIZON-CL4-2025-02-SPACE-22, 23, 24 and ISOS Pilot Mission Coordination and Support Action, in order to ensure interoperability and the necessary and sufficient documentation and information sharing for the implementation of the Pilot Mission, to make economies of scale in sharing best practices, defining common processes for addressing the different challenges, ensuring efficient monitoring and review, organising dissemination and communication activities, etc. Such collaboration among all those projects will be formalised by a collaboration agreement.

HORIZON-CL4-2025-02-SPACE-22: ISOS Pilot Mission Detailed Design – HOST component

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 12.00 and 17.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 17.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	The conditions are described in General Annex A. The following exceptions apply: The page limit of the application is 60 pages.
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely avoiding a situation of technological dependency on a non-EU source, in a global context that requires the EU to build on its strengths and to carefully assess and address strategic weaknesses, vulnerabilities and high-risk dependencies, participation is limited to legal entities established in Member States and the following associated countries: Norway and Iceland. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible. For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in

	<p>the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security.¹⁹⁴</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: The strategic objective of this topic is to develop capabilities to 'Act in Space' through demonstrating in space a pilot mission by 2030 related to ISOS. The envisaged ISOS pilot mission shall provide the necessary seed components for a future service infrastructure, available to the European in-space ecosystem (including the EU assets), driving the generation of a new in-space economy, providing enhanced in-orbit technology demonstration and maximising EU technology non-dependence.

This pilot mission will largely contribute to ensure EU's freedom of action in space, increase the resilience and protection of EU assets in space and foster the development of the new in-space economy. A pioneering and a novel mission concept, which is unique compared to other initiatives among all space-faring nations is envisaged. The mission will build on previous R&I with an operational mission concept, focusing on application and service demonstration, with a concrete view to commercial and governmental usage. The detailed

¹⁹⁴

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

mission concept will be derived in close coordination with EU Member States and EEA countries through a dedicated ISOS Pilot Mission Advisory Group (PMAG)¹⁶¹.

This topic addresses the detailed design of the **platform component of the ISOS pilot mission**, which will be named **Hub for Operational Services and on-orbit Testing (HOST)**. The HOST shall be able to host multiple servicer spacecraft, IOD/V experiments and composable, and exchangeable functional satellite modules (satAPPs) for delivery, and shall be equipped with robotic manipulation and refuelling capabilities.

Project results are expected to contribute to the following expected outcomes:

- A sustainable, highly automated, flexible and economically viable space infrastructure, building on technologies and concepts for a circular economy in space, e.g. plug-and-play spacecraft functionality introducing recycling/re-use of spacecraft modules/functionalities;
- ISOS Pilot mission preparation up to detailed mission and system detail design for the HOST component, and maturation of enabling technologies and innovative system and operational concepts;
- Elaboration of interfaces between the different components of the mission, together with the other mission components (i.e. servicing, logistics and satAPPs) and the ISOS Pilot Mission Coordination and Support Action (CSA)¹⁶²;
- Contribution to the ISOS Pilot Mission Objectives provided in the technical annex¹⁶³;
- Elaboration of clear use cases and relevant business models focussing on governmental and/or commercial needs;
- Provision of enhanced opportunities for IOD/V by actively promoting experiment plug and play on the HOST;
- Ensuring the availability of results to the next mission phases.

This topic will contribute to, in the medium to long term, developing, deploying global space-based services and contribute to fostering the European space sector competitiveness, as stated in the expected impact of this destination.

Scope: To tackle the above expected outcomes, the following R&I actions should be addressed taking into account the provided technical annex¹⁶³:

- R&I to complete ISOS Pilot mission detailed mission and system design¹⁶⁴ (including relevant key technology maturation) for the platform component (HOST), demonstrating the achievement of the required TRL for all relevant technologies;

- R&I on key enabling technologies relevant for design of a scalable, modular, flexible platform component, equipped with robotic manipulation, satAPPs compatibility¹⁹⁵ and refuelling capability (for the HOST and the hosted servicer and logistic spacecraft), that can be extended and reconfigured to meet different demands (e.g., governmental and commercial, IOD/V and additional servicer hosting slots, robotic/manufacturing testbeds, warehouse and logistic node, etc.);
- Contribution to the overall ISOS pilot mission detail design in close cooperation with other mission components, the ISOS Pilot Mission Coordination and Support Action and the ISOS Pilot Mission Advisory Group;
- R&I on related HOST functions and applications including related operational concepts considering the use of distributed computing, multi-agent and network architectures and supported by simulations, enhancing the overall pilot mission system functionality.

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space via e.g., on-ground or in-orbit demonstration.

Proposals should clearly present a concrete plan to ensure that required technologies reach the necessary TRL at the end of the project. Moreover, complementarities with previous and/or ongoing R&I for the proposed servicing component must be clearly described. More specifically, proposals should explore relevant and promising solutions developed in Horizon Europe, Horizon 2020, or other EU-funded relevant activities, in particular, the topics: Future Space Ecosystem (HORIZON-CL4-2021-SPACE-01-12/ 2022-SPACE-01-11/ 2023-SPACE-01-12) and in relevant projects funded by the European Space Agency (ESA) and/or national programmes. Finally, proposals are also expected to consider the use of existing European technologies and/or building blocks, including at component level, contributing to European non-dependence and strengthen competitiveness.

Proposals are expected to consider and contribute to a balanced provision of Member States' and eligible Associated Countries' expertise and capabilities to the overall ISOS pilot mission, to support a successful introduction of the strategic capacity 'Act in Space' for the EU and its Member States.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

The project selected from this topic is expected to collaborate with those selected under topics HORIZON-CL4-2025-02-SPACE-21, 23, 24 and ISOS Pilot Mission Coordination and Support Action, in order to ensure interoperability and the necessary and sufficient documentation and information sharing for the implementation of the Pilot Mission, to make economies of scale in sharing best practices, defining common processes for addressing the

¹⁹⁵ Ability to receive functional upgrades through composable and exchangeable functional satellite modules (satAPPs) that will be connected via dedicated Universal Service Interfaces (USI)

different challenges, ensuring efficient monitoring and review, organising dissemination and communication activities, etc. Such collaboration among all those projects will be formalised by a collaboration agreement.

HORIZON-CL4-2025-02-SPACE-23: ISOS Pilot Mission Detailed Design – Logistics component

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 10.00 and 12.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 12.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>The page limit of the application is 60 pages.</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions, participation is limited to legal entities established in Member States, Norway, Iceland, Canada, New Zealand, Switzerland, and the United Kingdom. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets,</p>

	<p>interests, autonomy, or security.¹⁹⁶</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>

<i>Security Sensitive Topics</i>	Some activities resulting from this topic may involve using classified background and/or producing of security sensitive results (EUCI and SEN). Please refer to the related provisions in section B Security — EU classified and sensitive information of the General Annexes.

Expected Outcome: The strategic objective of this topic is to develop capabilities to ‘Act in Space’ through demonstrating in space a pilot mission by 2030 related to ISOS. The envisaged ISOS pilot mission shall provide the necessary seed components for a future service infrastructure, available to the European in-space ecosystem (including the EU assets), driving the generation of a new in-space economy, providing enhanced in-orbit technology demonstration and maximising EU technology non-dependence.

This pilot mission will largely contribute to ensure EU’s freedom of action in space, increase the resilience and protection of EU assets in space and foster the development of the new in-space economy. A pioneering and a novel mission concept, which is unique compared to other initiatives among all space-faring nations is envisaged. The mission will build on previous R&I with an operational mission concept, focusing on application and service demonstration, with a concrete view to commercial and governmental usage. The detailed

¹⁹⁶ The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

mission concept will be derived in close coordination with EU Member States and EEA countries through a dedicated ISOS Pilot Mission Advisory Group (PMAG)¹⁶¹.

This topic addresses the detailed design of the **logistics component of the ISOS pilot mission**. This component shall be able to transport cargo (i.e., satAPPs and propellant) taken from an upper stage to the HOST component.

Project results are expected to contribute to the following expected outcomes:

- A sustainable, highly automated, flexible and economically viable space infrastructure, building on technologies and concepts for a circular economy in space, e.g. plug-and-play spacecraft functionality introducing recycling/re-use of spacecraft modules/functionalities;
- ISOS Pilot mission preparation up to detailed mission and system design for the logistics component and maturation of enabling technologies and innovative system and operational concepts;
- Elaboration of interfaces between the different components of the mission, together with the other mission components (i.e. servicing, HOST and satAPPs) and the ISOS Pilot Mission Coordination and Support Action (CSA)¹⁶²;
- Contribution to the ISOS Pilot Mission Objectives provided in the technical annex¹⁶³;
- Elaboration of clear use cases and relevant business models focussing on governmental and/or commercial needs;
- Ensuring the availability of results to the next mission phases.

This topic will contribute to, in the medium to long term, developing, deploying global space-based services and contribute to fostering the European space sector competitiveness, as stated in the expected impact of this destination.

Scope: To tackle the above expected outcomes, the following R&I actions should be addressed, taking into account the provided technical annex¹⁶³:

- R&I to complete ISOS Pilot mission detailed mission and system design¹⁶⁴ (including relevant key technology maturation) for the logistics component, demonstrating the achievement of the required TRL for all relevant technologies;
- R&I on key enabling technologies relevant for design of a logistics component that can transport cargo (i.e., satAPPs and propellant) taken from an upper stage to the HOST component;
- R&I on solutions for docking and propellant management and transfer with the HOST. Building on existing European designs is encouraged;

- Contribution to the overall ISOS pilot mission detail design in close cooperation with other mission components, the ISOS Pilot Mission Coordination and Support Action and the ISOS Pilot Mission Advisory Group.

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space.

Proposals should clearly present a concrete plan to ensure that required technologies reach the necessary TRL at the end of the project. Moreover, complementarities with previous and/or ongoing R&I for the proposed servicing component must be clearly described. More specifically, proposals should explore relevant and promising solutions developed in Horizon Europe, Horizon 2020, or other EU-funded relevant activities, in particular, the topics: Future Space Ecosystem (HORIZON-CL4-2021-SPACE-01-12/ 2022-SPACE-01-11/ 2023-SPACE-01-12) and in relevant projects funded by the European Space Agency (ESA) and/or national programmes. Finally, proposals are also expected to consider the use of existing European technologies and/or building blocks, including at component level, contributing to European non-dependence and strengthen competitiveness.

Proposals are expected to consider and contribute to a balanced provision of Member States' and eligible Associated Countries' expertise and capabilities to the overall ISOS pilot mission, to support a successful introduction of the strategic capacity 'Act in Space' for the EU and its Member States.

This topic contributes to the Strategic Technologies for Europe Platform (STEP¹⁹⁷) and addresses Space technologies falling under the sectors of "digital technologies" and "deep tech innovation"¹⁹⁸. This topic addresses objectives stated in the STEP Regulation, e.g., the development of critical technologies and safeguarding and strengthening their EU value chain. This topic will contribute to advancing digital capabilities in space and enhance the sustainability and agility of the EU's space assets.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

The project selected from this topic is expected to collaborate with those selected under topics HORIZON-CL4-2025-02-SPACE-21, 22, 24 and ISOS Pilot Mission Coordination and Support Action, in order to ensure interoperability and the necessary and sufficient documentation and information sharing for the implementation of the Pilot Mission, to make economies of scale in sharing best practices, defining common processes for addressing the different challenges, ensuring efficient monitoring and review, organising dissemination and communication activities, etc. Such collaboration among all those projects will be formalised by a collaboration agreement.

HORIZON-CL4-2025-02-SPACE-24: ISOS Pilot Mission Detailed Design – satAPPs component

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.00 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	The conditions are described in General Annex A. The following exceptions apply: The page limit of the application is 60 pages.
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: Eligible proposals submitted under this topic and exceeding all the evaluation thresholds will be awarded a STEP Seal [https://strategic-technologies.europa.eu/about/step-seal_en].
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and

	Training Programme of the European Atomic Energy Community (2021-2025). ¹⁹⁹ .
--	--

Expected Outcome: The strategic objective of this topic is to develop capabilities to ‘Act in Space’ through demonstrating in space a pilot mission by 2030 related to ISOS. The envisaged ISOS pilot mission shall provide the necessary seed components for a future service infrastructure, available to the European in-space ecosystem (including the EU assets), driving the generation of a new in-space economy, providing enhanced in-orbit technology demonstration and maximising EU technology non-dependence.

This pilot mission will largely contribute to ensure EU’s freedom of action in space, increase the resilience and protection of EU assets in space and foster the development of the new in-space economy. A pioneering and a novel mission concept, which is unique compared to other initiatives among all space-faring nations is envisaged. The mission will build on previous R&I with an operational mission concept, focusing on application and service demonstration, with a concrete view to commercial and governmental usage. The detailed mission concept will be derived in close coordination with EU Member States and EEA countries through a dedicated ISOS Pilot Mission Advisory Group (PMAG)¹⁶¹.

This topic addresses the detailed design of the **satAPPs component of the ISOS pilot mission**, that allows the creation of composable and exchangeable functional modules for satellite upgrade and the development of a European catalogue of satAPPs, following the AppStore approach and fostering system modularisation and flexibility.

Project results are expected to contribute to the following expected outcomes:

- A sustainable, highly automated, flexible and economically viable space infrastructure, building on technologies and concepts for a circular economy in space, e.g. plug-and-play spacecraft functionality introducing recycling/re-use of spacecraft modules/functionalities;
- ISOS Pilot mission preparation up to detailed mission and system design for the satAPPs component, and maturation of enabling technologies and innovative system and operational concepts;
- Elaboration of interfaces between the different components of the mission, together with the other mission components (i.e. servicing, HOST and logistics) and the ISOS Pilot Mission Coordination and Support Action (CSA)¹⁶²;
- Enhancing opportunities for IOD/V through satAPPs by actively promoting experiment plug and play on the HOST and prepared assets;
- Contribution to the ISOS Pilot Mission Objectives provided in the technical annex¹⁶³;

¹⁹⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Elaboration of clear use cases and relevant business models focussing on governmental and/or commercial needs;
- Contributing to a European catalogue of satAPPs, following the AppStore approach and fostering system modularisation and flexibility;
- Ensuring the availability of results to the next mission phases.

This topic will contribute to, in the medium to long term, developing, deploying global space-based services and contribute to fostering the European space sector competitiveness, as stated in the expected impact of this destination.

Scope: To tackle the above expected outcomes, the following R&I actions should be addressed, taking into account the provided technical annex¹⁶³:

- R&I to complete ISOS Pilot mission detailed mission and system design¹⁶⁴ (including relevant key technology maturation) for the satAPPs component. All relevant technologies shall reach the necessary TRL.
- R&I on technologies relevant for innovative satAPPs at TRL 6 that will be used in the context of the ISOS pilot mission to demonstrate upgrade of components' functionalities and/or payload exchange and IOD/V experiments.
- R&I on satAPP modules specifically for hosting IOD/V experiments.
- Contribution to the overall ISOS pilot mission detail design in close cooperation with other mission components, the ISOS Pilot Mission Coordination and Support Action and the ISOS Pilot Mission Advisory Group.

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space via e.g., on-ground or in-orbit demonstration.

Proposals should clearly present a concrete plan to ensure that required technologies reach the necessary TRL at the end of the project. Moreover, complementarities with previous and/or ongoing R&I for the proposed servicing component must be clearly described. More specifically, proposals should explore relevant and promising solutions developed in Horizon Europe, Horizon 2020, or other EU-funded relevant activities, in particular, the topics: Future Space Ecosystem (HORIZON-CL4-2021-SPACE-01-12/ 2022-SPACE-01-11/ 2023-SPACE-01-12), EIC Accelerator WP2025 “Innovative in-space servicing, operations, robotics and technologies for resilient EU space infrastructure” and in relevant projects funded by the European Space Agency (ESA) and/or national programmes. Finally, proposals are also expected to consider the use of existing European technologies and/or building blocks, including at component level, contributing to European non-dependence and strengthen competitiveness.

International cooperation is encouraged in this topic.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

This topic contributes to the Strategic Technologies for Europe Platform (STEP) and addresses Space technologies falling under the sectors of “digital technologies” and “deep tech innovation”. This topic addresses objectives stated in the STEP Regulation, e.g., the development of critical technologies and safeguarding and strengthening their EU value chain. This topic will help reduce strategic dependencies from outside of the EU for components and equipment for the EU Space Programme, as well as for other European space applications.

The project(s) selected from this topic are expected to collaborate among themselves and with those selected under topics HORIZON-CL4-2025-02-SPACE-21, 22, 23 and ISOS Pilot Mission Coordination and Support Action, in order to ensure interoperability and the necessary and sufficient documentation and information sharing for the implementation of the Pilot Mission, to make economies of scale in sharing best practices, defining common processes for addressing the different challenges, ensuring efficient monitoring and review, organising dissemination and communication activities, etc. Such collaboration among all those projects will be formalised by a collaboration agreement.

Heading 3 - Using Space on Earth - Telecommunications

For a description of topics/actions related to the development of IRIS², please refer to "Indirectly managed actions by ESA" in the section "Other Actions" of this work programme.

Heading 3bis - Using Space on Earth – Telecommunications and Earth Observation

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-02-SPACE-31: Digital enablers and building blocks for Earth Observation and Satellite telecommunication for Space solutions

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 6.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility</i>	The conditions are described in General Annex B. The following

<i>conditions</i>	<p>exceptions apply:</p> <p>The following additional eligibility criteria apply: Subject to restrictions for the protection of European communication networks.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	<p>Activities are expected to achieve TRL 4-5 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²⁰⁰.</p>

Expected Outcome: The topic encompasses actions within the scope of the co-programmed European Partnership on Globally Competitive Space Systems ('Space Partnership') in the areas of satellite communication (SatCom), Earth Observation (EO) and New Commercial Space Transportation Solutions and is part of cohesive activities in the domain of digital developments under the grand heading of "digitalisation for commercial space solutions".

Under the area of *Using Space on Earth* related to SatCom and EO, below this topic focus on the fast increment of the Low to Mid TRL level building blocks for key technologies required to strengthen competitiveness in these domains. Digitalisation is a major enabler for enhancing the value of an End-to-End EO and SatCom system. For example, processing applied to multi-sensor data can significantly enhance the resolution of the final data set, and digital optimisation of the data flow directly improves the End-to-End timeliness of an EO system (from request to delivery). Lastly, the enhancement of End-to-End data resilience and integrity calls for digital technologies on-board and, on the ground.

Project results are expected to contribute to one or several of the following expected outcomes:

- Enable the European Space Industry to maintain a significant share of the global connectivity market by increasing the performance of space satellite networks, new type

²⁰⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

of control, space and ground segments being fully integrated into the terrestrial networks;

- New commercial services and applications enabled by increased digitalisation of space solutions;
- Advanced Earth observation payloads, technologies and processing means (on ground and/or in space), for all types of observation missions.

This will contribute to developing, deploying global, more flexible and reactive space-based services applications, to contribute to fostering the EU's space sector competitiveness, as stated in the expected impact of this destination.

Scope: The areas of R&I, which needs to be addressed to tackle the above-mentioned expected outcomes are:

- R&I on End-to-End SatCom Mission capabilities (e.g., satellite network interconnectivity, seamless integration into the terrestrial networks, taking into account and contributing to ongoing standardisation efforts, increased reactivity), strengthening efficient connectivity using various technologies (e.g. optical communication, Inter Satellite Links, reconfigurable payloads) and ensure compatibility and interoperability with 5G & 6G, and satellites as network nodes in a distributed system (e.g., ubiquitous use of orbital resources, distributed computing, embracing both ground and space), flexible and modular testbed prototype with representative building blocks for complex SatCom typologies, improve SatCom performances using innovative technologies (data fusion, user terminal development, new generation antennas, SDR payloads, exploitation of higher bands, etc).
- R&I on breakthrough harmonization enabling interoperability among multiple EO missions, breakthrough digitalized technology steps, such as AI algorithms, high performance cloud-based architectures, active and adaptive optics and/or higher power electronics (focal plane and RF back-ends and front-ends), mature (on-board and/or ground) digital techniques and technologies to support novel operational approaches, mature miniaturised instruments design - including their digitalized on-board processing electronics- fit for affordable EO constellations to address emerging markets;
- R&I on lower maturity building blocks and processes common to EO and SatCom systems, such as technologies and products improving system security and threats identification, resources usage optimization, tools to support the measure of key environmentally driven criteria through increased resource sharing, and maturation of high-performance processing payload H/W to support space network capabilities together with software functions to support reconfigurability, inter alia.

Proposals should address at least one of the areas outlined above.

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space.

Proposals under this topic should explore synergies and be complementary to already funded actions in the context of technology development at component level, while still enabling new entrants and new approaches. In particular the topics: Critical Space Technologies for European non-dependence (HE H2020 SPACE-10-TEC-2018-2020, COMPET-1-2014-2015-2016-2017, HORIZON-CL4-2021-SPACE-01-81/ 2023-SPACE-01-72/ 2024-SPACE-01-73), satellite communication technologies (H2020 COMPET-2-2016, COMPET-3-2017, SPACE-15-TEC-2018, SPACE-29-TEC-2020, HORIZON-CL4-2021-SPACE-01-11), Earth Observation end-to-end technologies (HORIZON-CL4-2022-SPACE-01-13, HORIZON-CL4-2023-SPACE-01-11). It is expected that projects make use of existing European technologies and/or building blocks, including at component level, contributing to European non-dependence and strengthen competitiveness, and this should be clearly presented in the proposal. Furthermore, proposed activities should be complementary to H2020 and Horizon Europe funded projects, national activities and activities funded by the European Space Agency (ESA).

This topic implements the co-programmed European Partnership on ‘Globally Competitive Space Systems’ (GCSS). As such, projects resulting from this topic will be expected to report on results to the European Partnership ‘Globally Competitive Space Systems’ (GCSS) in support of the monitoring of its KPIs.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-32: Preparing demonstration missions for collaborative Earth Observation and Satellite telecommunication for Space solutions

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.00 and 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 11.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: The following additional eligibility criteria apply: Subject to restrictions

	<p>for the protection of European communication networks.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 7-8 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>Eligible proposals submitted under this topic and exceeding all the evaluation thresholds will be awarded a STEP Seal [https://strategic-technologies.europa.eu/about/step-seal_en].</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²⁰¹.</p>

Expected Outcome: The topic encompasses actions within the scope of the co-programmed European Partnership on Globally Competitive Space Systems ('Space Partnership') in the areas of satellite communication (SatCom), Earth Observation (EO) and New Commercial Space Transportation Solutions and is part of cohesive activities in the domain of digital developments under the grand heading of "digitalisation for commercial space solutions".

Under the area of *Using Space on Earth* related to SatCom and EO, below this topic focusses on the Mid to High TRL level developments of key technologies required to strengthen competitiveness in these domains. Digitalisation is a major enabler for enhancing the value of an End-to-End EO and SatCom system. For example, processing applied to multi-sensor data can significantly enhance the resolution of the final data set, and digital optimisation of the data flow directly improves the End-to-End timeliness of an EO system (from request to delivery). Lastly, the enhancement of End-to-End data resilience and integrity calls for digital technologies on-board and, on the ground.

²⁰¹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Project results are expected to contribute to one or several of the following expected outcomes:

- Enable the European Space Industry to maintain a significant share of the global connectivity market by increasing the performance of space satellite networks, new type of control, space and ground segments being fully integrated into the terrestrial networks;
- New commercial services and applications enabled by an increased digitalisation of space solutions;

Advanced Earth observation payloads, technologies and processing means, for multiple spectrum and frequency bands capabilities (on ground and in space), as well as optimisation of data downlink for all types of observation missions. This will contribute to developing, deploying global, more flexible and reactive space-based services applications, to contribute to fostering the EU's space sector competitiveness, as stated in the expected impact of this destination.

Scope: The areas of R&I, which needs to be addressed to tackle the above-mentioned expected outcomes are:

- R&I on End-to-End SatCom Mission capabilities (e.g., satellite network interconnectivity, seamless integration into the terrestrial networks, taking into account and contributing to ongoing standardisation efforts, increased reactivity), strengthening efficient connectivity using various technologies (e.g. optical communication, Inter Satellite Links, reconfigurable payloads) and ensure compatibility and interoperability with 5G & 6G networks, and satellites as network nodes in a distributed system (e.g., ubiquitous use of orbital resources, distributed computing, embracing both ground and space), flexible and modular testbed for complex satcom typologies to assess performances, compatibility of the different elements and operations concepts, data fusion;
- R&I on on-board processing to optimize EO missions' performance or timeliness (e.g., standardized software framework to host embedded edge-computing applications -AI, Machine Learning, in combination with onboard image processing for multiple spectrum and frequency bands capabilities-, data/signal image processing, enhanced downlink and uplink capabilities), EO ground segment interfaces and data flow standardisation and adoption (e.g., development of use cases demonstrating the associated digital building-blocks, at least in ground relevant environment), smart multi-source EO intelligence information fusion (e.g., innovative intelligence information extraction and fusion), EO-related equipment and instruments digitalisation (e.g., miniaturization of equipment, enhancement of the European optical digital detectors supply);
- R&I on synergetic technologies, building blocks and processes with applicability across both EO and SatCom systems and missions, such as maturation of technologies and products improving system security and threats identification, resources usage

optimization, tools to support the measure of key environmentally driven criteria through increased resource sharing, and maturation of high-performance processing payload H/W and payload data flexible downlink to support space network capabilities together with software functions to demonstrate mission flexibility.

Developments should aim at on-ground relevant environment or in-orbit demonstration focusing on software and digital tools (e.g. algorithms, functions), supporting open-HW alternatives (e.g. processors, electronics) such as RISC-V or similar from design to pre-operation phases.

Proposals may contribute to one or more of the above R&I areas, however the main area addressed should be clearly and unambiguously identified. To ensure a balanced portfolio covering the three areas described above, grants will be awarded to applications not only in order of ranking but at least also to one proposal that is the highest ranked within each area, provided that the applications attain all thresholds. For the purposes of the ranking the main area declared by the proposal will be considered.

Proposals are expected to promote cooperation between different actors (industry, SMEs and research institutions) and consider opportunities to quickly turn technological innovation into commercial use in space via e.g., on-ground relevant environment or in orbit demonstration.

Proposals under this topic should explore synergies and be complementary to already funded actions in the context of technology development at component level, while still enabling new entrants and new approaches. In particular the topics: Critical Space Technologies for European non-dependence (HE H2020 SPACE-10-TEC-2018-2020, COMPET-1-2014-2015-2016-2017, HORIZON-CL4-2021-SPACE-01-81/ 2023-SPACE-01-72/ 2024-SPACE-01-73), satellite communication technologies and high speed data chain (H2020 COMPET-2-2016, COMPET-3-2017, SPACE-15-TEC-2018, SPACE-29-TEC-2020, HORIZON-CL4-2021-SPACE-01-11), Earth Observation end-to-end technologies (HORIZON-CL4-2022-SPACE-01-13, HORIZON-CL4-2023-SPACE-01-11). It is expected that projects make use of existing European technologies and/or building blocks, including at component level, contributing to European non-dependence and strengthen competitiveness, and this should be clearly presented in the proposal. Furthermore, proposed activities should be complementary to H2020 and Horizon Europe funded projects, national activities and activities funded by the European Space Agency (ESA).

This topic implements the co-programmed European Partnership on ‘Globally Competitive Space Systems’ (GCSS). As such, projects resulting from this topic will be expected to report on results to the European Partnership ‘Globally Competitive Space Systems’ (GCSS) in support of the monitoring of its KPIs.

This topic contributes to the Strategic Technologies for Europe Platform (STEP) and addresses Space technologies falling under the sectors of “digital technologies” and “deep tech innovation”. This topic addresses objectives stated in the STEP Regulation, e.g., the development of critical technologies and safeguarding and strengthening their EU value chain. This topic will help reduce strategic dependencies from outside of the EU for

components and equipment for the EU Space Programme, as well as for other European space applications.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Heading 4 - Using Space on Earth – Earth Observation

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-02-SPACE-41: Copernicus Climate Change Service (C3S) evolution: new and innovative processing and methods for future Sentinels and other satellites for reanalyses

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 10.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 10.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5-6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of</i>	The rules are described in General Annex G. The following exceptions apply:

<i>the Grant Agreements</i>	Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ²⁰² .
-----------------------------	---

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Innovative methods to prepare and pre-process observational input for Earth-system reanalysis datasets, including the Copernicus Sentinel missions, which will lead to an increase in the use of observations for Earth-system reanalysis;
- Enhanced sparse data assimilation and initialisation methods of climate sub-component (e.g., atmosphere, ocean, land, hydrology) in Copernicus products;
- Comprehensive and better information about the climate records to be extracted from the available observations improving our overall monitoring of the climate and climate change;
- Expanded range of reanalyses products towards centennial reanalyses, and enhanced climate counterfactuals data sets to support data-driven predictions and the ongoing operationalisation of extreme event attribution.

Scope: The areas of R&I to address the above expected outcomes include:

- Improve the ability of Copernicus' and other models to assimilate new and other satellite observations (e.g. the Copernicus Sentinel Expansion and Next Generation missions, contributing missions, meteorological satellites, research satellites) that are sensitive to surface parameters and fluxes. It is also necessary to undertake research on information content of early satellite data and unlock their exploitation in reanalyses at global and regional scales;
- Exploit innovative methods (including AI/ML) for data rescue for in situ and remote sensing observations, in particular regarding past and changing observing methods and environmental factors, and on error analysis, quality control and bias adjustment of the historical observation record. The aim is to make best possible use of early observations from various records of in situ and remote sensing observations to improve physically consistent analyses of the atmosphere, the ocean, the land and the cryosphere towards centennial timescales;

²⁰² This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Improve the use of Sentinel and other data in all Copernicus reanalyses and their use across different services. Beyond processing and reprocessing activities, specific coordinated developments in terms of observation operators and observational error characterization will be required;
- Explore innovative methods (e.g. AI/ML) to accelerate the production and updates of reanalyses, to capture reanalyses uncertainties efficiently, and to reduce overall computing energy/carbon footprint.

The C3S reanalyses represent a significant portion of the service data requests and are at the heart of the service product line and further exploitation (e.g. initialising climate predictions, evaluation of climate historical projections, climate intelligence, development of climate applications, AI/ML weather forecasts). The preparation of the future C3S coupled Earth system reanalyses is underway to significantly improve the consistency across earth system components and lengthen the timespan. An extension of the reanalyses back to the early 1900' would meet many requirements of users but such a task would be impossible without an adequate investment in data rescue and in the reprocessing of EO data. Reanalyses play a key and vital role in climate monitoring and in the attribution of extreme events, but the development of the required counterfactual dataset is often ad-hoc and lacks operational implementation.

Bringing together European expertise on a wide variety of observations, climate data records and global and regional reanalyses will be paramount, and this will require a very tight collaboration with space agencies, the National Meteorological and Hydrological Services, and the World Meteorological Organisation (WMO). International cooperation is hence strongly encouraged in this topic. This will fully realise the progressive exploitation of Copernicus Sentinel and other data for the monitoring of a changing climate over Europe and worldwide. In addition, the proposal should include some demonstrations of downstream applications that would benefit from these improvements. Synergies with Destination Earth are also encouraged.

Additionally, the transfer of research results to operations should receive active attention during the project to strengthen the readiness for an operational deployment in the future. Appropriate involvement and/or interaction with the relevant Entrusted Entities of the Copernicus services, the conditions for making available, for re-using and exploiting the results (including IPR) by the said entities should be addressed during the project implementation. Software should be open licensed.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-42: Copernicus Atmosphere Monitoring Service (CAMS) evolution: improved soil-vegetation-atmosphere modelling and data assimilation of atmospheric constituents

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5-6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²⁰³.</p>

²⁰³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Accurate simulation of the biogenic fluxes of Volatile Organic Compounds (VOCs) and other atmospheric constituents to represent the corresponding processes in numerical models;
- Enhanced monitoring of environmental policies regarding eutrophication and acidification of soils and ecosystems as well as for regulatory reporting commitments;
- Improved management of soils and vegetation with view to reduce health impacts from pollen and VOCs.

Scope: The areas of R&I to address the above expected outcomes include:

- Advancing soil-vegetation-atmosphere surface/interface and evapo-transpiration parameterizations, numerical models and data assimilation techniques;
- Further development of surface (sub-)models that can account accurately and dynamically for the sources and sinks of key trace gases and aerosols and are compatible with operational implementation in CAMS global and regional systems;
- Improvement of methodologies to estimate deposition fluxes and associated uncertainties;
- Develop data assimilation approaches to deliver highly resolved deposition products, based on in-situ deposition networks and Earth Observation;
- Development of accurate pollen source models for additional species among the most allergenic ones in Europe (the current pollens in the CAMS portfolio are alder, birch, olive, grass, mugwort, and ragweed);
- Investigation of modelling of pollen at the global scale;
- Development of further use of satellite observations for improving calculation of dry deposition fluxes and emissions.

Eutrophication and acidifications of ecosystems remain among the most sensitive environmental issues which drive the revision of emission reduction strategies (UNECE Gothenburg Protocol, NEC Directive). Pollen and many atmospheric trace components such as VOCs represent major public health issues, affecting hundreds of millions of people globally and in Europe. Elaborated soil-vegetation-atmosphere surface/interface models and associated parameterization are needed to represent emissions, concentrations and deposition of such constituents. Enhanced numerical models, data assimilation and parameterization techniques are needed to characterize the fate of such constituents.

The proposal is expected to develop activities that will improve and expand the operational global and regional atmospheric composition analyses, forecasts, and reanalyses. In addition, the proposal should include some demonstrations of downstream applications that would benefit from these improvements. Synergies with Destination Earth are encouraged.

The main output of the project should be tools and methodologies that can be readily transferred to the CAMS operational global and regional systems. Coordination with CLMS is also encouraged.

The transfer of research results to operations should receive active attention during the project to strengthen the readiness for an operational deployment in the future. Appropriate involvement and/or interaction with the relevant Entrusted Entities of the Copernicus services, the conditions for making available, for re-using and exploiting the results (including IPR) by the said entities must be addressed during the project implementation. Particular attention should be paid to the potential use and complementarities with the products already developed in the other Copernicus services. Strengthening Copernicus services collaboration could be foreseen. Software should be open licensed.

Proposals are encouraged to build on or collaborate with related EU funded projects like SYLVA (biogenic aerosol) or CERTAINTY and CleanCloud on modelling.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-43: Copernicus Anthropogenic CO₂ Emissions Monitoring & Verification Support (CO2MVS) capacity: new and innovative methods to estimate the impact of fires on vegetation and related carbon fluxes

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may</p>

	<p>additionally be used).</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	<p>Activities are expected to achieve TRL 5-6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²⁰⁴.</p>

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Enable accounting for the interaction between droughts, fires and vegetation in the CO2MVS capacity;
- Improve the estimation of fire emissions in the Copernicus Atmosphere Monitoring Service (CAMS);
- Improve the fire risk forecasting in the Copernicus Emergency Management Service (CEMS);
- Improve the assimilation of Copernicus Land Monitoring Service (CLMS) products in vegetation fire impact and carbon fluxes assessments.

Scope: The areas of R&I to address the above expected outcomes include:

- Better understand and characterise the impact of wildfires on the carbon cycle and on anthropogenic emissions through land use change. This has been recognized especially in the climate community when developing process-based vegetation models for use in climate models. While a large variety of empirical or process-based vegetation models

²⁰⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

exist today, it is still unclear which type of model or degree of complexity is required to model fire adequately at regional to global scales. International collaborations, such as the Fire Model Intercomparison Project (FireMIP), have evaluated existing global fire models against benchmark data sets for present-day and historical conditions;

- Investigate the current state of fire modelling and specifically how the interaction between droughts, fires and vegetation can be accounted for in a global monitoring system, such as the CO2MVS. Because of the monitoring aspects of the CO2MVS, use should be made, where possible, of including observation-based data sets representing certain aspects of the fire-vegetation interaction;
- Investigate how a better understanding of the impact of fires on vegetation can improve the estimates of fire emissions of chemical species and aerosols, and subsequently air quality products in CAMS and the fire risk forecasting in CEMS.

Wildfires have become widespread during summer over many regions of the world, including Europe, and have major safety and larger societal impacts (air quality and health, aviation, weather, agriculture, etc). Wildfires and biomass burning are significant sources of CO₂ and air pollutants in the atmosphere. Fires also change the vegetation and therefore affect the exchange of CO₂ between the biosphere and the atmosphere. Current vegetation and fire models need to be improved to refine the quality of CAMS products (air quality, emissions), the Global Fire Assimilation System (GFAS) supporting CEMS and forcing data sets for climate projections supporting the IPCC. Innovative methodologies should be investigated to include fire-vegetation interactions, also taking into account the impact of drought conditions in global monitoring systems such as the CO2MVS capacity, via the improvement of currently used process-based vegetation models or through empirical models. The use of relevant observation-based data sets (e.g. vegetation states, drought conditions, burnt areas) should be a key element of these methodologies. Current CLMS products should be considered, including options for potential improved specifications. The proposal should include some demonstrations of downstream applications that would benefit from these improvements.

The transfer of research results to operations should receive active attention during the project to strengthen the readiness for an operational deployment in the future. Appropriate involvement and/or interaction with, and/or coordination across the relevant Entrusted Entities of the Copernicus services, the conditions for making available, for re-using and exploiting the results (including IPR) by the said entities must be addressed during the project implementation. Software should be open licensed.

The possible participation of the JRC may consist in (1) ensuring access to relevant models, tools and datasets of the operational CEMS, (2) providing a good understanding of existing operational workflows for CEMS and advice regarding the operational feasibility of new developments and (3) testing of new developments/prototypes for CEMS in a pre-operational setting.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-44: Copernicus Marine Environment Monitoring Service (CMEMS) evolution: new and innovative ocean data assimilation techniques

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5-6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the</p>

	Research and Training Programme of the European Atomic Energy Community (2021-2025). ²⁰⁵ .
--	---

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- To improve ocean monitoring and predictions, and to remain at the forefront at the international level;
- To ensure CMEMS users take full advantage from advances in observations, reanalysis, analysis and forecasting systems;
- To strengthen data assimilation development exchanges between operational centres and to facilitate scientific community contributions.

Scope: The areas of R&I to address the above expected outcomes include:

- Coupled data assimilation (e.g. between ocean and biogeochemistry, ocean and sea-ice, ocean and waves and atmosphere) to control in a more consistent way the ocean state variables across ocean components or forcings and to get more benefits from observations;
- Development of multi-scale methods capable of assimilating high-resolution and high-frequency observations as well as of constraining larger scales;
- Development of methods to produce reliable estimation of analysis and forecast uncertainties;
- Use of Artificial Intelligence techniques in data assimilation schemes (e.g. use of emulators for ensemble generation, model error estimation, bias correction, separation of scale and model parameter estimation);
- Use of new types of observations (e.g. new Sentinel Expansion and Next Generation missions, new in-situ observations) or higher-resolution of existing data streams;
- Development of methods and tools to systematically assess the observing system impact in data assimilation systems (e.g. analysis and forecast sensitivity to observation);
- The development of software infrastructure that can accommodate different assimilation methods (including artificial intelligence techniques), and facilitate the sharing of algorithms and optimization of computer codes (assimilation schemes) on high-performance computers;

²⁰⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- The development of validation and intercomparison protocols to estimate and quantify the benefits of improved assimilation methods and integration of new observations (e.g. data challenges, use of OSSEs).

The development of new types of observations from satellites and in-situ and the improvement of space/time sampling of existing observations require a step change in data assimilation techniques to fully benefit from these new sources of data. Current techniques are facing hard limits to progress and need new approaches to make the best use of observation and advances in modelling (e.g. resolution). Emerging coupling, multi-scale, ensemble and artificial intelligence techniques represent new opportunities for significant improvements in ocean data assimilation. The proposal should include some demonstrations of downstream applications that would benefit from these improvements.

The transfer of research results to operations should receive active attention during the project to strengthen the readiness for an operational deployment in the future. Appropriate involvement and/or interaction with the relevant Entrusted Entities of the Copernicus services, the conditions for making available, for re-using and exploiting the results (including IPR) by the said entities must be addressed during the project implementation. Software should be open licensed.

Potential contributions to the European Digital Twin Ocean and the GEO Blue Planet initiative should also receive attention during the project, given that the CMEMS is and should remain an important player in these initiatives. International cooperation is hence encouraged in this topic.

Actions are encouraged to build on or cooperate with previous or ongoing Horizon funded projects contributing to different components of the global ocean observing value chain, for example - but not limited to - LandSeaLot, EPOC, EERIE, ObsSea4Clim, etc.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-45: Supporting the AI/ML digital transition of Copernicus Services

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 12.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 12.00 million.

<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply: Subject to restrictions for the protection of European communication networks.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5-6 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²⁰⁶.</p>

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Integrated AI/ML strategy across Copernicus Services, value chains and workflows;
- Improved quality, timeliness, reliability and resilience of Copernicus data, products and applications;
- Improved time-to-solution and energy-to-solution of Copernicus operational workflows;

²⁰⁶ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Transformed user experience through enhanced interactivity and on-demand capabilities for Copernicus services;
- Exchange of knowledge, benchmarking and best practices on using AI/ML in the context of Copernicus;
- Enhanced AI-readiness of Copernicus data, in particular open and free high-value labelled Copernicus data sets.

Scope: The areas of R&I to address the above expected outcomes include:

- AI-supported retrieval algorithms on both passive and active sensing for existing and upcoming Copernicus missions;
- Fast, reliable, consistent, and as much as possible sensor agnostic identification of clouds and shadows in optical sensing;
- Multi-source multi-target AI models for automatic segmentation;
- Physics parameterization and parameter optimization to emulate poorly understood processes and increase the fidelity of numerical models;
- Fault and outlier detection in production and delivery workflows to ensure more robust services;
- Support to automated pre-processing and QA/QC of observations and data to reduce the risk of man-made errors and product deficiencies;
- Data fusion techniques towards added-value products;
- Data compression and mining methods to navigate big data efficiently, as the amount of data is becoming a limiting factor;
- Hybrid observation operator, ensemble data assimilation techniques, error calibration and uncertainty quantification towards improved (re-)analysis and forecast skill;
- Analysis-driven Earth system deep learning models to boost prediction skill and timeliness, including with Digital Twin Earth models. These methods have shown great promises when applied to reanalyses for example;
- Experimenting observation(-only)-driven forecasting to support time-critical service elements, circumventing analysis steps. These approaches could be particularly suited for observation-dense areas from which processes can be inferred from observations alone;
- Exploring the potential of large pre-trained foundation models and transfer learning at scale for Earth system modelling, including with publicly available training datasets from Copernicus;

- Downscaling and super resolution applications building on Copernicus data to refine products in space and time;
- Adaptive workflow optimizations;
- Enhanced interactive interfaces enabling on-demand product and service generation;
- Chatbots that can guide the user across a wide range of information sources within and across Copernicus services for enhanced user support and experience.

Proposals are expected to address as many of the above areas as possible.

During the last decade, artificial intelligence (AI), machine learning, big data volumes and computing capacities have developed at an unprecedented pace, and it is now evident that Copernicus needs to become even more proactive on the digital transition. AI and machine learning offer great opportunities across the Copernicus value chain and workflows to deeply transform its data, products, applications, services and user experience.

However, the scope and speed of developments also generate challenges, in particular regarding the necessary know-how that needs to be established, the software and hardware infrastructure that need to be developed, and the integration of machine learning and conventional tools within production workflows. These challenges need to be addressed within a comparably short period of time to keep up with evolving user requirements and to leverage emerging AI/ML developments. The project is expected to foster game changer and disruptive approaches in particular towards next generation Earth system (re-)analysis and prediction systems as well as foundation models, to promote integrated AI/ML strategies and intensive cooperation and knowledge transfer with and across Entrusted Entities to pave the way into the future of Copernicus. Given the QA/QC requirements on Copernicus products, explainable, trustworthy, open-source and responsible use of AI approaches are of particular interest, as AI mainly operates as a black box. In the context of recent EU policies, a robust framework is required to ensure the same stringent quality, reliability, and verifiability requirements of AI-generated products, as well as transparency and clearly labelled information to users. Benchmarking approaches to quantify the positive impact and improvements of AI/ML methods over time are particularly encouraged.

Collaboration with the EuroGEO initiative and the project(s) funded from the topic HORIZON-CL6-2025-03-GOVERNANCE-09: Delivering Earth Intelligence to accelerate the green and digital transition is encouraged.

The transfer of research results to operations should receive active attention during the project to strengthen the readiness for an operational deployment in the future. Appropriate involvement and/or interaction with the relevant Entrusted Entities of the Copernicus services and Destination Earth, the conditions for making available, for re-using and exploiting the results (including IPR) by the said entities must be addressed during the project implementation.

The possible participation of the JRC may consist in (1) ensuring access to relevant models, tools and datasets of the operational CEMS and CLMS, (2) providing a good understanding of existing operational workflows for CEMS/CLMS and advice regarding the operational feasibility of new developments and (3) testing of new developments/prototypes for CEMS/CLMS in a pre-operational setting.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

HORIZON-CL4-2025-02-SPACE-46: Innovative Earth observation services in support of maritime litter detection and ship source pollution policies

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply: Subject to restrictions for the protection of European communication networks.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p> <p>The Joint Research Centre (JRC) may participate as member of the consortium selected for funding.</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 7-8 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and</i>	The rules are described in General Annex G. The following exceptions

<i>financial set-up of the Grant Agreements</i>	apply: Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025). ²⁰⁷ .
---	---

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- National maritime authorities and enforcement bodies will benefit from improved detection services to fulfil the requirements of the Ship Sourced Pollution Directive (SSPD), ultimately resulting in a higher environmental protection of sea waters and preservation of marine ecosystems;
- Increased accuracy from the developed solutions will allow more efficient and quick responses to potential spill incidents.

Scope: The project should address the following points:

- Development and demonstration of space sensors, including the assessment of their operational boundaries and associated technical confidence levels, for the following use cases:
 - o Estimation of oil spill volume and thickness, in conjunction with the identification of oil types using for instance oil spectral signatures;
 - o Detection of oil spills in sea ice conditions;
 - o Detection and identification of chemical products on the sea surface (MARPOL Annex II);
 - o Detection and identification of sewage on the sea surface (MARPOL Annex IV);
 - o Detection and identification of garbage on the sea surface (MARPOL Annex V);
 - o Detection and identification of exhaust gas cleaning system residue, and monitoring of single-vessel methane emissions (MARPOL Annex VI);
 - o Detection and identification of the possible polluter using vessel unique spectral signature;

²⁰⁷ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Design and improvement of use artificial intelligence methods for the identification of spills, sewage and garbage on the sea surface and their characteristics to achieve a higher level of timeliness, automation and confidence (e.g. avoid false alerts).

Context:

The MARPOL convention adopted at the IMO level regulates the release at sea of substances originating from ships, be it from the ship's operation or cargo operations. The Ship Source Pollution Directive adopted in 2005 seeks to strengthen the enforcement in the EU of the prohibition of release at sea of substances under Annex I and II of the MARPOL convention. Currently, high-resolution satellite imagery of the ocean surface is used to monitor and detect potential spill, notably through the CleanSeaNet service, offered by the European Maritime Safety Agency.

The revision of the Directive will expand its scope to discharges in the water under all MARPOL annexes. Further research is needed to adapt the current monitoring systems to the accurate detection of the substances included under the revised scope of the SSPD as the technologies may not be available or accurate enough.

The objective of this topic is to support R&I activities developing advanced technological solutions, that will allow to enhance the service provided to Member States for the detection of potential spills and identification of potential polluters.

R&I activities should complement what is currently being done by EMSA, along CleanSeaNet and the Copernicus maritime surveillance service. Moreover, the Copernicus Security Services Strategic Research Agenda (CSS-SRA) provides, on a yearly basis, an overview of R&D activities, as well as proposed actions based on latest developments. Applicants are invited to consult the corresponding additional requirements and information based on the CSS-SRA²⁰⁸ and subsequent updates when they become available to develop their proposal.

The transfer of research results to operations should receive active attention during the project to strengthen the readiness for an operational deployment in the future. Appropriate involvement and/or interaction with EMSA, the conditions for making available, for re-using and exploiting the results (including IPR) by the said entities must be addressed during the project implementation. Proposals are encouraged to connect with and contribute to both the EU Mission Restore our Ocean and Waters and the UN Decade of Ocean Science for Sustainable Development 2021-2030.

208 [JRC Publications Repository - The Strategic Research Agenda for Copernicus Security Service 2023](https://publications.europa.eu/en/publication-detail/-/publication/00000000-0000-0000-0000-000000000000)
(europa.eu)

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Heading 5 - Using Space on Earth – Satellite navigation

For a description of topics related to the development of Galileo and EGNOS, please refer to “Public Procurement” and to “Indirectly managed actions by ESA” in the section “Other Actions” of this work programme.

Heading 6 - Using Space on Earth – Services & Data coming from satellites, both Earth Observation and navigation

For a description of topics related to the development of applications for Galileo, EGNOS and Copernicus, please refer to “Indirectly managed actions by EUSPA” in the section “Other Actions” of this work programme.

Heading 7 - Monitoring Space

For a description of topics related to SSA-SST, please refer to “Identified beneficiaries” in the section “Other Actions” of this work programme.

Heading 8 – Boosting Space through non-dependence of the EU for key critical space technologies

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-02-SPACE-71: Space Critical EEE Components for EU non-dependence – RISC-V Microprocessor on 7nm

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.50 and 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	The conditions are described in General Annex A. The following exceptions apply: The page limit of the application is 80 pages.
<i>Eligibility</i>	The conditions are described in General Annex B. The following

<i>conditions</i>	<p>exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely avoiding a situation of technological dependency on a non-EU source, in a global context that requires the EU to build on its strengths and to carefully assess and address strategic weaknesses, vulnerabilities and high-risk dependencies, participation is limited to legal entities established in Member States and the following associated countries: Norway and Iceland. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.²⁰⁹</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	<p>Activities are expected to achieve TRL 5 by the end of the project. Activities may start at TRL 3. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.</p>
<i>Evaluation and</i>	<p>The evaluation committee will be composed partially by representatives</p>

²⁰⁹

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

<i>award procedure</i>	of EU institutions.
------------------------	---------------------

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Reinforcing EU strategic autonomy by reducing non-EU dependencies on critical space EEE components and related technologies across their entire supply chain;
- Providing unrestricted access to critical space EEE components and related technologies relevant for EU space missions;
- Developing or regaining capacity to operate independently in space by developing resilient space EEE components and related technologies supply chains, relying on EU supply chains and/or trustable and reliable supply chains not affected by non-EU export restrictions;
- Enhancing competitiveness by developing products and capabilities reaching equivalent or superior performance level than those from outside the EU and compete at worldwide level;
- Opening new opportunities for manufacturers by reducing dependency on non-EU export restricted technologies.

Scope: Unrestricted access to state-of-art space EEE components and related technologies is a pre-requisite for the EU space industry responding to EU space missions. However, especially for some families of components, the available solutions in EU do not meet the current high-performance space requirements. Currently, alternative products sourced from outside EU, are either affected by non-EU export control, that limits its use, or present challenges in terms of trustable supply chains for the implementation of EU space missions with a security dimension.

Within the frame of this topic, it is expected to finance and implement development projects aiming at maturing critical space EEE components with the final goal of lowering the dependency from outside EU. This will be done by establishing a long-term sustainable supply chain for supporting EU strategic autonomy in the space sector. The selection of the supply chains shall reflect this objective. Therefore, the supply chain shall preferably be built fully based in EU and when this can only be achieved partially (i.e. because of lack of current EU capabilities for unrestricted advanced semiconductor processes or advanced materials that cannot be developed within the project), services procured from outside EU shall nevertheless ensure that the overall supply chain will remain trustable and not affected by non-EU export control. The latest scenario is subject to the approval of the granting authority.

Below, the space EEE component and related technologies relevant for this Call. It has been identified based on needs related to strategic institutional space programs, inputs from European stakeholders and the EU Observatory of Critical Technologies.

- RISC-V microprocessors on 7nm technology node [Target final TRL 5]

Additional, context information and technical requirements are provided in the Technical Requirements Guidance document published on the Funding & Tenders Portal. Space is a low volume market affected by a dynamic industrial landscape compared to the terrestrial market therefore, technological spin in and/or bilateral collaborations should be enhanced between European non-space and space industries. Furthermore, proposed activities should be complementary to relevant national or other activities at European level. Complementary activities should be clearly identified, described and the proposal should report how the complementarity is ensured.

To achieve the non-dependence objective, applicants are expected to include a dedicated proposal's paragraph covering:

- The description of the technology and/or technology processes and high-level breakdown of the space EEE component supply chain to be used. Applicants should demonstrate that the supply chain and final product are free of any legal export restrictions or limitations, such as those established in the International Traffic in Arms Regulations (ITAR) or equivalent instruments applicable in other non-EU jurisdictions. Applicants shall also report, in a dedicated subsection, if and which part of the supply chain is affected by non-EU export controls such as the Export Administration regulation (EAR) i.e. EAR99.
- The description of the suitable technology development process that has been identified and set up within the consortium for avoiding export restrictions of non-EU states and assess vulnerabilities of the supply chain.

Proposal covering space EEE components and related technology developments that are targeting a final TRL equal or higher than 5, shall include a list of proposed applicable standards (e.g. EN, ECSS, ESCC, MIL, JEDEC,...) that are considered relevant for implementing a formal space evaluation and/or qualification. Additionally, projects that aim at a formal space qualification shall deliver the full data pack planned to be submitted to the qualification authority. This deliverable shall be marked sensitive and it shall be shared with the granting authority (i.e. DG-DEFIS and HaDEA). Products that will successfully complete the space evaluation/qualification, either within the EU-COM activity or as a consecutive follow up, shall inform DG-DEFIS and engrave on the package the EU flag.

The proposal must include specific tasks as part of the work plan and related dedicated confidential deliverables to be provided within 6 months from the start of the project to the relevant Commission DG and Executive Agency (i.e. DG-DEFIS and HaDEA), with the objective of:

1. Analysing and describing, **in detail**, the full supply chain, each entity and its role in the supply chain, level of criticality and, if relevant, identify dependencies from outside EU;
2. Describing the industrial technical roadmap and a business plan for commercialization with accurate understanding of applications needs, space mission insertion, including time to market indication, of the developed product.

3. Reporting the list of relevant non-EU export control with extra territorial applicability for the specific technology/product under development, independently from the supply chain established for the EU-COM project.
4. Undertaking a comprehensive literature review of the relevant technology/product reporting the state-of-the-art and highlighting potential gaps between current EU solutions and competition from outside EU.

Unless otherwise agreed with the granting authority before the grant agreement, beneficiaries must ensure that none of the entities that participate as affiliated entities, associated partners or subcontractors are established in countries which are not eligible countries or target countries set out in the call conditions.

It is recalled to the applicants that all provisions reported by the Model Grant Agreements, related to topics with restricted eligibility conditions, are applied. For example, under this light, the consortiums shall ensure that for a period up to 4 years after the end of the action, supply and availability of the products and/or processes developed and/or qualified within the project (consortium as whole or individual beneficiaries) shall be given to any entity in EU, at fair and reasonable market prices, conditions and with no legal restrictions and limitations stemming for example from International Traffic in Arms Regulations (ITAR), or equivalent instruments applicable in non-EU jurisdictions. Additionally, beneficiaries that intend to transfer ownership or grant an exclusive licence must formally notify the granting authority (i.e. DG-DEFIS and HaDEA) before the intended transfer or licensing takes place and the granting authority may up to four years after the end of the action object to a transfer of ownership or the exclusive licensing of results.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content is not relevant.

HORIZON-CL4-2025-02-SPACE-72: Space Critical Equipment and Related Technologies for EU non-dependence – Chip Scale Atomic Clocks and Solar Cells

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 3.50 and 4.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 8.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	The conditions are described in General Annex A. The following exceptions apply:

	The page limit of the application is 80 pages.
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely avoiding a situation of technological dependency on a non-EU source, in a global context that requires the EU to build on its strengths and to carefully assess and address strategic weaknesses, vulnerabilities and high-risk dependencies, participation is limited to legal entities established in Member States and the following associated countries: Norway and Iceland. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.²¹⁰</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	<p>Activities are expected to achieve TRL 5-6 by the end of the project.</p> <p>Activities may start at TRL 3. The reference TRL definition is the ISO</p>

²¹⁰

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

	16290:2013 applicable to the space sector.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio covering all the development areas described in the scope section, grants will be awarded to applications not only in order of ranking but at least also to one proposal that is the highest ranked within each development area, provided that the applications attain all thresholds</p>

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Reinforcing EU strategic autonomy by reducing non-EU dependencies on critical space equipment and related technologies across their entire supply chain;
- Providing unrestricted access to critical space equipment and related technologies relevant for EU space missions;
- Developing or regaining capacity to operate independently in space by developing resilient critical space equipment and related technologies supply chains, relying on EU supply chains and/or trustable and reliable supply chains not affected by non-EU export restrictions;
- Enhancing competitiveness by developing products and capabilities reaching equivalent or superior performance level than those from outside the EU and compete at worldwide level;
- Opening new opportunities for manufacturers by reducing dependency on non-EU export restricted technologies.

Scope: Unrestricted access to state-of-art space equipment and related technologies is a pre-requisite for the EU space industry responding to EU space missions. However, especially for some families of equipment, the available solutions in EU do not meet the current high-performance space requirements and alternative products, sourced from outside EU, are either affected by non-EU export control with extra territorial applicability, that limit the access, re-export or raise challenges in terms of trustable supply chains for the implementation of EU space missions with a security dimension.

Within the frame of this topic it is expected to finance and implement development projects aiming at maturing critical space equipment with the final goal of lowering the dependency from outside EU, establish a long-term sustainable supply chain and support EU strategic autonomy in the space sector. The selection of the supply chains shall reflect this objective. Therefore, the supply chain shall preferably be built fully based in EU and when this can only be achieved partially (i.e. because of lack of current EU capabilities that cannot be developed within the project), services procured from outside EU shall nevertheless ensure that the

overall supply chain will remain trustable and not affected by non-EU export control. The latest scenario is subject to the approval of the granting authority.

Below, the list of space equipment and related technologies relevant for this Call. It has been identified based on needs related to strategic institutional programs, inputs from relevant European stakeholders and the EU Observatory of Critical Technologies.

- Chip Scale Atomic Clocks [Target final TRL 6]
- Solar Cells [Target final TRL 5-6]

Additional, context information and technical requirements are provided in the Technical Requirements Guidance document published on the Funding & Tenders Portal outlining all relevant information for each of the above-mentioned development lines.

A proposal should address only one technology area and clearly identify the area being addressed.

Space is a low volume market affected by a dynamic industrial landscape compared to the terrestrial market therefore, technological spin in and/or bilateral collaborations should be enhanced between European non-space and space industries. Furthermore, proposed activities should be complementary to relevant national and/or other activities at European level. Complementary activities should be clearly identified, described and the proposal should report how the complementarity is ensured.

To achieve the non-dependence objective, applicants must include a dedicated proposal's paragraph covering:

- The description of the technology and high-level breakdown of the space equipment supply chain to be used. Applicants should demonstrate that the supply chain and final product are free of any legal export restrictions or limitations, such as those established in the International Traffic in Arms Regulations (ITAR) or equivalent instruments applicable in other non-EU jurisdictions. Applicants shall also report, in a dedicated subsection, if and which part of the supply chain is affected by non-EU export controls such as the Export Administration regulation (EAR).
- The description of the suitable technology development process that has been identified and set up within the consortium for avoiding export restrictions of non-EU states and assess vulnerabilities of the supply chain.

Proposal covering space equipment and related technology developments that are targeting a final TRL equal or higher than 5, shall include a list of proposed applicable standards (e.g. ECSS, ESCC, MIL, JEDEC, ...) that are considered relevant for implementing a formal space evaluation and/or qualification.

The proposal must include specific tasks as part of the work plan and related dedicated confidential deliverables to be provided within 6 months from the start of the project to the

relevant Commission DG and Executive Agency (i.e. DG-DEFIS and HaDEA), with the objective of:

1. Analysing and describing, **in detail**, the full supply chain, each entity and its role in the supply chain, level of criticality and, if relevant, identify dependencies from outside EU;
2. Describe the industrial technical roadmap and a business plan for commercialization with accurate understanding of applications needs, space mission insertion, including time to market indication, of the developed product.
3. Reporting the list of relevant non-EU export control with extra territorial applicability for the specific technology/product under development, independently from the supply chain established for the EU-COM project.
4. Undertaking a comprehensive literature review of the relevant technology/product reporting the state-of-the-art and highlighting potential gaps between current EU solutions and competition from outside EU.

Unless otherwise agreed with the granting authority before the grant agreement is signed, beneficiaries must ensure that none of the entities that participate as affiliated entities, associated partners or subcontractors are established in countries which are not eligible countries or target countries set out in the call conditions.

It is recalled to the applicants that all provisions reported by the Model Grant Agreements, related to topics with restricted eligibility conditions, are applied. Under this light, for example the consortiums shall ensure that for a period up to 4 years after the end of the action, supply and availability of the products and/or processes developed and/or qualified within the project (consortium as whole or individual beneficiaries) shall be given to any entity in EU, at fair and reasonable market prices, conditions and with no legal restrictions and limitations stemming for example from International Traffic in Arms Regulations (ITAR), or equivalent instruments applicable in non-EU jurisdictions. Additionally, beneficiaries that intend to transfer ownership or grant an exclusive licence must formally notify the granting authority before the intended transfer or licensing takes place and the granting authority may up to four years after the end of the action object to a transfer of ownership or the exclusive licensing of results.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content is not relevant.

HORIZON-CL4-2025-02-SPACE-73: Space Critical EEE Components for EU non-dependence - Connectors

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU</i>	The Commission estimates that an EU contribution of between EUR 0.80

<i>contribution per project</i>	and 1.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 1.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>The page limit of the application is 80 pages.</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely avoiding a situation of technological dependency on a non-EU source, in a global context that requires the EU to build on its strengths and to carefully assess and address strategic weaknesses, vulnerabilities and high-risk dependencies, participation is limited to legal entities established in Member States and the following associated countries: Norway and Iceland. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.²¹¹</p>

²¹¹ The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity,

	If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 5-6 by the end of the project. Activities may start at TRL 3. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: The granting authority can fund a maximum of one project.

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Reinforcing EU strategic autonomy by reducing non-EU dependencies on critical space EEE components and related technologies across their entire supply chain;
- Providing unrestricted access to critical space EEE components and related technologies relevant for EU space missions;
- Developing or regaining capacity to operate independently in space by developing resilient space EEE components and related technologies supply chains, relying on EU supply chains and/or trustable and reliable supply chains not affected by non-EU export restrictions;
- Enhancing competitiveness by developing products and capabilities reaching equivalent or superior performance level than those from outside the EU and compete at worldwide level;
- Opening new opportunities for manufacturers by reducing dependency on non-EU export restricted technologies.

Scope: Unrestricted access to state-of-art space EEE components and related technologies is a pre-requisite for the EU space industry responding to EU space missions. However, especially for some families of components, the available solutions in EU do not meet the current high-performance space requirements. Currently, alternative products sourced from outside EU, are either affected by non-EU export control, that limits its use, or present challenges in terms of trustable supply chains for the implementation of EU space missions with a security dimension.

Within the frame of this topic, it is expected to finance and implement development projects aiming at maturing critical space EEE components with the final goal of lowering the

and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

dependency from outside EU. This will be done by establishing a long-term sustainable supply chain for supporting EU strategic autonomy in the space sector. The selection of the supply chains shall reflect this objective. Therefore, the supply chain shall preferably be built fully based in EU and when this can only be achieved partially (i.e. because of lack of current EU capabilities for unrestricted advanced semiconductor processes or advanced materials that cannot be developed within the project), services procured from outside EU shall nevertheless ensure that the overall supply chain will remain trustable and not affected by non-EU export control. The latest scenario is subject to the approval of the granting authority.

Below, the space EEE component and related technologies relevant for this Call. It has been identified based on needs related to strategic institutional space programs, inputs from European stakeholders and the EU Observatory of Critical Technologies:

- Connectors [Target final TRL 5-6]

Additional context information and technical requirements are provided in the Technical Requirements Guidance document published on the Funding & Tenders Portal.

Space is a low volume market affected by a dynamic industrial landscape compared to the terrestrial market therefore, technological spin in and/or bilateral collaborations should be enhanced between European non-space and space industries. Furthermore, proposed activities should be complementary to relevant national and/or other activities at European level. Complementary activities should be clearly identified, described and the proposal should report how the complementarity is ensured.

To achieve the non-dependence objective, applicants are expected to include a dedicated proposal's paragraph covering:

- The description of the technology and/or technology processes and high-level breakdown of the space EEE component supply chain to be used. Applicants should demonstrate that the supply chain and final product are free of any legal export restrictions or limitations, such as those established in the International Traffic in Arms Regulations (ITAR) or equivalent instruments applicable in other non-EU jurisdictions. Applicants shall also report, in a dedicated subsection, if and which part of the supply chain is affected by non-EU export controls such as the Export Administration regulation (EAR) i.e. EAR99.
- The description of the suitable technology development process that has been identified and set up within the consortium for avoiding export restrictions of non-EU states and assess vulnerabilities of the supply chain.

Proposal covering space EEE components and related technology developments that are targeting a final TRL equal or higher than 5, shall include a list of proposed applicable standards (e.g. EN, ECSS, ESCC, MIL, JEDEC,...) that are considered relevant for implementing a formal space evaluation and/or qualification. Additionally, projects that aim at a formal space qualification shall deliver the full data pack planned to be submitted to the qualification authority. This deliverable shall be marked sensitive and it shall be shared with

the granting authority (i.e. DG-DEFIS and HaDEA). Products that will successfully complete the space evaluation/qualification either within the EU-COM activity or as a consecutive follow up shall inform DG-DEFIS and engrave on the package, or if relevant, die the EU flag.

The proposal must include specific tasks as part of the work plan and related dedicated confidential deliverables to be provided within 6 months from the start of the project to the relevant Commission DG and Executive Agency (i.e. DG-DEFIS and HaDEA), with the objective of:

- Analysing and describing, **in detail**, the full supply chain, each entity and its role in the supply chain, level of criticality and, if relevant, identify dependencies from outside EU;
- Describing the industrial technical roadmap and a business plan for commercialization with accurate understanding of applications needs, space mission insertion, including time to market indication, of the developed product.
- Reporting the list of relevant non-EU export control with extra territorial applicability for the specific technology/product under development, independently from the supply chain established for the EU-COM project.
- Undertaking a comprehensive literature review of the relevant technology/product reporting the state-of-the-art and highlighting potential gaps between current EU solutions and competition from outside EU.

Unless otherwise agreed with the granting authority before the grant agreement, beneficiaries must ensure that none of the entities that participate as affiliated entities, associated partners or subcontractors are established in countries which are not eligible countries or target countries set out in the call conditions.

It is recalled to the applicants that all provisions reported by the Model Grant Agreements, related to topics with restricted eligibility conditions, are applied. For example, under this light, the consortiums shall ensure that for a period up to 4 years after the end of the action, supply and availability of the products and/or processes developed and/or qualified within the project (consortium as whole or individual beneficiaries) shall be given to any entity in EU, at fair and reasonable market prices, conditions and with no legal restrictions and limitations stemming for example from International Traffic in Arms Regulations (ITAR), or equivalent instruments applicable in non-EU jurisdictions. Additionally, beneficiaries that intend to transfer ownership or grant an exclusive licence must formally notify the granting authority (i.e. DG-DEFIS and HaDEA) before the intended transfer or licensing takes place and the granting authority may up to four years after the end of the action object to a transfer of ownership or the exclusive licensing of results.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content is not relevant.

HORIZON-CL4-2025-02-SPACE-74: Space Critical EEE Components for EU non-dependence – Advanced Packages and Memories

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 2.50 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 6.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Admissibility conditions</i>	<p>The conditions are described in General Annex A. The following exceptions apply:</p> <p>The page limit of the application is 80 pages.</p>
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, or security, namely avoiding a situation of technological dependency on a non-EU source, in a global context that requires the EU to build on its strengths and to carefully assess and address strategic weaknesses, vulnerabilities and high-risk dependencies, participation is limited to legal entities established in Member States and the following associated countries: Norway and Iceland. Proposals including entities established in countries outside the scope specified in the call/topic/action will be ineligible.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication</p>

	<p>networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.²¹²</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	<p>Activities are expected to achieve TRL 6-7 by the end of the project. Activities may start at TRL 3 for what concerns advanced packages while TRL 5 for what concerns memories. The reference TRL definition is the ISO 16290:2013 applicable to the space sector.</p>
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>To ensure a balanced portfolio covering all the development areas described in the scope section, grants will be awarded to applications not only in order of ranking but at least also to one proposal that is the highest ranked within each development area, provided that the applications attain all thresholds</p>

Expected Outcome: Project results are expected to contribute to all of the following expected outcomes:

- Reinforcing EU strategic autonomy by reducing non-EU dependencies on critical space EEE components and related technologies across their entire supply chain;
- Providing unrestricted access to critical space EEE components and related technologies relevant for EU space missions;
- Developing or regaining capacity to operate independently in space by developing resilient space EEE components and related technologies supply chains, relying on EU supply chains and/or trustable and reliable supply chains not affected by non-EU export restrictions;

²¹²

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

- Enhancing competitiveness by developing products and capabilities reaching equivalent or superior performance level than those from outside the EU and compete at worldwide level;
- Opening new opportunities for manufacturers by reducing dependency on non-EU export restricted technologies.

Scope: Unrestricted access to state-of-art space EEE components and related technologies is a pre-requisite for the EU space industry responding to EU space missions. However, especially for some families of components, the available solutions in EU do not meet the current high-performance space requirements. Currently, alternative products sourced from outside EU, are either affected by non-EU export control, that limits its use, or present challenges in terms of trustable supply chains for the implementation of EU space missions with a security dimension.

Within the frame of this topic, it is expected to finance and implement development projects aiming at maturing critical space EEE components with the final goal of lowering the dependency from outside EU. This will be done by establishing a long-term sustainable supply chain for supporting EU strategic autonomy in the space sector. The selection of the supply chains shall reflect this objective. Therefore, the supply chain shall preferably be built fully based in EU and when this can only be achieved partially (i.e. because of lack of current EU capabilities for unrestricted advanced semiconductor processes or advanced materials that cannot be developed within the project), services procured from outside EU shall nevertheless ensure that the overall supply chain will remain trustable and not affected by non-EU export control. The latest scenario is subject to the approval of the granting authority.

Below, the list of space EEE components and related technologies relevant for this Call. It has been identified based on needs related to strategic institutional space programs, inputs from European stakeholders and the EU Observatory of Critical Technologies:

- Advanced packages – Organic substrate for very high, fine pitch [Target final TRL 6-7]
- MRAM Memories [Target final TRL 7]

Additional context information and technical requirements are provided in the Technical Requirements Guidance document published on the Funding & Tenders Portal outlining all relevant information for each of the above-mentioned development lines.

A proposal should address only one technology area and clearly identify the area being addressed.

Space is a low volume market affected by a dynamic industrial landscape compared to the terrestrial market therefore, technological spin in and/or bilateral collaborations should be enhanced between European non-space and space industries. Furthermore, proposed activities should be complementary to relevant national and/or other activities at European level. Complementary activities should be clearly identified, described and the proposal should report how the complementarity is ensured.

To achieve the non-dependence objective, applicants are expected to include a dedicated proposal's paragraph covering:

- The description of the technology and/or technology processes and high-level breakdown of the space EEE component supply chain to be used. Applicants should demonstrate that the supply chain and final product are free of any legal export restrictions or limitations, such as those established in the International Traffic in Arms Regulations (ITAR) or equivalent instruments applicable in other non-EU jurisdictions. Applicants shall also report, in a dedicated subsection, if and which part of the supply chain is affected by non-EU export controls such as the Export Administration regulation (EAR) i.e. EAR99.
- The description of the suitable technology development process that has been identified and set up within the consortium for avoiding export restrictions of non-EU states and assess vulnerabilities of the supply chain.

Proposal covering space EEE components and related technology developments that are targeting a final TRL equal or higher than 5, shall include a list of proposed applicable standards (e.g. EN, ECSS, ESCC, MIL, JEDEC,...) that are considered relevant for implementing a formal space evaluation and/or qualification. Additionally, projects that aim at a formal space qualification shall deliver the full data pack planned to be submitted to the qualification authority. This deliverable shall be marked sensitive and it shall be shared with the granting authority (i.e. DG-DEFIS and HaDEA). Products that will successfully complete the space evaluation/qualification either within the EU-COM activity or, as a consecutive follow up, shall inform DG-DEFIS and engrave on the package (if present) the EU flag.

The proposal must include specific tasks as part of the work plan and related dedicated confidential deliverables to be provided within 6 months from the start of the project to the relevant Commission DG and Executive Agency (i.e. DG-DEFIS and HaDEA), with the objective of:

- Analysing and describing, **in detail**, the full supply chain, each entity and its role in the supply chain, level of criticality and, if relevant, identify dependencies from outside EU;
- Describing the industrial technical roadmap and a business plan for commercialization with accurate understanding of applications needs, space mission insertion, including time to market indication, of the developed product.
- Reporting the list of relevant non-EU export control with extra territorial applicability for the specific technology/product under development, independently from the supply chain established for the EU-COM project.
- Undertaking a comprehensive literature review of the relevant technology/product reporting the state-of-the-art and highlighting potential gaps between current EU solutions and competition from outside EU.

Unless otherwise agreed with the granting authority before the grant agreement, beneficiaries must ensure that none of the entities that participate as affiliated entities, associated partners or subcontractors are established in countries which are not eligible countries or target countries set out in the call conditions.

It is recalled to the applicants that all provisions reported by the Model Grant Agreements, related to topics with restricted eligibility conditions, are applied. For example, under this light, the consortiums shall ensure that for a period up to 4 years after the end of the action, supply and availability of the products and/or processes developed and/or qualified within the project (consortium as whole or individual beneficiaries) shall be given to any entity in EU, at fair and reasonable market prices, conditions and with no legal restrictions and limitations stemming for example from International Traffic in Arms Regulations (ITAR), or equivalent instruments applicable in non-EU jurisdictions. Additionally, beneficiaries that intend to transfer ownership or grant an exclusive licence must formally notify the granting authority (i.e. DG-DEFIS and HaDEA) before the intended transfer or licensing takes place and the granting authority may up to four years after the end of the action object to a transfer of ownership or the exclusive licensing of results.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content is not relevant.

Heading 9 – Boosting Space through international cooperation

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-02-SPACE-81: EU-Japan cooperation on the exploitation of Quantum Space Gravimetry data

Call: SPACE-HADEA	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 0.45 and 0.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 0.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>The following additional eligibility criteria apply: Subject to restrictions for the protection of European communication networks.</p> <p>The following additional eligibility criteria apply: In order to achieve</p>

	<p>the expected outcome of the action, the consortium must include at least one legal entity established in Japan.</p> <p>If projects use satellite-based earth observation, positioning, navigation and/or related timing data and services, beneficiaries must make use of Copernicus and/or Galileo/EGNOS (other data and services may additionally be used).</p>
<i>Technology Readiness Level</i>	Activities are expected to achieve TRL 3 by the end of the project. The reference TRL definition is the ISO 16290:2013 applicable to the space sector. Activities may start at any TRL.
<i>Procedure</i>	<p>The procedure is described in General Annex F. The following exceptions apply:</p> <p>The granting authority can fund a maximum of one project.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²¹³.</p>

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- Support the EU space policy and the EU green deal by preparing the grounds for an innovative Quantum Space Gravimetry (QSG) mission.
- Foster EU-Japan cooperation in the field of quantum sensing from space.
- Allow scientists from EU and Japan to prepare for the exploitation of QSG mission data.

Scope: The development of quantum sensing technology brings several promises and expectations, in terms of sensor performances and stability. However, in order to best exploit quantum sensors, it is critical to prepare the scientific community to use the data generated by such sensors, develop new or tailor existing processing algorithms, and initiate and develop new applications based on this enhanced data.

The objective of this call is to prepare the grounds for the exploitation of Quantum Space Gravimetry mission data and foster the cooperation between the EU and Japan scientific

²¹³ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

communities on the topic. Effective QSG data exploitation requires research and dissemination activities to demonstrate the benefits of space-borne gravity field data and involve the relevant user institutions at early stage. To achieve this objective, one proposal will be selected. The proposal will identify Earth science fields relying on space gravity data exploitation and of mutual EU-Japan interest and will propose innovative algorithmic solutions highlighting the benefits of quantum space gravimetry. The proposal will discuss the expected QSG mission performance.

Horizon Europe will fund EU scientists only. Japan scientists will fund their own activities, expected to be at the same level as the EU contribution.

In this topic, the integration of the gender dimension (sex and gender analysis) in research and innovation content should be addressed only if relevant in relation to the objectives of the research effort.

Heading 10 – Boosting Space through training and education activities

For a description of topics related to training and education activities please refer to “Public Procurement” in the section “Other Actions” of this work programme.

Heading 11 – Boosting Space through IOD/IOV opportunities

For a description of topics related to the IOD & IOV opportunities, please refer to please refer to "Indirectly managed actions by ESA" in the section "Other Actions" of this work programme.

Heading 12 – Boosting Space through support to entrepreneurship

For a description of topics related to Cassini Entrepreneurship, please refer to “Public Procurement” in the section “Other Actions” of this work programme

Destination 6: Digital and industrial technologies driving human-centric innovation

New ways of working, assisted by technologies for physical or cognitive augmentation (exoskeletons, digital twins, collaborative AI, virtual and extended reality) will increase efficiency, safety and quality of work, provided they are trustworthy, safe and reliable, as well as human-centric and free from gender, racial and other social biases by design. Within the dynamic context of flexible organisation and process flows, workers will have to be empowered to co-create their new forms of working and collaboration within and across organisations, through participation, social innovation or living labs, where social economy actors and local grassroots initiatives are of particular importance. New job profiles and skills will emerge, often requiring digital competence, in addition to social and green skills (e.g. awareness of impact, circularity options). Continuous learning, through formal training, on-the-job learning or being immersed in virtual worlds, combined with appropriate certification and reward mechanisms can boost the attractiveness of careers in many sectors, including manufacturing. A new dynamic, in the spirit of Industry 5.0, will be brought to the workplace through better human interaction with production technologies, open innovation, supporting young professionals' innovations in e.g. manufacturing, as well as participation of new actors, such as fablabs. Digital environments and virtual worlds will enable new forms of collaboration in generating new product and process ideas, assisted by digital twins and AI, in an inclusive, trustworthy and ethical fashion.

Just like today's internet, the future internet will drive industrial, social and cultural innovation. Destination 6 will develop technologies for an inclusive, gender-equal, trustworthy and humancentric internet. This will build on a more resilient, sustainable, and decentralised architecture, empower end-users with more control over their data and their digital identity, and enable new social and business models that respect European values. The destination will also spearhead the use of virtual worlds and digital twins where they can make a real difference. Industrial virtual worlds could increase productivity, improve working conditions and access to work, and address and anticipate skills gaps for highly complex products/services or for safety-critical operations. Smart communities and 'citiverses' can empower public authorities and people to fulfil their aspirations. To reach the ambitious goal of achieving trustworthy AI, 'compliant by design' with the AI Act – challenges such as accuracy, robustness, transparency and efficiency have to be addressed, along eliminating biases in data entry to assure fairness in light of individual differences, e.g. in gender or age, and intersectional diversity. Increasing the cognitive level of AI systems (like from combining data-driven and symbolic learning) is crucial for their wider uptake and acceptance. Smart 'technology-for-trust' (e.g. blockchain for identity and transaction tracking, AI to counter biases, deep-fake recognition, fact checking) will also have a role. The Cluster will focus particularly on generative AI (addressing algorithms, data and computational resources), foundational models and language technologies to gain strategic autonomy in this area. This is expected to trigger a whole range of new applications in entertainment, education and commerce, starting with assisted and virtual content production, and on demand synthetic media. Beyond these, the possibilities in industrial settings (e.g. robotics, training, process planning, quality assurance), in public services and public administrations are largely

untapped. Involvement of social sciences and humanities will help bring benefits and respect for European values. Specific measures are needed to allow start-ups and smaller companies to use and benefit from AI, data (including by enabling access to the high-performance computing power needed), photonics and robotics, and to play an active part in developing the next generation of smart technologies within a diverse and open European innovation ecosystem. Similarly, the responsible use of AI in science, research and engineering is going to be key for keeping up the scientific and technological global competitiveness of the EU. These elements will also contribute to the EU's Apply AI Strategy, a comprehensive approach aimed at establishing Europe as a global leader in the development and adoption of AI, by fostering a vibrant AI ecosystem and making Europe a hub for AI innovation and growth, where world-class AI models are developed and integrated into strategic sectors. This initiative is designed to drive innovation, economic growth, and competitiveness, while ensuring that the benefits of AI are shared by all. The topics related to Generative AI included in this destination will support the implementation of the GenAI4EU initiative included in the AI Innovation Package of 24 January 2024, and constitute an integral part of the broader Apply AI strategy, aiming to create a cohesive and coordinated approach to AI development and adoption, one that promotes European excellence and leadership in this critical field. A well-functioning European ecosystem of digital commons, based on open technologies and driven by European values, and a thriving culture of collaboration and social innovation are essential for ensuring sovereignty, trust and user empowerment. New software engineering techniques are needed that are applicable from core to edge and across the entire software stack to build the open distributed systems that the cluster envisages. AI-driven as well as low-code methodologies will help address shortages of digital skills, increase productivity and allow for point-of-use configuration and personalisation.

This destination is structured around the following headings:

Virtual Worlds

The objective of this heading is to gain industrial leadership in Virtual Worlds technology at large (eg. eXtended Reality technologies and immersive environments), while ensuring the European values of privacy, ethics and inclusiveness. It also aims at advancing immersive virtual experiences, supporting a user-centered Web 4.0, and building a sustainable digital ecosystem within Europe. The efforts will notably focus on advancing immersive experiences, enhancing virtual world technologies, and support the launch of the new European Partnership on Virtual Worlds that will drive innovation, access resources, and foster industry collaboration across the virtual worlds' value chain.

AI-GenAI / Data / Robotics

The GenAI4EU HUB aims to build a vibrant European GenAI ecosystem by fostering collaboration, visibility, and innovation across strategic sectors. This initiative supports the European Commission's AI Office in creating a trustworthy AI ecosystem that maximizes societal and economic benefits. It will coordinate efforts among stakeholders—ranging from local GenAI communities and startups to large industries—enhancing the EU's GenAI impact and visibility. Additionally, it will monitor the EU GenAI landscape, assess market needs, and

disseminate findings to foster a cohesive and innovative GenAI environment. The HUB also aligns with European partnerships like ADRA, ensuring integration with existing initiatives and contributing to the EU's leadership in AI and GenAI advancements.

Standardisation and Knowledge Valorisation

Linked to the importance of deploying the results of research and innovation in the Union, in order to achieve economic, environmental and social outcomes, a number of topics in this Work Programme will support essential efforts in knowledge valorisation and standardisation; and in improving access to technology infrastructures.

International Cooperation

The proposed international coordination and support actions are aligned with the Commission's international priorities. They will help build strong international digital partnerships and promote a human-centred digital agenda. International cooperation will further a level playing field and reciprocity while delivering new solutions to digital challenges. Through evidence-based advice and joint actions with leading semiconductor nations like Japan, South Korea, Taiwan, Singapore, the USA, Canada, and India, the aim is to bolster Europe's role in the global semiconductor value chain. This includes guiding the European Commission on research collaborations and policy measures while providing factual insights into emerging technologies and global supply chains. In parallel, proposed actions will focus on strengthening international cooperation in the semiconductor sector and advancing Generative AI (GenAI) initiatives in Africa. The aim would be to empower African societies, particularly rural communities and women, by equipping local technology companies with the tools to leverage GenAI for innovative solutions in key areas, thereby unlocking its potential for social and economic development in Africa.

Virtual Worlds

Proposals are invited against the following topic(s):

**HORIZON-CL4-2025-03-HUMAN-14: Core technologies for virtual worlds (RIA)
(Virtual Worlds and Photonics Partnerships)**

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 5.00 and 6.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 43.00 million.
<i>Type of Action</i>	Research and Innovation Actions

<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 3 and achieve TRL 5 by the end of the project – see General Annex B.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: To ensure a balanced portfolio covering the two areas described, grants will be awarded to applications not only in order of ranking but at least also to two proposals that are the highest ranked within each of the two areas described, provided that the applications attain all thresholds.

Expected Outcome: Proposals are expected to contribute to developing core technologies for Virtual Worlds, with a focus on better, more realistic and more performant interaction and immersion, at application and components levels. The following outcomes are expected:

- Area A: Better and more realistic immersion through multimodal interaction. Project results are expected to contribute to the following expected outcome:
 - Improvement of the multimodal immersion experience combining eXtended Reality with advanced and innovative technologies.
- Area B: Innovative photonics technologies for projection, sensing and perception in virtual worlds. Project results are expected to contribute to the following expected outcome:
 - Improved performance of microdisplays or sensing devices serving Virtual Worlds by using innovative Optics and Photonics technologies.

Proposals are expected to focus on either Area A or Area B. The area should be clearly identified within the proposal. Special attention will be given to proposals (whether Area A or Area B) including transdisciplinary research in order to deliver and enhance uptake of suitable, accurate, ethical and safe solutions.

Proposed applications should aim at increasing awareness, acceptance and adoption of virtual worlds applications across sectors.

Scope: Virtual worlds will impact the way people live, work, create and share content, the way public administrations interact with citizens as well as the way businesses operate, innovate, produce and interact with customers.

Multimodal interaction and immersion are key dimensions of Virtual Worlds and will be supported by innovative optics and photonics technologies to achieve the full potential of Virtual Worlds core technologies.

A broader adoption of Virtual Worlds will need better and more realistic immersion and interaction, mixing modalities, sensors and actuators for an ever-improved user experience: touch, smell, haptics, etc will be better stimulated, bringing users closer to real-world sensations, serving Virtual Worlds.

Many challenges remain to be addressed to realize optics and photonics technical solutions that offer high-performance, excellent visual quality, high-quality user experience, and sustainable services and devices, for head-mounted displays (HMD), autostereoscopic displays or sensing devices.

Coupled with display and sensing technologies, algorithms and metrics should be considered to exploit the underlying light (transportation) models given the utilized modality and address e.g. scene representation, content generation, compression, transmission, content reconstruction, content-to-display adaptation, or rendering. Moreover, the quality of integration, both from a user and technological perspective, will be essential for a broad adoption of Virtual Worlds.

The Area A proposals under this topic should develop and demonstrate novel applications for Virtual Worlds that combine several modalities and aim to provide seamless and more realistic immersive interactions. Proposals should investigate novel scientific approaches or push the limit of existing ones to improve the synchronization and integration of the different modalities.

Proposals should focus on an enhanced use of multimodal technologies, integrating at least two modalities within an extended reality application. Modalities include haptics and force-feedback, vision, touch, smell, speech, etc.

The Area B proposals should address the development and integration of advanced innovative and high-performance Optics and Photonics technologies for display and sensing devices serving Virtual Worlds.

- For displays further improve current high-end microdisplays regarding power consumption (<1 mW), device efficiency, resolution (8K and beyond, pixel densities $> 10\text{kppi}$), high dynamic range (HDR), colour gamut, contrast and refresh rate holding the promise for truly immersive experiences;
- For sensing devices improve accuracy in diverse lighting conditions and with different eye physiologies.

Special attention should be given to the design and fabrication of suited waveguide optics, holographic elements, diffractive optics, reflective light guides, freeform optics (including micro-optics), or meta-surfaces with optimal optical properties and behaviour; to support the required field of view (FoV), to be lightweight and safe for the user, and provide excellent colour uniformity and high brightness efficiency; to satisfy the use case requirements for both professional use and mass adoption, i.e., be scalable to large volumes and cost-effective; to integrate targeted systems seamlessly into mixed-reality devices without increasing bulk or reducing comfort.

For both Area A and Area B proposals, the quality of integration, both from a user and technological perspective, will be essential for a broad adoption of Virtual Worlds. The proposals should include a focus on human perception and experience, from subjective, objective, and functional perspectives, and take into account EU values such as inclusivity, privacy, security and safety of users and the protection of their personal data, as well as diversity. Solutions should guarantee the privacy and rights of individuals and companies and ensure secure and trustworthy interactions to deliver and enhance uptake of suitable, accurate, ethical and safe solutions.

The Consortium should pay attention to developing solutions that are reliable, robust and interoperable. Proposals should leverage existing open standards and technologies in the domain of eXtended Reality, while contributing to ongoing standardisation work. Applications should be tested and anchored in real world environments and aimed at least one application domain.

We consider that proposals with an overall duration of typically 36 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations.

Proposals should involve the effective contribution of Social Sciences and Humanities (SSH) disciplines and SSH experts, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

This topic is implemented through a joint effort from the co-programmed European Partnership for Virtual Worlds and the Photonics Partnership and all proposals are expected to allocate tasks for cohesion activities with both partnerships, including the CSA HORIZON-CL4-2025-03-HUMAN-17: Specific support for the Virtual Worlds Partnership and the Web 4.0 initiative.

HORIZON-CL4-2025-03-HUMAN-15: GenAI4EU: Generative AI for Virtual Worlds: Advanced technologies for better performance and hyper personalised and immersive experience (IA) (AI/Data/Robotics & Virtual Worlds Partnerships)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 4.00 and 5.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 20.00 million.
<i>Type of Action</i>	Innovation Actions

<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway and the following additional associated countries: Canada, Israel, the Republic of Korea, New Zealand, Switzerland, and the United Kingdom.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, may not participate in the action unless it can be demonstrated, by means of guarantees positively assessed by their eligible country of establishment, that their participation to the action would not negatively impact the Union's strategic assets, interests, autonomy, or security. Entities assessed as high-risk suppliers of mobile network communication equipment within the meaning of 'restrictions for the protection of European communication networks' (or entities fully or partially owned or controlled by a high-risk supplier) cannot submit guarantees.²¹⁴</p>
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 4 and achieve TRL 6 by the end of the project – see General Annex B.

Expected Outcome: Project results are expected to contribute to at least one of the following expected outcomes:

- Realistic, creative and innovative characters, user-tailored artefacts, and Virtual Worlds for a better immersion and significantly improved user experience.

²¹⁴

The guarantees shall in particular substantiate that, for the purpose of the action, measures are in place to ensure that: a) control over the applicant legal entity is not exercised in a manner that retrains or restricts its ability to carry out the action and to deliver results, that imposes restrictions concerning its infrastructure, facilities, assets, resources, intellectual property or know-how needed for the purpose of the action, or that undermines its capabilities and standards necessary to carry out the action; b) access by a non-eligible country or by a non-eligible country entity to sensitive information relating to the action is prevented; and the employees or other persons involved in the action have a national security clearance issued by an eligible country, where appropriate; c) ownership of the intellectual property arising from, and the results of, the action remain within the recipient during and after completion of the action, are not subject to control or restrictions by non-eligible countries or non-eligible country entity, and are not exported outside the eligible countries, nor is access to them from outside the eligible countries granted, without the approval of the eligible country in which the legal entity is established.

- Smart digital assistants and 3D chatbots for a safe and inclusive navigation.

Scope: Generative AI, at the edge and integrated in devices, will bring better performance, a more personalised and a more immersive experience for an inclusive and wider adoption of Virtual Worlds. Small and frugal AI models would enable faster inference contributing to lower latency while improving security and privacy by processing data closer to the user, preserving EU Values. Smart digital assistants will accompany users throughout their journey within Virtual Worlds, bringing new innovative communication modalities, advancing collaborative intelligence and decision-making AI capabilities.

Innovation actions proposals are expected to address:

Generative AI – Realistic and innovative Virtual Worlds for a better immersion:

Proposals should use Generative AI to build on the users' expectations to create either safe and inclusive virtual spaces, realistic environments, or creative and beyond reality ones. They should develop dynamic Storytelling and scenarios to enable creative content that is personalised leading to unique experiences for the users or shared with other users. They should also use AI to enable generation of personalised avatars aiming to provide seamless and more realistic immersive interaction.

Generative AI – Smart digital assistance for a safe and inclusive navigation in Virtual Worlds:

Proposals should develop smart people-centered and accessible digital assistants and 3D chatbots (AI-enhanced communicating 3D avatars), to for example, enhance training and education, remove language barriers or language disorders through instant translation, including sign languages, remove barriers to persons with disabilities, offer sentiment analysis and behavioural decision support systems, enable users to adapt to various interlocutors from various cultures, languages and backgrounds, contributing to navigate in inclusive and safe Virtual Worlds, while offering users new adapted learning modalities. When relevant, proposals can capitalise on latest developments in generative AI, to bring step change in explainable collaborative intelligence and decision-making capabilities by dedicated specific research.

We consider that proposals with an overall duration of typically 36 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations.

Proposals should involve the effective contribution of Social Sciences and Humanities (SSH) disciplines and SSH experts, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

This topic is implemented as a joint effort between the co-programmed European Partnership for Virtual Worlds and the co-programmed European Partnership on AI, data and robotics (ADRA), and all proposals are expected to allocate tasks for cohesion activities with both partnerships, including the CSA HORIZON-CL4-2025-03-HUMAN-17: Specific support for

the Virtual Worlds Partnership and the Web 4.0 initiative and the CSA HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub.

When possible, proposals should build on and reuse public results from relevant previous funded actions. Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

Proposals should also build on or seek collaboration with existing projects and develop synergies and complementarities with other relevant International, European, national or regional initiatives.

HORIZON-CL4-2025-03-HUMAN-16: Drive the evolution of the internet towards open and interoperable Web 4.0 and Virtual Worlds: building blocks in priority areas (RIA) (Virtual Worlds Partnership)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 14.50 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.
<i>Procedure</i>	The procedure is described in General Annex F. The following exceptions apply: To ensure a balanced portfolio covering all the areas described in the scope, grants will be awarded to applications not only in order of ranking but at least also to one application that is the highest ranked within each area, provided that the applications attain all thresholds.
<i>Legal and financial set-up of the Grant Agreements</i>	The rules are described in General Annex G. The following exceptions apply: Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. The

	<p>maximum amount to be granted to each third party is EUR 150 000. This is justified by the possibility for a third party to participate in several calls during the full duration of the pilot.</p> <p>A maximum of 15% of the total requested EU contribution may be allocated to financial support to third parties, selected through open calls.</p>
--	---

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- An early demonstration of the future Web 4.0 architectural framework (including protocols and standards) made up of key Open Source internet building blocks in priority areas: identity, software supply chain, open hardware, decentralised solutions & virtual worlds.
- The emergence of open and interoperable Web 4.0 and Virtual Worlds supported by EU based internet ecosystems centred on EU values and regulatory framework with high socio-economic impact, through the application of digital commons technologies and other Open Source solutions and open standards in several use cases.
- Supporting the transition from today's internet towards Web 4.0 where end-users have access to a more personalised and interactive experience through more collaborative, decentralised and user-centred approaches. Special attention will have to be given to security, scalability, and accessibility issues.
- New business opportunities and the emergence of new business and sustainability models based on Open Source.

Scope: The aim of this topic is to advance the evolution of the internet towards open and interoperable Web 4.0 enabling Virtual Worlds, ensuring seamless user experience navigating across platforms by increasing the take up of digital commons technologies and other Open Source solutions in Europe. The action will thus leverage the strong and active community of European Open Source innovators that can contribute to relevant digital commons to deliver on key features of virtual worlds.

This topic will support early demonstrations for Web 4.0 and its architectural framework, through the use of key building blocks where there is sufficient level of maturity and critical mass of commons contributors (such as in the context of the Next Generation Internet initiative).

The envisaged Web 4.0 shall be powered by open and decentralised technologies enabling interoperability between platforms and networks and freedom of choice for the users. It should be developed through Open Source / digital commons and tackle security, scalability and sustainability at the core of the technological developments.

Applicants should define the mechanisms for contributing to and aligning with the strategic roadmap for research and innovation and the architectural Framework as it becomes available from the specific separate support action HORIZON-CL4-2025-03-HUMAN-17: Specific support for the Virtual Worlds Partnership and the Web 4.0 initiative (CSA).

Applicants should devise appropriate mechanisms for cooperating with the other projects under this action to ensure that they work in a coherent way towards the vision of an open, interoperable Web 4.0

At least one proposal in each of the area defined below will be selected. Proposals should clearly identify the area they are addressing.

Area 1: Identity management

Proposals will support and facilitate the deployment and adoption of the EU Digital Identity Wallet with the testing, community development and packaging of Open Source solutions for the issuance and verification of electronic attestations and the provision of eIDAS trust services. The aim is to deliver a diversity of Open Source digital solutions and services in accordance with the European digital rights and principles, empowering citizens with the freedom of choice from many secure digital identity solutions that are aligned with the EU regulations. Additionally, to foster and support enterprises to harness the benefits of the EUDI wallet and the eIDAS trust services. Examples may include the implementation of EUDI wallets for Open Source operating systems, like Linux (for enterprise servers), cloud-based wallets, laptop-based wallets, Open Source Operating System for mobile devices. Furthermore, technical solutions and services for secure and anonymous digital payments and money transfers between people, solutions for the implementation for attestation issuers and verifiers and the eIDAS trust services with a focus on the development of Open Source stacks for issuers and relying parties (for issuing and verifying electronic attestations), especially as/for cloud services. When relevant, proposals may address the validation of physical documents, either IDs or other types of identity-related documents, such as breeder documents.

Area 2: Software Supply Chain security

Trusted frameworks are essential to keep the software supply chain secure, as demonstrated by the recent attack on XZ Utils. The aim is to strengthen the security of the software supply chain by leveraging related NGI building blocks and package solutions for example for traceability of code, collaborative trust models among contributors and users, detection of anomalous behaviour, construction of software bill of material. Use cases include developers and users of codes, DevSecOps team, corporate IT, Open Source projects, industry and/or parties that need to be compliant with the Cyber Resilience Act.

Area 3: Open Hardware

Open Hardware is key for supporting trust and sovereignty as it allows users to inspect, modify, and implement freely the designs. The aim is to support the uptake of Open Hardware chips and tools through prototyping, productization and integration in real life cases.

Proposals can address several re-usable tools and components such as controllers, processors, or network chips. Use cases include consumer devices for immersive virtual worlds, industry applications, consumer devices, smart cities.

Area 4: Alternative solutions to centralised platforms

As EU legislation places obligations on platforms, particularly focusing on gatekeepers, it is important to prioritize nurturing and enriching credible alternatives. Proposals in this area could cover integrating, testing and operation of Open Source decentralised solutions offering credible alternatives to users supporting the emergence of Web 4.0 and Virtual Worlds experience. Examples include instant messaging, application stores, or productivity groupware that should showcase virtual worlds interoperability, trust, resilience, and scalability. The focus should be made on decentralised and federated solutions based on interoperability requirements and on open standards to ensure to not only meet regulatory demands but also foster a more open, diverse, resilient, and competitive digital ecosystem.

Area 5: Web 4.0 demonstration for Virtual Worlds

Web 4.0 technologies enabling interoperability and transferability across platforms are crucial to ensure various players to contribute to virtual worlds as opposed to a mono-provider environment. This area will make use of existing Open Source building blocks for ensuring trust, interoperation, interconnection, transaction (including tokens), and resource access in Virtual Worlds applications and services. Proposals will aim at integrating the various building blocks, with a special focus on interoperability and will demonstrate seamless interactions (for example when browsing and searching across multiple providers) in one or two selected scenarios.

For all areas, proposals should innovate beyond the state-of-the-art and could include development, integration, testing, deployment, uptake, and operations activities.

Proposals should encourage, when relevant, open access to data, standardisation activities, as well as an IPR regime and sustainability model ensuring lasting impact and reusability of results.

The Commission considers that proposals with an overall duration of typically 24 to 36 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations.

This topic implements the co-programmed European Partnership on Virtual Worlds.

HORIZON-CL4-2025-03-HUMAN-17: Specific support for the Virtual Worlds Partnership and the Web 4.0 initiative (CSA) (Virtual Worlds Partnership)

Call: DIGITAL - CNECT
Specific conditions

<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.

Expected Outcome: The launch of the co-programmed new European Partnership for Virtual Worlds will help develop and promote a thriving industrial and end-user ecosystem in the EU, covering all the aspects of the virtual worlds value chain. It will also actively engage with people and society at large and provide access to a broader range of resources, including funding, expertise and technology.

This CSA should be prepared, managed and coordinated by the key stakeholders in this field. Project results are expected to contribute to the following expected outcomes:

1. The delivery of a Strategic Research and Innovation Agenda (SRIA) for Virtual Worlds in Europe, for useful, open, interoperable, inclusive, sustainable and trustworthy virtual worlds systems and applications, ensuring Virtual worlds reflect EU values and principles.
2. The delivery of a Strategic Research and Innovation Agenda (SRIA) for Web 4.0 in Europe leading to an inclusive, trustworthy, interoperable, and human-centric Web 4.0 leveraging open-source commons building blocks enabling new social and sustainability models that respect European values.
3. Established and running European Virtual Worlds Partnership supporting the European Virtual Worlds and Web 4.0 community.
4. A strong and competitive ecosystem, with European companies playing a leading role in the adoption and acceptance, and in the development and deployment of Virtual Worlds technologies.
5. Reinforced links among initiatives in virtual worlds in Horizon Europe, Digital Europe Programme, and other programmes at EU, national and regional levels.
6. Widespread awareness and outreach programmes

7. Increased adoption of virtual worlds that are open, accessible and inclusive, interdisciplinary, safe and respect ethical values and European legal framework, including regarding privacy, security in all Member States and Associated Countries
8. Standardisation methods for virtual worlds technologies and in support of the EU regulatory framework.

Scope: The selected proposal should provide specific support for the coming European Virtual Worlds Partnership.

The selected proposal should:

- Support to the Virtual Worlds Partnership to develop a strong and inclusive network by strengthening the links and promoting collaboration among academia, industry, public actors and end-users, including the major industrial European sectors and all relevant stakeholders, to guarantee strong coordinated efforts toward trustworthy and human-centric virtual worlds for the economy and society. The network will also include national representatives, to link to national programmes and to foster synergies and coordination between the various European, national, public and private initiatives. Such coordination of efforts in research, innovation and expertise will be important for Europe's leadership in virtual worlds. The objective is to support the community in defining and implementing the Virtual Worlds strategy for research, innovation, and deployment, and support the Partnership in its coordination and support of the community in non-R&D tasks as well.
- Support the development and implementation of a Strategic Research and Innovation Agenda for Virtual Worlds (SRIA).
- Support the development of a Strategic Research and Innovation Agenda (SRIA) for Web 4.0 in Europe and propose an implementation agenda of a European Web 4.0 strategy for research and innovation by defining the trajectories to drive the evolution of the internet towards Web 4.0. This should include the architectural framework (including standards and protocols) and principles, identifying its main building blocks. The implementation strategy should also identify the technology areas where Web 4.0 and Virtual Worlds can benefit from joint developments, reuse of technologies or exchanges.
- Support the emergence of a thriving European ecosystem for Web 4.0 where developers, research teams, industry and startups can boost technological capabilities, accelerate uptake of innovative solutions, and foster a supportive business environment. This community is expected to be involved in the definition of the architectural framework, its main building blocks and the implementation roadmap.
- Support and encourage the adoption of Virtual Worlds in all Member States and Associated Countries, with particular emphasis on geographical aspect and across the value chain.

- Develop and implement outreach programmes aiming at better understanding and awareness of Virtual Worlds including acceptability and trustworthiness, informing about potentialities of Virtual Worlds but also ensuring that public expectations are realistic to avoid backlash in the adoption. Such activities should target in particular the business community, with a particular focus on SMEs, as well as public administrators, citizens and civil society at large.
- Identify ethical, legal, societal and economic aspects of virtual worlds and actions on how to tackle possible issues. Particular attention should be paid to gender, racial, and other biases as well as mitigation measures.
- Support to standardisation in view of boosting virtual worlds industry, creating, and guaranteeing trustworthy and ethical Virtual Worlds, by bringing stakeholders together and, when needed, organise European representation in existing or new standardisation working groups in support of the Commission regulatory framework.

This topic implements the co-programmed European Partnership on Virtual Worlds and the initiative on Web 4.0.

Proposals are encouraged to build on, or seek collaboration with, existing projects and develop synergies and ensure complementarities with other relevant European, national or regional initiatives and funding programmes relevant for Web 4.0 and Virtual Worlds in Horizon Europe, Digital Europe Programme (such as the Common European Data spaces or the Digital Twins) and other programmes (European Innovation Council, Digital Innovation Hubs, European Digital Innovation Hubs, European Digital Infrastructure Consortia, the VR/AR Industrial Coalition, etc). Such synergies and complementarities should be developed through efficient mechanisms (e.g. joint task forces), organisation of joint events gathering projects, etc.

In particular links are encouraged with:

- HORIZON-CL4-2023-HUMAN-01-21: Next Generation eXtended Reality (RIA)
- HORIZON-CL4-2023-HUMAN-01-22: eXtended Reality for Industry 5.0 (IA)
- HORIZON-CL4-2023-HUMAN-01-23: Supporting the emergence of an open human-centric Metaverse (CSA)” In view of sharing knowledge and developing synergies, proposals are also encouraged to coordinate, establish links and ensure complementarities with relevant initiatives in this Work Programme, especially:
- HORIZON-CL4-2025-03-DATA-11: Open Internet Stack: development of technological commons/open-source 3C building blocks (RIA)
- HORIZON-CL4-2025-03-DATA-08: Large-scale pilots for supply end-to-end infrastructures integrating device, network computing and communication capabilities for Telco Edge Cloud deployments, as a basis for Connected Collaborative Computing Networks (3C networks) (RIA)

- HORIZON-CL4-2025-03-HUMAN-14: Core technologies for virtual worlds (RIA) (Virtual Worlds and Photonics Partnerships)
- HORIZON-CL4-2025-03-HUMAN-15: GenAI4EU: Generative AI for Virtual Worlds: Advanced technologies for better performance and hyper personalised and immersive experience (IA) (AI/Data/Robotics & Virtual Worlds Partnerships)
- HORIZON-CL4-2025-03-HUMAN-16: Drive the evolution of the internet towards open and interoperable Web 4.0 and Virtual Worlds: building blocks in priority areas (RIA) (Virtual Worlds Partnership)

Proposals are encouraged also to closely collaborate and build synergies and complementarities with other relevant European Partnerships (such as Data, AI and Robotics; Photonics, the European Blockchain Partnerships); Next Generation Internet (NGI) initiative, the European Flagships (such as Graphene), the EU supported digital twins initiatives (such as Destination Earth).

The Commission considers that proposals with an overall duration of typically 36 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations.

Proposals should involve the effective contribution of Social Sciences and Humanities (SSH) disciplines and SSH experts, in order to produce meaningful and significant effects enhancing the societal impact of the related research activities.

All proposals are expected to allocate tasks to cohesion activities with the Partnership on Virtual Worlds and funded actions related to this partnership.

AI-GenAI / Data / Robotics

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-03-HUMAN-18: GenAI4EU central Hub (CSA)
(AI/Data/Robotics Partnership)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Coordination and Support Actions

<i>Eligibility conditions</i>	<p>The conditions are described in General Annex B. The following exceptions apply:</p> <p>In order to achieve the expected outcomes, and safeguard the Union's strategic assets, interests, autonomy, and security, it is important to avoid a situation of technological dependency on a non-EU source, in a global context that requires the EU to take action to build on its strengths, and to carefully assess and address any strategic weaknesses, vulnerabilities and high-risk dependencies which put at risk the attainment of its ambitions. For this reason, participation is limited to legal entities established in Member States, Iceland and Norway, associated countries and OECD countries.</p> <p>For the duly justified and exceptional reasons listed in the paragraph above, in order to guarantee the protection of the strategic interests of the Union and its Member States, entities established in an eligible country listed above, but which are directly or indirectly controlled by a non-eligible country or by a non-eligible country entity, shall not participate in the action.</p>
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025) ²¹⁵.</p>

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- Creation of the GenAI4EU HUB: developing a strong and visible GenAI4EU community, supporting the uptake of European GenAI solutions across strategic application sectors and the HE Clusters, through collaboration and knowledge exchange.
- This CSA will also support and collaborate with the European Commission's AI Office in its function to promote an innovative ecosystem of trustworthy AI, to reap the societal and economic benefits.

Scope: This horizontal Coordination and Support Action for GenAI4EU will develop a strong and visible European GenAI ecosystem of developers and users, aiming to strengthen the

²¹⁵ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

coordination, impact and visibility of the GenAI4EU initiative²¹⁶ across diverse sectors. This CSA should be prepared, managed and coordinated by the key stakeholders in this field, in particular those active in developing local GenAI communities, tech transfer, attracting investment, and making the European GenAI stakeholders visible.

Serving as a hub for collaboration, this project seeks to streamline efforts in developing high-impact GenAI-based applications while fostering cooperation among various GenAI stakeholders, from startups, academia and large user industries, including large IT suppliers and integrators.

It will support all the Horizon Europe Pillar 2 clusters, in addressing their policy needs through the implementation of the GenAI4EU initiative, in particular in supporting mechanisms to pool efficiently and make sufficient data of high quality available (in particular from the European Data Spaces, but exploiting other sources of data as appropriate), and facilitate collaboration with the AI Factories.

The proposed project is expected to involve close collaboration and coordination among the projects implementing GenAI4EU, developing a strong community. It should also help them to maximise their impact and increase their visibility.

It should also foster the uptake in all strategic application sectors, namely the ones addressed in the GenAI4EU initiative, including the 14 industrial ecosystems²¹⁷, in stimulating collaborations between the European developers and users.

The selected proposal will foster collaboration between the AI Factories, the Data Spaces (as well as other data providers) and the SIMPL infrastructure, in establishing mechanisms to make data available in the AI factories, in particular for the training, and possibly fine-tuning of large GenAI models, while respecting IP or privacy/GDPR of the entities/industries providing their data. This should build on relevant initiatives, such as data intermediation services, with a view of using a trusted third party to ensure no exchanges between industry competitors for instance, while defining mechanisms to access (and if needed pooling of) critical amount of data, required for the training of very large models. This will require mobilisation of industries owning large sets of data, defining with them such mechanisms acceptable to all, and implementing them through secure infrastructures, protocols, interoperability mechanisms, within the various projects implementing GenAI4EU in the various clusters.

The proposal will also support Common European Data Spaces to coordinate standard setting approaches for further data sharing and data interoperability among them or with the AI Factories.

²¹⁶ <https://digital-strategy.ec.europa.eu/en/library/communication-boosting-startups-and-innovation-trustworthy-artificial-intelligence>

²¹⁷ The 14 strategic industrial ecosystems identified in the European Industrial strategy (Strategy - European Commission (europa.eu)) are: construction, digital industries, health, agri-food, renewables, energy intensive industries, transport and automotive, electronics, textile, aerospace and defence, cultural and creative culture industries, tourism, proximity and social economy, and retail

The selected proposal will also ensure collaboration between the GenAI4EU projects, and the relevant the AI Factories, for the computing resources, and the data spaces. Moreover, a few specific working groups among stakeholders should be established in key European industrial / application sectors (such as in Robotics / Manufacturing, Automotive, energy, pharmaceuticals, etc.). Their aim will be to bring together key stakeholders of the sector (incl. startups / SMEs and large companies) and foster discussions among them for stimulating their cooperation in developing GenAI models relevant for their sector, but also on how to address access to existing large data sets, incl. their interoperability and use for GenAI models and/or any other elements necessary for enabling an effective development and further grow of the sector's GenAI ecosystem.

The proposal will also ensure connection with the AI on Demand platform providing support for fine-tuning pre-trained models and developing innovative downstream applications, the GenAI4EU Skills, and relevant activities implemented under the EU's Digital Europe Programme, Horizon Europe Programme as well as national activities. The selected proposal is also expected to build on or seek collaboration with existing and upcoming projects and develop synergies and ensure complementarities with other relevant European, national or regional initiatives, funding programmes and platforms.

The CSA is expected to constantly monitor the way the EU GenAI ecosystem, including the AI factories, is developing. More broadly, the selected proposal will act as a global observatory for GenAI conducting a comprehensive landscape analysis of GenAI, including data on market, research, funding, patent and more broadly the state of the advancement of GenAI in the EU and worldwide. This includes an inventory of use cases, capabilities, evaluation tools and methods to assess generative AI models. The selected proposal is expected to widely disseminate this analysis at least twice a year to the stakeholders, including the EU, the Member States and Associated Countries.

It will also assess the uptake of GenAI by large European industry (including technology suppliers and user industry), and mobilise them to engage in GenAI4EU initiatives and drive the future strategy for the development and uptake of GenAI solution “made in Europe” in all strategic industries.

By identifying prioritized sectors and sharing best practices, the project aims to bridge existing gaps, connect stakeholders and foster innovation uptake.

Furthermore, the selected proposal will assess potential areas that require further R&D, including coordination with national initiatives, to ensure comprehensive coverage and collaboration. It will actively engage in networking and community animation to foster knowledge exchange and collaboration among stakeholders.

When possible, proposals should build on and reuse public results from relevant previous funded actions. Communicable results should be shared with the European R&D community through the AI-on-demand platform, and if necessary, other relevant digital resource platforms to bolster the European AI, Data, and Robotics ecosystem by disseminating results and best practices.

This topic implements the co-programmed European Partnership on AI, data and robotics (ADRA) and all proposals are expected to allocate tasks to cohesion activities with ADRA and the funded actions related to this partnership under the call CSA HORIZON-CL4-2021-HUMAN-01-02. This initiative will capitalise on these existing initiatives, complement them and ensure integration within the existing ecosystem developed by ADRA.

Standardisation and Knowledge Valorisation

Proposals are invited against the following topic(s):

HORIZON-CL4-INDUSTRY-2025-01-HUMAN-60: Horizon Standardisation Booster (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 1.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 1.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. The maximum amount to be granted to each third party is EUR 60 000.</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²¹⁸.</p>

Expected Outcome: Proposals are expected to contribute to the following outcomes:

- Increased participation of research performers in standardisation activities by establishing a long-term, sustainable link between R&I and standardisation.

²¹⁸ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Increased development and adaptation of standards to meet new industrial needs, particularly in critical technology areas, driven by EU and national research.
- Increased uptake of new technologies through enhanced standardisation activities.

Scope: Standards are crucial in ensuring the safety, functionality, and interoperability of EU products. They help maintain compliance with policy and legal requirements while also enabling access to global markets when they are cutting-edge and established through international organisations. This highlights the important role that standards play in the EU's policy agenda, particularly in initiatives like the Digital Decade, the New Industrial Strategy for Europe, the Commission's EU standardisation strategy²¹⁹, the Communication on Advanced Materials for Industrial Leadership²²⁰ and the Communication on European Economic Security Strategy²²¹. Future Commission actions – whether it is the implementation of legal frameworks like the AI and Data Act or the roll-out of the Commission Recommendation on critical technology areas²²² for the EU's economic security – will depend on standards.

To maximize the impact of R&I, early integration of standardisation, as recommended in the Code of Practice on standardisation²²³, is crucial for aligning innovations with policy goals and enhancing market competitiveness.

This action aims to create a full-fledged standardisation mentoring scheme, by providing expert services to European projects to valorise project results by contributing to the creation or revision of standards. The action should take into account the achievements and lessons learnt of the Horizon Standardisation Booster (HS Booster) pilot, which is running from April 2022 to March 2025. In line with the EU Standardisation Strategy, the HS Booster aims to increase the impact of European standardisation resulting from Horizon 2020 and Horizon Europe projects by designing, launching, and managing a dedicated service for beneficiaries.

To further support the valorisation of project results, the full-fledged Standardisation Booster will assist beneficiaries, primarily, but not exclusively, in the technology domains identified by the Commission Recommendation on critical technology areas²²⁴, whose research results appear to lead to the revision or creation of a standard. This service will involve testing the relevance of their results for standardisation activities.

The premium service concept of the currently running Horizon Booster pilot has a proven track record of providing pertinent support. A similar, high-quality concept is fundamental for a booster successor. It is crucial that such a service increases the number of European standards, compared with the ongoing service scheme. Therefore, the HSbooster.eu platform and tools should be further developed, promoted, and utilised to reach their full potential.

²¹⁹ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A52022DC0031>

²²⁰ https://research-and-innovation.ec.europa.eu/document/download/0fcf06ea-c242-44a6-b2cb-daed39584996_en?filename=com_2024_98_1_en_act_part1.pdf

²²¹ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A52023JC0020&qid=1687525961309>

²²² https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=OJ:L_202302113

²²³ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32023H0498&qid=1678171117168>

²²⁴ https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=OJ:L_202302113

Education and training are prerequisites for a successful and mutually beneficial relationship between R&I and standardisation. A future booster should increase the use of the existing Training Academy, continuously add new elements based on user feedback and data tracking, and be further developed and advertised to enhance usage.

Scaling and full implementation at the member state level are paramount for a booster to create significant and long-term impact. Therefore, besides ongoing and closed Horizon 2020 and Horizon Europe projects, and other EU-funded projects, the Booster will be open to national publicly funded R&I projects. The service will help these beneficiaries engage with standardisation bodies and contribute primarily to the creation of standards through preparation and elaboration of standardisation activities, such as participating in focus groups, setting up new technical committees, drafting technical specifications or technical reports.

Applicants can vary widely, including standard development organisations, research and technology organisations (RTOs), universities, private companies, SMEs, industrial partners, innovation agencies and national metrology institutes. The project may benefit from being addressed by a consortium that is formed by experts in standardisation, able to support Horizon 2020 and Horizon Europe, and other publicly funded project beneficiaries.

HORIZON-CL4-INDUSTRY-2025-01-HUMAN-61: Standardisation landscape analyses tool (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 1.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 1.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²²⁵.</p>

²²⁵ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link:

Expected Outcome:

- Provide an information tool on the standardisation landscape accessible for all actors of the R&I ecosystem which includes a search instrument for standardisation deliverables at national, European and international level;
- Improve valorisation mechanisms for ensuring the market relevance and scalability of R&I results.

Scope: Standards play a pivotal strategic role, serving as the silent foundation of our Single Market, ensuring a high-level of safety, functionality and inter-operability for EU products. They guarantee adherence to policy and legal objectives. At the same time, standards can facilitate access to global markets when they are state-of-the-art and developed within international organisations. This underscores the significant role of standards on the EU policy agenda, including initiatives such as the European Green Deal, Digital Decade, New Industrial Strategy for Europe, the Commission's EU standardisation strategy²²⁶, and the Communication European Economic Security Strategy²²⁷. Future Commission actions – whether it is the implementation of legal frameworks, like the AI and Data Act or the roll-out of the Commission Recommendation on critical technology areas for the EU's economic security – will depend on standards.

To support the valorisation of research and innovation results, it is essential to ensure that investments in R&I fully leverage the substantial benefits of standardisation for policy and legal objectives. In line with the Commission Recommendation on a Code of Practice on standardisation²²⁸, structured information on the existing standardisation landscape should be accessible for R&I actors. This is crucial as available information is fragmented, standardisation processes are often uncoordinated, and financial impacts are insufficiently understood.

Furthermore, the diverse array of standard development organisations contributes to a varied landscape, each with distinct procedures, priorities, and stakeholders. This decentralised approach often results in duplicated efforts, and difficulties in navigating the plethora of available standards. Moreover, the absence of a centralised database or repository makes it challenging for researchers to access relevant standards efficiently, hindering their ability to incorporate standardisation into their research and innovation endeavours effectively.

The overarching objective of the action is to develop a landscape analyses tool supporting all actors in the R&I ecosystem in identifying relevant existing standards. This will enable R&I actors to consider the existing standards landscape as a key state-of-the-art input when planning their R&I project activities, thereby avoiding reinventing the wheel. The tool to be developed shall include mechanisms to keep the standards up-to-date automatically as far as

https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

²²⁶ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A52022DC0031>

²²⁷ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A52023JC0020&qid=1687525961309>

²²⁸ <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32023H0498&qid=1678171117168>

possible. In addition, state of the art standards give new impetus for technological developments and help R&I actors comply with existing regulatory frameworks. Efforts should be made to develop standards that align with international and European standards, as well as with industrial and commerce consortia, to reduce the number of standards and have a broader acceptance.

In order to develop such a comprehensive open-access information tool effectively benefitting a variety of R&I actors, the project should be carried out by experts representing different stakeholders covering industry, academia and standard development organisations.

HORIZON-CL4-INDUSTRY-2025-01-HUMAN-62: Artificial Intelligence for knowledge valorisation (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²²⁹.</p>

Expected Outcome: Proposals are expected to contribute to the following outcomes:

- Swiftly valorise research results by market, society or policy making, powered by AI;
- Tackle the innovation paradox in Europe, by supporting R&I actors to valorise their research through relevant AI tools;

²²⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

- Use AI to deliver valorisation roadmaps, business plans, partnerships and guide market uptake strategies in at least 100 use cases of research-based innovative solutions addressing societal challenges.

Scope: Artificial intelligence and machine learning present enormous opportunities to use scientific knowledge and research results faster and more effectively to create value, develop new products and services and address the needs of our societies. Despite leading in many fields of scientific research, Europe falls short in innovation and valorisation performance (what is known as “the innovation paradox”). Harnessing the power of AI to guide the efforts of researchers and innovators to bring results to the market, make their research more responsive to the needs of society and provide knowledge to inform public policies, can significantly contribute to addressing the innovation paradox. From results scouting to patent drafting, the role of AI to support knowledge valorisation presents ever-growing possibilities.

One of the main reasons hampering valorisation of the knowledge generated by R&I actors in Europe is that researchers and innovators are not always aware of the valorisation opportunities of their research results and may struggle to adopt a concrete plan on how to generate value from their research.

This topic aims to support R&I actors to use AI to support the uptake of research results by market and society. This entails the identification of appropriate existing tools and instruments and the testing of AI -powered valorisation plans in at least 100 cases.

The action will provide an AI -powered valorisation toolbox, which will take into account EU policy and regulations on AI-ethics, as well as social sciences and humanities aspects, and can be used by researchers and innovators to identify the opportunities for valorisation as well as for guiding them towards market and societal uptake. This may include using AI for assessing feasibility under conditions, investigating legal frameworks that may be relevant to the uptake of the solutions, providing guidance on supporting instruments and funding mechanisms, supporting matching with investors, providing knowledge on the sector, investigating institutional and cultural aspects, citizens and consumer preferences. The use of AI may also focus on the efficient use of intellectual assets to raise awareness and guide R&I actors for the smart management of intellectual assets.

The action will also support multistakeholder collaboration for valorisation, by identifying and promoting dynamic stakeholder interaction opportunities to optimise outreach and engagement, e.g. by engaging SMEs, social enterprises, NGOs and local communities. Drawing of the testing of at least 100 cases of AI- powered valorisation from research results to the market, the action will also develop a knowledge base for insights and best practices, principles and guidance to ensure a responsible use of AI for knowledge valorisation benefiting society.

HORIZON-CL4-INDUSTRY-2025-01-HUMAN-63: Value creation pilots for scaling up innovative solutions (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 2.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²³⁰.</p>

Expected Outcome: Proposals are expected to contribute to the following outcomes:

- Increase innovation capacity by drawing on transdisciplinary research and cross-sectoral collaboration to generate economic and societal value;
- Promote the twin transitions, by testing and preparing for scale up at least 10 valorisation pilots, combining research results in a transdisciplinary mode, building multistakeholder collaborations, promoting industry- academia co-creation and engaging with citizens for swifter and human-centric valorisation;
- Enabling more value creation to be retained in Europe, by testing research-based solutions with high potential for scale up.

Scope: Knowledge valorisation is crucial for boosting the Union's industrial competitiveness internationally, strengthening its resilience and fostering its open strategic autonomy. Effective knowledge valorisation enables the Union to create and retain economic and societal value by turning research results to new innovative solutions, benefiting society and creating prosperity for all.

²³⁰ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under 'Simplified costs decisions' or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

The aim of this topic is to strengthen EU capacity to respond to complex and urgent challenges through research and innovation, increase industrial and economic competitiveness and make transdisciplinary research deliver for society. This entails testing the effectiveness of at least 10 transdisciplinary valorisation pilots to “be ready” for scale up across Europe.

The trans-disciplinary and cross-sectoral scale-up pilots will use mature results from research and innovation while simultaneously unlocking untapped value-creation opportunities and promoting collaboration of many different stakeholders from the early stages. Competition among the 10 pilots may be promoted to enhance their quality and help identify the highest potential impact to the Union’s industrial competitiveness, for example through a voting - based mechanism. In the preparatory to the potential scale-up phase, the pilots will also provide new insights to the possibilities and challenges of transdisciplinary approaches to address complex challenges and to the skills, resources and tools needed. Within the scope of the topic are also targeted trainings for cross-disciplinary projects with scale-up potential, as well as other methodological tools and guidelines. This may also include best practices in harnessing the power of cross-disciplinary and cross-sectoral collaboration to enhance capacity, drive innovation, and unlock new opportunities for value creation across industry, academia, and the public sector.

HORIZON-CL4-INDUSTRY-2025-01-HUMAN-64: Pilot initiatives on Technology Infrastructures (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 0.50 and 1.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²³¹.</p>

²³¹ This [decision](#) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link:

Expected Outcome: The projects funded under this topic will have the following expected outcomes:

- Provide evidence and understanding of the European landscape of Technology Infrastructures, including existing facilities and their services;
- Develop a sound understanding of the specific needs of industrial users for Technology Infrastructures;
- Improve availability of Technology Infrastructures facilities and strengthen the provision of services for enterprises across the EU, in particular SMEs and start-ups, with increased opportunities for testing, up-scaling and deployment of new technologies;
- Make Technology Infrastructures in Europe stronger and more resilient with improved, strategic service offer, better adapted to user needs;
- Strengthen the innovation and technology development capacity of the European industry;
- Contribute to the validation of a European approach to Technology Infrastructures, test different strategies and instruments, and their feasibility, to address availability and service gaps at EU level, as well as learn from their implementation experience.

Scope: Proposals should identify a specific technology area or industrial ecosystem in which they will implement the activities proposed for a pilot initiative. This should take into account the selection criteria for pilot actions developed in the final report of the Commission Expert Group on Technology Infrastructures²³² and could cover the priority areas proposed in this report.

The proposals should cover different strategic steps needed to lead to and achieve the expected outcomes, depending on the starting point for the proposed area, building on earlier analysis and consultations.²³³

The proposed actions should lead to a comprehensive understanding of the landscape of Technology Infrastructures, provide evidence of their benefits and added value in the area covered by the proposal, and of any specific needs to improve their availability, accessibility and impact. The actions should also identify possible barriers to addressing the identified needs.

The activities should in particular build on or carry out a detailed mapping of the available Technology Infrastructures in Europe in the pilot area covered by the proposal, and the analysis of main types of services offered and used. The actions should result in an in-depth

https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

²³² Link to the report of the Commission Expert Group on Technology Infrastructures will be provided in due time.

²³³ See the report from the above-mentioned Expert Group.

understanding of user needs for Technology Infrastructures in relevant industrial ecosystems as well as identify the potential gaps in Technology Infrastructures services or mismatch between supply and demand, both in terms of the types of facilities and services offered and their availability across the entire EU. This analysis should consider both the current state of play and a forward-looking perspective, as well as needs of large companies, SMEs and start-ups.

The proposed actions should include development of a strategy, roadmap or agenda with identified measures that would help overcome the existing gaps and barriers. In particular, the actions should identify measures needed to improve infrastructures service provision to industry, including their outreach strategies and pricing policies, facilitate access to these services and increase their visibility, especially across regions and countries, as well as identify potential investment priorities.

Such a strategy could include for example the specifications for new or upgrade of existing TIs, development and deployment of new TI services, developing EU-level networks or ecosystems of TIs with integrated service offers, including both technology and non-technology services (e.g. technical assistance and training services for companies in the technologies and services offered by the TIs, support to standardisation, financing, market analysis or addressing regulatory issues).

The pilot projects should develop proposals for implementation modalities of the proposed strategy, roadmap or agenda, including the part of the infrastructure operators/owners as well as suggested actions and/or support measures at the EU, national, regional level, potentially leading to the establishment of an appropriate coordination mechanism. As a basis, a mapping of already available support measures at EU and national/regional levels should be carried out, as well as identification of relevant actors needed to implement the strategy, roadmap or agenda, and the necessary financial resources, as relevant.

Successful proposals will demonstrate the relevance of the technology areas or industrial ecosystems they choose to cover for EU competitiveness and strategic autonomy as well as the need for action in these areas. They will involve all relevant stakeholders including in particular industrial partners, including SMEs and large enterprises, organisations hosting Technology Infrastructures and other infrastructures offering relevant services for industry, as well as technology, market and legal experts as needed.

Projects should build on or seek collaboration with relevant existing projects and develop synergies with other relevant European, national or regional initiatives, funding programmes and platforms.

HORIZON-CL4-INDUSTRY-2025-01-HUMAN-65: System innovation experimentation for Industry 5.0 (IA)

Call: INDUSTRY

Specific conditions

<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Innovation Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Beneficiaries may provide financial support to third parties. The support to third parties can only be provided in the form of grants. The maximum amount to be granted to each third party is EUR 60 000.</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²³⁴.</p>

Expected Outcome: Proposals are expected to contribute to the following outcomes:

- Demonstrated successful incentives for systemic transformation towards Industry 5.0²³⁵ and for skills upgrading and boosting the competitiveness of EU industries.
- Development and application of Industry 5.0 enabling conditions, processes and methods for systemic transformation, organisational learning capacities and revitalisation of industries at regional/local level.
- Demonstrate / provide evidence on the implementation of Industry 5.0 innovations for better adaptation of industries to new challenges linked to twin transition (enhanced resilience), organisational agility, and contribute to tackling the skills gap / attraction of best talent in regional industrial ecosystems

Scope: Industry 5.0 is a framework grounded in system thinking approach which aims to bolster the economic and environmental resilience of industrial ecosystems and companies and contribute to enhancing the sustainable competitiveness of EU industries.²³⁶ Industry 5.0

²³⁴ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

²³⁵ [Industry 5.0 - European Commission \(europa.eu\)](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf)

²³⁶ European Commission, Directorate-General for Research and Innovation, Renda, A., Schwaag Serger, S., Tataj, D. et al., Industry 5.0, a transformative vision for Europe – Governing systemic transformations towards a sustainable industry, Publications Office of the European Union, 2021, <https://data.europa.eu/doi/10.2777/17322>

innovations such as human-centric technologies or learning organisation models contribute to tackling the new emerging challenges linked to ongoing green and digital transition such as addressing the skills gap, attracting the best talent or accelerating uptake of clean technologies.²³⁷

Proposals should elaborate on an Industry 5.0-driven methodology framework via system innovation experimentation in different industrial ecosystems in European Regional Innovation Valleys and other regions, to support deployment of Industry 5.0 innovations or methods at regional / local industrial ecosystems level:

- a) offer innovative approaches to accelerate industrial transformation at regional/local level while tackling the new emerging challenges such as skills gap or attracting the best talent.
- b) experiment to develop incentives towards longer-term industry 5.0 transformation.

The project should build on the results of the “Community of Practice on Industry 5.0”²³⁸ and other Horizon Europe Industry 5.0 (or related) funded projects. Proposals should involve appropriate expertise in Social Sciences and Humanities (SSH), in particular in systems thinking or complexity science and their practical implementation as part of system innovation or transformation initiatives.

The proposal should include details on processes to identify a concrete long-term transformative innovation challenge for the industrial ecosystems or actors participating, to formulate concrete objectives addressing systemic issues related to how the industrial ecosystem could boost its future competitiveness, and achieve Industry 5.0 goals, and in particular focused on attracting skilled employees, creating the conditions for learning ecosystems or learning organisations. The challenge should guide the next steps on industrial transformation processes and experimentation.

For each of the identified transformation challenge, the project should engage stakeholders in transdisciplinary research and innovation activities, including in:

- a) Identifying and testing new Industry 5.0 driven methods and measures for organisational transformation, learning organisation implementation and system innovation, to support the scaling up of Industry 5.0 and skills for competitive and future-oriented industry transformation:
 - Identifying the package of systemic innovations available to reach the set goals, including advanced technologies designed with responsible practices (human-centric, ecological, bio-inspired, biomimicry, nature-based solutions etc.), business models, new work processes, organisational models, governance or social innovations that can support Industry 5.0 transformation.

²³⁷ European Commission: Directorate-General for Research and Innovation, *ERA industrial technologies roadmap on human-centric research and innovation for the manufacturing sector*, Publications Office of the European Union, 2024, <https://data.europa.eu/doi/10.2777/0266>

²³⁸

- Assessing skills needs and learning areas for the workforce and organisations in the industrial innovation ecosystem, in view of the identified systemic innovations.
- Identifying the incentives, leverage points and / or behavioural aspects that would support the organisations' evolution to industry 5.0, building on existing results of Industry 5.0 funded projects and connected initiatives.
- Identifying successful methodologies to develop systemic innovation incentives to promote Industry 5.0 paradigm change, human-centric enabling technologies, learning organisation model adoption and skills upgrade for Industry 5.0 goals.

b) Developing and testing the new methodologies through sandboxes, open innovation approaches or participatory processes for systemic transformation by prototyping new incentives schemes or enabling measures. The sandboxes should involve quadruple or quintuple helix stakeholders at regional/local level to support the achievement of the identified transformational challenge and contribute to acceleration of place-based industrial transformation:

c) Develop tools/measures to build evidence on and promote the impact of Industry 5.0 methods for industrial transformation at regional/local level, such as:

- Digital or AI-enabled tools to support rapid conversion and orchestration of information that can support decision-making and anticipation of the pipelines of innovations, value chain evolution, skills needs or transformation opportunities.
- Peer learning across the supported ecosystems, focused on the improvement of organisational learning capacity, learning ecosystems development and new innovation capacity for Industry 5.0 transformation, inspired by new paradigms in organisational design, learning and innovation. This should also include actions catalysing leadership for Industry 5.0 paradigm change. Document the results to inform and advise policy-makers in view of their potential upscaling.

Proposals submitted under this topic should include an exploitation strategy.

The project should build on or seek collaboration with existing projects developing Industry 5.0 solutions and/complementary to Industry 5.0 pillars and methods such as Regional Innovation Valleys or New European Bauhaus. It should also develop synergies and ensure complementarities with other relevant European, national or regional initiatives, funding programmes and platforms, such as Digital Innovation Hubs, European Partnerships like Made in Europe, Process4Planet, AI, Data and Robotics Partnership and the relevant EIT KICs.

The Commission considers that proposals in this topic with an overall duration of typically 36 months would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of proposals requesting other durations.

HORIZON-CL4-INDUSTRY-2025-01-HUMAN-66: Assessment of Technology Infrastructure needs in Ukraine (CSA)

Call: INDUSTRY	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 1.50 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 1.50 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Legal and financial set-up of the Grant Agreements</i>	<p>The rules are described in General Annex G. The following exceptions apply:</p> <p>Eligible costs will take the form of a lump sum as defined in the Decision of 7 July 2021 authorising the use of lump sum contributions under the Horizon Europe Programme – the Framework Programme for Research and Innovation (2021-2027) – and in actions under the Research and Training Programme of the European Atomic Energy Community (2021-2025).²³⁹.</p>

Expected Outcome: The project funded under this topic will have the following expected outcomes:

- A comprehensive understanding of the existing landscape of Technology Infrastructures²⁴⁰ in Ukraine, including existing facilities and their services;
- Assessment of the loss of capacities in Technology Infrastructures in Ukraine in result of the Russian aggression;
- A sound understanding of the specific needs of industrial users, including large companies and SMEs, for Technology Infrastructures in Ukraine;
- An investment agenda for Technology Infrastructures in Ukraine addressing the gaps related to the capacity loss due to war and in view of the future technology development capacity of the Ukrainian industry in support of the reconstruction process.
- Identification of Technology Centres in Ukraine that could pilot an integrated approach to the provision of Technology Infrastructure facilities and services Ukrainian companies

²³⁹ This [decision](https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf) is available on the Funding and Tenders Portal, in the reference documents section for Horizon Europe, under ‘Simplified costs decisions’ or through this link: https://ec.europa.eu/info/funding-tenders/opportunities/docs/2021-2027/horizon/guidance/ls-decision_he_en.pdf

²⁴⁰ Add the definition of TIs prior to the final version.

to strengthen the connection between research and industry through technology transfer, lowering the risks for private R&I investments.

Scope: Proposals should put forward a robust methodology to comprehensively analyse the current landscape of Technology Infrastructures facilities and services available in Ukraine and assess the damages to such capacities in result of the war. To this end, the proposed activities should engage with Ukrainian authorities at national and regional level as well as relevant organisations within the R&I ecosystems, such as RTOs, technical universities, research institutes and technology centres, hosting such infrastructures.

Activities proposed under this action should include a comprehensive analysis of user needs for Technology Infrastructures, both in the public and the private sector. This analysis should take into account in particular strategic technologies and long-term development needs of the Ukrainian economy.

This should lead to an analysis of capacity gaps and the mismatch between supply and demand for Technology Infrastructure facilities and services.

Building on these analyses, the project funded under this action will develop an investment agenda for Technology Infrastructures in Ukraine in view of the post-war reconstruction of the country. This agenda should identify priority areas for investments as well as the type of investments that are most urgently needed to foster the innovation capacity of the Ukrainian economy. It could also propose specific large-scale investments in individual facilities, development and deployment of new TI services, developing national networks or ecosystems of TIs with integrated service offers, building partnerships with TIs operating in the EU, as well as other actions strengthening the provision of TI services in Ukraine.

The action funded under this call should identify a set of Technology Centres in Ukraine that would pilot the establishment of an integrated network providing Technology Infrastructure services in selected technology area or industrial ecosystem. Such a network should include a critical mass of RTOs, universities and research institutes, as well as the private sector as relevant, that would develop a joint offer of research and technology services and other business support services to Ukrainian companies. Based on this pilot, the project should also develop a strategy and action plan of scaling-up such networks on regional, national and international levels.

Methodologies proposed under the activities envisaged in this action should take into account the relevant work carried out at EU level as well as build on the experience of EU organisations hosting such facilities. Proposals should ensure strong engagement from all relevant stakeholders in the public and the private sector.

Projects should build on or seek collaboration with relevant existing projects and develop synergies with other relevant national, European or international initiatives on Technology Infrastructures, such as for example Open Innovation Test Beds, Testing and Experimentation Facilities or European Digital Innovation Hubs.

International Cooperation

Proposals are invited against the following topic(s):

HORIZON-CL4-2025-03-HUMAN-19: International cooperation in semiconductors (CSA)

Call: DIGITAL - CNECT	
Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of around EUR 3.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 3.00 million.
<i>Type of Action</i>	Coordination and Support Actions
<i>Eligibility conditions</i>	The conditions are described in General Annex B. The following exceptions apply: Subject to restrictions for the protection of European communication networks.

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- Evidence-based advice to the Commission and the Member States on joint actions with leading semiconductor countries (including Japan, South Korea, Taiwan, Singapore, USA, Canada, and India) in support of EU policies.
- Support to the Commission to define and implement measures aiming at strengthening the position of Europe's industry in the global semiconductor value chain.
- Support to the Commission in implementing actions related to research cooperation, e.g. within the Digital Partnerships.
- Factual elements (e.g. mapping supply chains in leading countries, analyses of state-of-the-art, emerging technologies...) that help the Commission in assessing potential areas of cooperation.

Scope: Within the context of semiconductor and semiconductor-based photonics (e.g. silicon photonics), the CSA will support the Commission and the Member States in the following activities:

- Preparation of a regional mapping of leading semiconductor countries outside of the EU regarding supply chains, industrial strengths, gaps and their expected evolution;

- Identification of emerging opportunities (e.g. technologies, approaches) for cooperation with other regions;
- Definition of research areas in which international cooperation would result in tangible benefits for Europe;
- Analysis of risks to the EU's technological advancements, technological competitiveness, and access to leading-edge technology vis-à-vis international cooperation countries;
- Analysis of risks related to EU economic security in the semiconductor area including due to potential over-capacities for production of mainstream chips²⁴¹, export controls and non-market policies and practices.
- Promotion and contribution to standardisation activities;
- Organisation of joint events contributing to the above outcomes;
- Promotion of mobility of researchers in specific topics (in cooperation with other support schemes);
- Preparation of a comparative analysis of modalities for cooperation and their applicability.

The Commission will actively engage with Member States via the European Semiconductor Board ensuring that their interests and views are taken into account.

Projects are expected to ensure complementarities with projects funded under the following topics:

- HORIZON-CL4-2022-DIGITAL-EMERGING-01-38: International cooperation in semiconductors (CSA)
- Chips Diplomacy Support Initiative - EU action grant in the field of pilot projects and preparatory actions²⁴²
- Chips Joint Undertaking's HORIZON-Chips-2024-3-RIA: Joint call with Korea on Heterogeneous integration and neuromorphic computing technologies for future semiconductor components and systems

And to develop synergies with projects funded under the Digital Europe Programme (DEP).

HORIZON-CL4-2025-04-HUMAN-08: GenAI for Africa

Call: DIGITAL - HADEA

²⁴¹ Mainstream chips denote semiconductor devices manufactured at node sizes equal or greater than 28 nm.

²⁴² See Chips Diplomacy Support Initiative | Shaping Europe's digital future (europa.eu)

Specific conditions	
<i>Expected EU contribution per project</i>	The Commission estimates that an EU contribution of between EUR 1.00 and 2.00 million would allow these outcomes to be addressed appropriately. Nonetheless, this does not preclude submission and selection of a proposal requesting different amounts.
<i>Indicative budget</i>	The total indicative budget for the topic is EUR 5.00 million.
<i>Type of Action</i>	Research and Innovation Actions
<i>Technology Readiness Level</i>	Activities are expected to start at TRL 4 and achieve TRL 6 by the end of the project – see General Annex B.

Expected Outcome: Project results are expected to contribute to the following expected outcomes:

- African societies benefit from innovative solutions on GenAI applied to key areas:
- Local technological companies in some locations in Africa benefit from the technological capacity to develop targeted solutions to unlock the full potential of GenAI Digital in key areas with the primary focus on rural communities in Africa and women, being an underrepresented group but with a key role in the foundation of these societies.

Scope: Generative AI (GenAI) holds the potential of creating in Africa a rich ecosystem of transformative solutions and practical applications addressing the specific societal challenges and opportunities most of the countries are facing.

The proposals should address one or more of the following:

- **Agriculture optimisation:** GenAI can analyse satellite imagery and sensor data to monitor state of crops, soil conditions, and weather patterns, enabling farmers to boost crop yields and enhance food security through sophisticated predictive analytics and efficient resource management like water and pesticides. This is crucial to mitigate climate change and poor irrigation infrastructures in some areas of Africa.
- **Healthcare:** GenAI can diagnose diseases from medical images and patient data, enhancing healthcare in remote areas; forecast disease outbreaks and aid in preventive planning, and with the help of chatbots and virtual assistants can offer medical advice and connect patients with doctors, expanding telemedicine services, making healthcare more accessible to remote populations. Particular attention should be paid to the gender dimension in addressing AI biases, sex-specific healthcare needs, and intersecting gender and racial inequalities in health and access to health services.
- **Infrastructure and urban planning:** GenAI optimises energy usage, integrates renewables, and ensures efficient distribution, while managing water (including groundwater but also rainfall use) and waste (e.g. plastic reduction and reuse) effectively for sustainability,

and enhancing safety with real-time incident detection. It also provides support for reconstruction following natural or human-made disasters. This is vital for some African communities with scarce natural resources like water and facing high temperatures by using Digital Twins on urban and rural areas. All these technological solutions depend strongly on the existence and quality of connectivity infrastructure, as a key enabler for unlocking the Digital and Green Transition.

- **Digital Skills and learning:** Generative AI can personalize learning paths, create multilingual educational content, and offer on-demand virtual tutoring, benefiting rural communities with low resources and fully relying on mobile phones to access online services. Additionally, adaptive learning platforms can use data analytics to tailor teaching, while engineers craft queries to help AI models understand local languages and nuances to set up conversational chatbots for local communities.

The proposals should approach these objectives by:

- Conducting an evidence-based analysis to identify particular needs in Africa that GenAI technologies could solve, for one or several of the topics mentioned above.
- Identifying solutions on GenAI developed in the EU that could be applied in Africa for one or several of the topics mentioned above.
- Based on existing EU-based solutions and particular needs, developing and integrating generative Artificial Intelligence models and algorithms specifically adapted for one or several of the abovementioned key areas.
- Involving and supporting start-ups and local networks in 3 to 5 locations in Africa to create innovative solutions to uniquely African challenges in those areas based on GenAI. Co-creation and living lab methodologies should be explored to boost social uptake of proposed solutions. Living labs are ecosystems of experimentation and open innovation, with a systematic approach to co-creation among their users, whether they are researchers, businesses, civil society or public administrations. These open innovation spaces will enable researchers and local actors from the public and private sectors work together using digital technologies to co-create knowledge and solutions that respond to their societal needs, while improving territorial cohesion.
- The approved projects should take into account the AI Act and GDPR as the main legal frameworks to ensure data protection of the data used within third countries.

Where relevant proposals are encouraged to build on, or seek collaboration with, existing projects and develop synergies with other relevant European initiatives. In particular links are encouraged with the projects funded under international cooperation on AI for public good, in the areas of health, digital twin for reconstruction, emergency response and electric grid optimisation, Destination Earth, Copernicus.

Other actions not subject to calls for proposals

Public procurements

1. Heading 5 of Space - Using Space on Earth – Satellite navigation - EGNSS Evolution Mission and Service-related R&D activities

The objective is to study potential new user needs, as well as the resulting enhancement of services, and determine whether and how the EGNSS programmes Galileo and EGNOS shall evolve to answer these new user needs. This includes the preparation of contributions and technical analysis supporting the EU position in multilateral and bilateral working groups and meetings. The upstream R&D actions in this area will cover the assessment of new mission concepts and of services improvements and of new services or capacities to be introduced based on the user needs, developing the service concept including with international partners when relevant, assessing costs to the programme versus benefits to users and defining the roadmap of activities until an operational service could be provided.

Some procurement actions under this section will affect the essential security interests of the Union. In accordance with Art. 136 of the EU Financial Regulation, restricted participation will therefore be established in the tender specifications on a case-by-case basis.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 2.00 million from the 2025 budget

2. Heading 10 of Space - Boosting Space through training and education activities

The objective is to conduct public procurement activities for the implementation of training and education actions in support of upskilling and reskilling efforts pursued by the European Space Policy, European R&I research agendas related to Horizon Europe.

Support will be given to the successful tenderer for the implementation of the following actions, already developed in a pilot phase in the years 2024 – 2025:

- CASSINI Job Placement Scheme: targeting university students and young graduates, to give them an opportunity to gain hands-on experience through internships in space companies. This action aims to connect academia with industry, in particular new space companies, by providing students and young graduates with practical experience on top of the theoretical knowledge acquired at university. This will help students access the job market. At the same time, it will help industry identify and train prospective future staff. The action shall build on the pilot edition developed in the frame of the STARS*EU project featuring the Space Career Launchpad platform and a voucher scheme for paid internships.

- **CASSINI Space Camp:** targeting students aged 14-18. It is aimed to spark the interest of teenagers to pursue a vocation in space, with a particular focus on New Space. This action will build on a pilot activity to be developed throughout 2024 and 2025. Following the model of Cassini Hackathons, it foresees the involvement of local organisers that will implement each space camp locally in the local language where the space camp takes place. The added value in relying on local organisers is their connection with the local ecosystem and local stakeholders (e.g. schools, universities, companies, museums, planetarium, observatory, etc.) that would facilitate the promotion of the programme as well as the rolling out of the various activities.

In addition, the action will cover the continuation of the EU Space Academy Learning Platform offering space entrepreneurs and enthusiasts a free and customizable online development programme offering online lectures, individual mentoring and thematic workshops.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 5.00 million from the 2025 budget

3. Heading 12 of Space - Boosting Space via support to entrepreneurship – 2025 CASSINI activities

Business development, acceleration and upscaling of start-ups will be fostered across all space areas under the CASSINI Space Entrepreneurship Initiative. CASSINI will provide support to business and innovation-friendly ecosystems, including the strengthening of business skills in the space market segments and digital services based on space data. The objective is to make start-ups and scale-ups investment-ready and able to secure venture capital funding. Synergies with the InvestEU programme and the Space programme will be established. The following two actions will be funded:

- CASSINI innovation support.
- CASSINI Business Accelerator.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 8.50 million from the 2025 budget

4. Digital conferences, outreach, studies and other activities

In addition to calls for proposals, other actions are also expected to be undertaken on specific activities that DG CONNECT will support. These include:

- Other events and publications (e.g. information, communication, dissemination etc.), either through the use of existing Framework Contracts, or the launch of indicatively 25 calls for tenders during 2025. Indicative budget in 2025: EUR 1.5 million.
- Studies including socio-economic and impact analysis studies, and studies to support the monitoring, evaluation and strategy definition for the ICT priority of Cluster 4 in Horizon Europe. DG CONNECT plans to procure via framework contracts and calls for tender. The calls for tenders are expected to be launched in the 2nd and 3rd calendar quarter of 2025. It should be noted that internal outsourcing of studies to other Commission departments based on Administrative Agreements can be used as an alternative to public procurement.
- Policy support activities, including benchmarking activities, evaluation and impact assessments, the development of ad hoc support software, possibly using existing Framework Contracts. DG CONNECT plans to procure via framework contracts and calls for tender. The calls for tenders are expected to be launched in the 2nd and 3rd calendar quarter of 2025. It should be noted that internal outsourcing of studies to other Commission departments based on Administrative Agreements can be used as an alternative to the public procurement.

Indicative budget for Studies and Policy support in 2025: EUR 2.5 million.

Details will be provided in the texts of these calls for tender.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Second quarter of 2025

Indicative budget: EUR 4.00 million from the 2025 budget

5. Conferences, outreach, studies and other activities on AI in Science

The adoption of Artificial intelligence technology and related tools in research and innovation has a tremendous potential to accelerate the discovery process, increase scientific productivity, as well as fast-track innovation processes to have a huge contribution to solving societal challenges. Further understanding and monitoring the impact of AI in R&I is needed. At the same time, it is also important to gauge the potential impact on the research and innovation ecosystems. Other actions are expected to be undertaken on the impact of Artificial Intelligence in R&I. These may include:

- Events and publications (e.g. information, communication, dissemination etc.)
- Studies including socio-economic and impact analysis studies
- Policy support activities, including benchmarking activities, evaluation and impact assessments

Details will be provided in the texts of these calls for tender.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 0.35 million from the 2025 budget

6. Conferences, outreach, studies and other activities on Industry 5.0

Industry 5.0 is a new paradigm promoting a path towards human-centric, resilient and sustainable industry. Active stakeholder engagement and co-creation activities are needed, in order to scale-up the adoption of new practices for Industry 5.0; raise awareness and further develop the concept; support new business models driven by Industry 5.0; and monitor the impact of Industry 5.0 impact on productivity and competitiveness, based on net measures such as net domestic product.

Actions to be undertaken on Industry 5.0 may include:

- Events and publications (e.g. information, communication, dissemination etc.)
- Studies including socio-economic and impact analysis studies - on measures of productivity and competitiveness, based on net measures such as net domestic product.
- Policy support activities, including benchmarking activities, evaluation and impact assessments, taking into account new metrics going Beyond GDP.

Details will be provided in the texts of the calls for tender.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 0.60 million from the 2025 budget

7. Space Events, Studies and Platforms

In addition to calls for proposals and delegated actions, events, studies and online platforms are needed on specific activities in order to assemble, maintain and evolve the EU Space R&I ecosystem. These include:

- Events and publications (e.g. information, communication, dissemination etc.).
- Studies including trends, market and impact analysis.
- Online platforms gathering activities of the EU Space ecosystem, supporting networking, exchange of best practices, analysis for policy-making, etc.

These activities will be carried out either through the use of existing Framework Contracts, or the launch of open tenders. Details will be provided in the texts of those tenders.

Indicative budget in 2025: EUR 0.8 million.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 0.80 million from the 2025 budget

8. Conferences, outreach, studies and other activities on industrial R&I support policies

For the EU to reach the target of investing 3% of GDP in R&D, a significant increase of investments in the private sector is necessary. This requires a better understanding and integration of existing policy tools at European, national and regional levels, showcasing good practices in their application. Recognising the existing gaps, targeted policy measures need to be further developed to support and promote industrial R&I as well as strengthen technology development capacities and support services which are essential for an effective transformation of our industry towards climate neutrality and for strengthening its competitiveness at global level. This requires an active engagement and co-creation with all relevant stakeholders.

Activities supporting a policy toolbox for boosting industrial R&I in the EU may include:

- Events and publications (e.g. information, communication, dissemination, etc.) ;
- Studies including technology assessment and foresight, needs and impact analysis, stakeholder engagement and consultations;
- Policy support activities, including technical support.

Details will be provided in the texts of the calls for tender.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative budget: EUR 0.70 million from the 2025 budget

9. Raw Materials Events

It is envisaged to procure activities for the organisation of events (conferences, workshops or seminars), including the Raw Materials Week through Framework Contracts before the end of 2025.

DG GROW is organising the Raw Materials Week in the fourth calendar quarter of 2025, covering set of events including the High-Level Conference on Raw Materials.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Q4 2025

Indicative budget: EUR 0.80 million from the 2025 budget

10. Update of the Material System Analyses (MSA)

The Material System Analysis (MSA) data sets investigate the flows of materials through the EU-27 economy in terms of entry into the EU, flows through the economy, stock accumulation, incl. end-of-life management. They contain key material specific data and information, to support the monitoring of the circular economy as well as providing useful information for other activities. The MSAs support the RM policy development, and in the mid-term provide a basis for developing sound sustainable resource management strategies. They also contain useful information supporting other activities, such as the monitoring of the circular economy. This action will entail collecting new data and information for the MSA of Critical Raw Materials.

Duration: 15 months

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Q3 2025

Indicative budget: EUR 0.50 million from the 2025 budget

11. Support for studies related to recognised schemes (Article 30, Annex IV) measure in the Critical Raw Materials Act CRM Act

Under CRMA Article 30, scheme owners of CRM sustainability certification schemes may request recognition by the Commission. Recognised schemes may then be used to demonstrate compliance with the sustainability criterion for Strategic Projects. Beyond this immediate relevance, the recognition of certification schemes is also intended to give the Commission a tool to promote convergence and overcome fragmentation of sustainability standards systems by setting out key requirements and granting recognition to those schemes that fulfil them.

There is a need for a service provider to assist the Commission in implementation tasks related to the recognised schemes provisions of the CRMA.

Duration: 48 months

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Q2 2025

Indicative budget: EUR 0.40 million from the 2025 budget

12. Analytical support for studies related to circularity and sustainability provisions under Art. 5 and 34 of the Critical Raw Materials Act

Under CRMA Article 5, the Commission shall adopt, by 1 January 2027, delegated acts to supplement the CRMA by providing for Union recycling capacity benchmarks expressed as a share of the strategic raw materials available in relevant waste streams. There is a need for a service provider to assist the Commission in implementation of this delegated act.

CRMA article 34 sets out that the Commission is empowered to establish delegated acts linked with article 28 to inter alia specify requirements for the technical design and operation of the data carrier, refer to technical standards to be used, set out rules on unique product identifier. There is a need for a service provider to assist the Commission in implementation of these delegated acts. The estimated timing for the adoption of these delegated acts is November 2027 (same time as entry into force of the requirements of Art. 28).

Duration: 48 months

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Q2 2025

Indicative budget: EUR 0.11 million from the 2025 budget

13. Impact assessment of the advanced materials act

Impact assessment of the advanced materials act

Objective: Reflecting the growing importance and demand for advanced materials to support the competitiveness of European industries and the twin green and digital transition, the European Commission will work on an Advanced Materials Act to support the research and innovation process through to manufacturing and deployment, as announced in the mission letter of Commissioner Zaharieva.

The objective of this action is to assess the need for EU action and the potential economic, social and environmental impacts of alternative policy options that could be proposed in the Advanced Materials Act. The impact assessment will collect evidence and assess the need for action, including legislative or non-legislative proposals. It will support the Commission in the design of the advanced materials act. Among other aspects, it must:

- Analyse the problem and problem drivers ;
- describe relevant objectives for the EU action;
- describe policy options, assess their potential impacts and
- suggests how expected results could be monitored and evaluated.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Q4 2025

Indicative budget: EUR 0.50 million from the 2025 budget

14. European Standardisation Panel Survey

Expected outcome:

The European Standardisation Panel Survey (ESPS) will be designed to collect data on standardisation activities of companies. The ESPS aims to create a comprehensive dataset to analyse the standardisation activities of innovation ecosystem actors and to identify trends for use by standardisation policy makers and stakeholders, including standard development organisations. The ESPS will also contribute to assessing how public R&I funding addresses the standardisation needs of industry. The current action is the second edition of the survey.

The ESPS will serve as input for scientific research on the standardisation activities of companies and the implementation of standards, providing essential intelligence for further valorisation policy measures. The survey results can also be used to develop strategies for involvement in European and international standardisation, facilitating the identification of new trends.

The analysis will complement the Code of Practice on standardisation and the first edition of the ESPS by raising awareness of the importance of standardisation for businesses.

Scope:

For businesses, standardisation serves as a strategic tool by preparing the market for a new product, even if the new product is still in the early stages of development.

Despite progress in recent years, standardisation research, with all of its facets – from creation through the development process to implementation – remains less pivotal compared to innovation research. This is primarily due to the lack of comprehensive empirical data, despite excellent theoretical reviews on the topic. Following the successful implementation of the [first edition of the ESPS](#), there is a need to expand the geographical scope by ensuring full participation from more EU Member States. This action will also allow for comparative analytics and trend analysis of the data from the different editions.

Against this background, a second ESPS will be launched to collect and analyse data from European companies and research institutions in the field of standardisation.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Q2/2025

Indicative budget: EUR 0.06 million from the 2025 budget

15. Analytical support for studies related to circularity and sustainability provisions under Art. 4-7 of the Ecodesign for Sustainable Products Regulation (ESPR, REGULATION (EU) 2024/1781)

As part of the implementation of ESPR legislation, the Commission is preparing a Delegated Act on iron and steel products, scheduled to be adopted by end of 2026. This delegated act, in compliance with ESPR Articles 4-7, may include performance and/or information requirements related to circularity and environmental sustainability aspects of steel products and products with high steel content. There is a need for a service provider to assist the Commission in implementation of this delegated act.

Form of Funding: Procurement

Type of Action: Public procurement

Indicative timetable: Q3/2025

Indicative budget: EUR 0.10 million from the 2025 budget

16. International Cooperation

16.1. AI for Public Good 1: Innovative AI-powered cancer imaging solutions for breast and prostate diagnosis

As part of the international cooperation on AI for Public Good in the area of health, innovative solutions are to be implemented for cancer imaging detection relying on AI algorithms that later can be offered to hospitals and clinical centers in need of advanced technologies.

Technical teams will train, test, enhance and optimise existing AI models and algorithms for breast and prostate cancer diagnosis using images. The training will draw upon generative AI and machine learning as appropriate, and will use anonymised data (including synthetic data) from the EU, as well as learn from the experience of the initiatives launched under the European Cancer Imaging Initiative, including EUCAIM. The set of innovative services to be procured through domain experts by the EC for development and testing are:

- Train, test, enhance and optimise existing AI models and algorithms for breast and prostate cancer diagnosis using images. The training will draw upon generative AI and machine learning as appropriate, and will use anonymised data (including synthetic data) from the EU. The AI Act and GDPR legislation will be used as common frameworks to ensure data protection of the data used within third countries. When required, privacy-preserving technologies will be exploited to guarantee data is kept private.
- Sources of, mainly magnetic resonance imaging data will be identified and organised according to ethical and privacy requirements and equipped with efficient and secure

access mechanisms. Transfer learning and domain adaptation will be explored as potential sources to apply the AI models and algorithms to low and middle-income countries.

- Required level of enhanced accuracy of models will be identified and validated, prior to their testing. Testing will be undertaken for each use case (breast and prostate cancer) in low- and middle-income countries to be identified by the applicants.
- Following the tests, the experts will plan and initiate the steps towards regulatory approval of the algorithms, for use in real life scenarios.
- The enhanced AI models and guidelines to their use in diagnosis will be delivered as open access to EU researchers, as well as to stakeholders from other world regions (in particular to low-to-middle income countries).
